ERA 9 Promises and Paradoxes, 1945–Present

Janus (for whom the month of January is named) is an appropriate image for the current era. As the god of beginnings and endings, entrances and exits, his two faces allowed him to look backward as well as forward, seeing the past as well as the future. Historians of this era look backward, as historians must, but with the realization that they also are working at the advanced edge of human history, facing the future. Our task is to examine and bring some order to the history of the immediate past, about which it is nearly impossible to be completely objective. There is an important disjuncture between historical vision, however keen, and the interpretation of events as they approach the present. As Janus is at the very least middle aged, events closest to his gaze are least likely to be in clear focus. The people, places, events, and things that are today considered to be of great historical importance will in many cases be soon forgotten. Other events or persons, now little noticed, will come to be seen as of paramount importance.

Having acknowledged these limitations, we will immediately predict that future historians looking to the post-1945 period will pay particular attention to certain key events and trends. The Cold War, decolonization, the increasing sophistication and breadth of technology, and increasing globalization will assuredly find prominent places in future history textbooks. This era's starting date, 1945, marked the end of World War II and a political and cultural landscape sharply altered and ripe for further change worldwide. Colonized people saw in the increased humanitarian rhetoric of the postwar era and shifting fortunes of colonial powers a chance for autonomy and a dismantling of European imperialism. At the same time, national economies geared for war production shifted slowly to the production that allowed consumer societies to emerge in full force. The scientific and technological research that had marked the war's end with the atomic bomb attacks by the United States on Japan provided a name to describe the newness of the post-1945 era, expressing both its promises and anxieties, that is, the Atomic Age, which soon begat the Space Age and then the Information Age, all such names indicating the primacy of technology and its hold on the imagination.

The Cold War

Despite the wide devastation of World War II, which left more than 60 million dead, many people began the postwar era with great, but short-lived, optimism. The fearful military strength of the Axis powers had been crushed, only to be followed by a new and complex competition.

The two states that emerged as triumphant world powers, the United States and the Soviet Union, appeared unable to easily coexist. Each side promoted an economic system incompatible with the other and promoted its system in the fervent belief that in it was the last best hope of humanity. The U.S.-aligned states championed capitalism, with its ideology of individual freedom matched by free markets, while many also simultaneously expanded the welfare state along a moderate socialist trajectory. The communist world championed central command economies promoting social equality.

The political and military conflict was already evident when the leaders of the United States, the Soviet Union, and Britain met in Yalta in 1945 to discuss the postwar political map. At Yalta, Josef Stalin signaled to Franklin D. Roosevelt and Winston Churchill that the Soviet Union did not intend to withdraw its power or influence from Eastern Europe. By 1947, as elections in Poland were manipulated to support Soviet interests, as the Soviet Union and the United States clashed over the fate of West Berlin, and as a communist insurgency in Greece threatened Western interests, U.S. president Harry Truman issued the Truman Doctrine, insisting that the United States would aid “freedom-loving peoples” anywhere in the world seemingly threatened with communism. While the Soviet Union consolidated its power over Eastern Europe, the aid funds of the U.S. Marshall Plan bolstered West European economies to make communism a less attractive alternative and to increase U.S. overseas markets. By 1947 the Cold War had begun, along with a nuclear arms race and nuclear brinkmanship.

As both the United States and the Soviet Union built up their nuclear arsenals in the immediate postwar period, the world neared nuclear confrontations several times. One of the first followed the outbreak of the Korean War, when Soviet- and Chinese-supported North Korean forces swept past the 38th parallel in 1950. The U.S. military and the Truman administration seriously weighed the option of dropping atomic bombs on targets in the Soviet Union, North Korea, and China as a way to quickly end that confrontation but abandoned it in favor of supporting a plan whereby United Nations (UN) allied forces would protect South Korea and repel North Korean forces. Nuclear diplomacy also was unveiled behind the scenes during the Berlin Crisis of the late 1940s and in the later Berlin crises of the late 1950s and early 1960s when U.S. presidents Dwight D. Eisenhower and John F. Kennedy could only vaguely hint at atomic retribution if the Soviets, with their far superior land armies, made good on their veiled promises to seize control of West Berlin, an isolated Western pocket within the territory of East Germany. The Cold War again almost became hot in 1962 during the Cuban Missile Crisis when the United States learned of nuclear missile installations—capable of targeting U.S. cities—that the Soviets had placed on that island nation. For nearly a week, U.S. ships imposed a blockade on Soviet ships headed toward Cuba, and both sides, with their militaries on high alert, weighed nuclear options. Following the Cuban Missile Crisis, the first treaty talks between the United States and the Soviet Union began to limit nuclear missiles. Atomic diplomacy shifted from direct offensive threats to decisions to limit Cold War military confrontations to the

confines of proxy and confined regional wars, most notably the Vietnam and Afghanistan wars.

As the Cold War became the supreme issue in international politics, it also reshaped the cultural landscape. Both superpowers vied for supremacy not only in nuclear weapons but also in missions to outer space (whether unmanned satellites or spacecraft holding dogs, monkeys, or humans), consumer goods production, science education, and international chess matches. Each of the superpowers wished to lay claim to the mantle of modernity. At the same time, the ideological competition between the communist Soviet Union and the capitalist United States played out in hot spots around the globe, particularly as nationalist movements sought international support and sponsors. One prime example is Vietnam. Following World War II, Ho Chi Minh's decade-long nationalist struggle in Vietnam against French and Japanese imperialism slowly morphed into a Cold War set piece, with the People's Republic of China (PRC) and the Soviet Union aiding Ho Chi Minh in North Vietnam and the United States supporting the procapitalist and nominally democratic government of South Vietnam.

Afghanistan was the last of the proxy battlefields of the Cold War, as Soviet troops and tanks entered Afghanistan in 1979 to support a communist government that lacked popular support, while the United States quietly funded insurgent troops inspired by an Islamist ideology. By the late 1980s, in part a result of enormous Cold War expenditures, the Soviet Union's economy was stretched to its brink, and the Soviet state's ensuing disintegration, official as of 1991, severely altered the political and economic landscape of Eastern Europe, Central Asia, and the Caucasus.

Both superpowers vied for supremacy not only in nuclear weapons but also in missions to outer space (whether unmanned satellites or spacecraft holding dogs, monkeys, or humans), consumer goods production, science education, and international chess matches.

Decolonization

During both world wars, European powers and Japan relied on their colonies for support. The defeat of Japan and the weakening of the European powers left previous colonies or dependent states in a precarious position. For more than a century, a sense of nationalism had been developing across Asia, Africa, and Latin America, encouraging anticolonial sentiments and, in Latin America, protests against neo-colonialism. In India, with an already decades-old independence movement, South Asians had fought on behalf of Britain with promises of autonomy following that war. Postwar independence was delayed as street conflicts approaching anarchy broke out between the country's Hindu majority and Muslim minority; after much rioting and upheaval, India, quickly divided into a largely Hindu India and a Muslim East and West Pakistan, ultimately gained independence in 1947. The founding of India and Pakistan as independent nations signaled the first major

concession of European colonialism over an enormous population and landmass as well as the attendant perils of civil war during partition. Anticolonial struggles worldwide were emboldened, particularly as the newly formed UN and the two new superpowers formally repudiated colonialism (although their own practices were somewhat ambiguous). Between 1945 and 1985, more than 80 countries achieved independence. Some accomplished this with relative ease and little bloodshed; others suffered intense—sometimes genocidal—violence.

Technology and “Progress”

Many of the more dramatic technological advances of the late 20th century had Cold War origins. From the dropping of the first atomic bomb over Hiroshima, the world was gripped with a sense that a new age—the Atomic Age—had dawned. Atomic bombs were horrifying yet awe-inspiring and were celebrated in their own fashion with so-called atomic cocktails and fashion photographs of “Miss Atomic Bomb.” The dreadful backdrop of nuclear holocaust also fit the fervent nihilism associated with art movements such as abstract expressionist painting, bebop music, and later jazz experimentation. The flip side of terror over possible nuclear destruction was utopian dreams of human ingenuity and the eventual benefits of the friendly atom when harnessed to industrial and home energy needs. The consumer abundance spreading across the capitalist West underlined the possibility that technology—and capitalism—could provide comfort and new luxuries. In this sense, the Cold War competition extended from the sphere of the kitchen and on into outer space. Beginning with the Soviet Union’s launch of Sputnik in 1957, the superpowers funded costly space missions, vying for dominance in outer space often as a staged sideshow to advances in missile designs. Yet slowly through the decades, while the military repercussions of space exploration never subsided, space ventures turned from nationalistic spectacles to set pieces for global scientific cooperation.

The space programs also paralleled and intertwined with advances in electronics. As integrated circuits etched on silicon chips replaced vacuum tubes as switching devices and as information processing was miniaturized, the now widely available progeny of the enormous ENIAC computer built for the U.S. military during World War II and its counterparts in Europe slowly fueled a revolution in electronic goods, computing, communications, media, lifestyles, and thought. Machine Age metaphors (“shifting gears,” “accelerate”), rampant since the early 20th century, gave way to Information Age metaphors (“multitasking,” “networking”) in vernacular expressions.

Technology and science also changed the world’s demographics. A far quieter revolution ensued with a base in medicine and public health, as regimented agriculture and the postwar spread of public health measures, including at its most basic level inoculation campaigns, mosquito abatement, and clean drinking water increased lifespans and the world’s population. In this same period, new drug regimens and treatments had

made some forms of cancer and other formerly deadly diseases manageable. The earth's human population of 2.6 billion in 1950 skyrocketed to 6.5 billion in 2005. Average life spans increased, and infant mortality rates decreased to a third of their 1950 levels over this same period.

The Cold War era with its technological advances renewed with new vigor debates over the utopian or dystopian promise of new technologies. Nuclear power provided inexpensive energy but left behind deadly radioactive waste. The fertilizers and pesticides that aided the Green Revolution in agriculture and averted famines also entered groundwater, ecosystems, body tissues, and human breast milk. The demand for oil led to oil spills that devastated wildlife. The comforts and freedom of automotive travel caused unhealthy smog. Industrial production following market incentives led to the poisoning of land, water, and air. Critiques of the new postwar prosperity slowly emerged in academic and popular books and in movements of the 1950s and 1960s that questioned the assumptions and hidden sacrifices involved in "progress."

The environmental movement that emerged in the 1970s gave voice to these concerns. It offered a critique of rampant technology and insisted on an economics of limits and on an ethic based not only on utilitarian concerns regarding human life but also on the needs of the larger living communities of the earth. One of the more profound symbols of this movement was the "Whole Earth" photograph supplied by NASA from the Apollo 17 mission of late December 1972 that revealed the earth as a fragile harbor for life, a blue marble pressed in the darkness of space, revealing an icy white Antarctica and a sandy brown Africa surmounted with white clouds and surrounded with blue oceans. By the early 21st century, concerns for the human impact on the "whole earth" rose, as the likelihood of human-induced climate change, with increasing atmospheric levels of greenhouse gases affecting polar ice levels, sea levels, and climactic patterns shifted from a highly speculative theory to a pillar of policy making.

Globalization and Antiglobalization

One of the characters in Ernest Hemingway's *The Sun Also Rises*, when asked how he went bankrupt, answered, "Two ways . . . gradually and then suddenly." Much the same can be said for the emergence of globalization as a defining characteristic of the late twentieth and early twenty-first centuries. Centuries in the making, globalization defies easy definition. It is based on an evolving technological infrastructure in shipping, transport, travel, communications, and finance that has created worldwide networks and allowed corporations, industries, and other institutions to decentralize and link with partners in formerly remote regions. From these myriad networks, resources, products, and ideas can be transported and changed. People too are a component of globalization, whether tourists or shifting populations of intellectual and physical laborers. International financial institutions such as the World Bank, the International Monetary Fund, and the Group of 8 also

have helped steer national economies toward greater interconnection and dependencies. Ways of life and thought have changed as the local intersects the global.

Globalization challenges older physical, political, and geographical boundaries. On the political front, globalization is marked with the increasing power of nongovernmental organizations (NGOs), including health and charitable organizations such as the International Red Cross, Oxfam, and Doctors without Borders (Medicins Sans Frontieres); political or environmental watchdog groups such as Amnesty International, Greenpeace, or the World Wildlife Fund; and international economic groups such as the World Bank, supranational institutions such as the European Union, and the UN and its myriad organizations.

Such evolving institutions with their multinational bases indicate a challenge to older parochial boundaries between nations and peoples. For some, globalization represents the triumph of U.S.-styled consumerism, while for others it represents the triumph of the multinational corporation over the nation-state. Sociologists speak of global cities with corporate headquarters, consumer centers, and retail chains such as Starbucks and Wal-Mart offering similar products in Brasilia, Boston,

Beijing, and Buenos Aires. Anthropologists insist that the global trend toward homogenization must nevertheless navigate the local, including customs and tastes, hence hamburgers with rice buns in Japan and teriyaki-flavored chicken sandwiches in the United States. Few would still argue that globalization is Americanization. The United States can no longer be regarded as the world's sole transmitter of consumerism. A modern automotive corporation, for

example, might have originated in England; might now be based in Germany; might have factories in South America and Asia, banking affiliates in the Middle East, and phone support in South Asia; might engage in joint ventures with a U.S.-based automotive firm; and might rely on parts shipped from all over the world.

Global migrations and new technologies also encourage global flows of ideas, ideologies, and religions. Since 1945, the efforts of missionaries and grassroots efforts have made Christianity a global faith embraced by one-third of the world's population, with the majority no longer based in Western countries. Despite predictions that African nations would turn away from Christianity following decolonization, Christianity in Africa has instead grown. In 2000 half the total population of Africa embraced some form of Christianity, and Africa remained fertile ground for conversions to Roman Catholicism and Protestant denominations, many of which included syncretic elements such as dance in church services. Since 1945, North American-inspired Pentecostal churches have made large inroads in traditionally Roman Catholic Latin America. Islam has also grown since 1945, following rising birthrates, and has had an increasing impact on politics with the rise of Islamist thought and political agendas. While moderate Muslims advocate inclusion in

Anthropologists insist that the global trend toward homogenization must nevertheless navigate the local, including customs and tastes, hence hamburgers with rice buns in Japan and teriyaki-flavored chicken sandwiches in the United States.

secular societies, Islamists reject the movement toward secularism and instead encourage the creation of governments whose rule is based on the Quran and Sharia. Extremists among these proponents have formed terrorist groups to destabilize contested regions and Western governments.

As people have become more mobile, with larger flows of transnational migration, or as people link electronically on the Internet, personal and group identities too have become more fluid. Globalization arguably has its positive effects, exposing people to new ideas, comforts, and possibilities that may lead to more rewarding identities and lives. In addition to material comforts, cultural productions also have spread, creating common ground, with, for example, hip-hop music devotees in myriad countries. Yet there is a flip side to such spreading cosmopolitanism: a loss of tradition, of cultural norms, and even a loss of a sense of place. The threat of a homogenized landscape and the alienation it can evoke has underpinned leftist critiques and reactionary movements, including terrorism (from ecoterrorism to the significant rise of fringe Muslim terrorism) and older forms of xenophobia, such as anti-immigration movements. Likewise, the benefits of globalization flow toward elite nations (the industrial or postindustrial North) and the elites within nations. As in the unrestrained capitalism of the 19th century, the neoliberal era of global corporations exacerbated the exploitation of natural resources, including people. Mobility of production benefits multinationals while severely undermining the power of labor unions and exploits workers in less developed nations (or the South) coerced or enticed to labor in sweatshop conditions. By late 2008, there were signs of curbs on globalization, as rising oil prices increased transport expenses and made the outsourcing of production less attractive. The economic meltdown that spread globally beginning in 2008, leading to the collapse of banks and lending and increased joblessness, also illustrated the vulnerability of interlinked economies.

The Cold War, decolonization, new technologies, and globalization have been primary shaping forces of world history since 1945. Their effects can be clearly observed when examined on a regional level.

Sub-Saharan Africa

Nationalism, colonialism, and Cold War ideological battles were a volatile mix in post-World War II Africa. As historians Erik Gilbert and Jonathan Reynolds observed in *Africa in World History* (2007), the history of Africa seems to provide the best examples of the “triumphs and tragedies” of the postwar years. At the end of the war, all of Africa was at least nominally under the control of European states except for South Africa (dominated by white settlers), Liberia, and Ethiopia. At the same time, the war had left the imperial powers Britain, France, Belgium, and Italy with devastated infrastructures and wrecked economies. They were not anxious to divest themselves of the colonies that might provide the labor and materials to rebuild. Yet none was anxious to alienate either of the two remaining superpowers, both of which were ideologically

opposed to colonialism (although both employed hegemonic practices that were sometimes tantamount to informal colonialism, or neocolonialism). The United States—officially dedicated to the concepts of free trade and self-determination—promoted the view that Africans who had helped defeat the Axis powers had earned independence. The Soviet Union also supported African independence, holding to the Marxist-Leninist precept that colonies were the highest stage of capitalism. Both superpowers, however, routinely intervened in any instance where they perceived their own national interests at jeopardy.

After the war, Belgium and Portugal tried to operate on a business as usual basis in Africa, but Britain and France attempted to strike a course that would pacify African nationalism and avoid ideological confrontations with the United States and the Soviet Union. European political innovations, primarily consisting of a cosmetic increase in African participation in government (without actually reducing European control), generally fell flat. There was a strong residue of mistrust and hatred lingering from previous exploitation. In the Congo, for instance, the brutality of Belgian rule had been shocking even to the other colonial powers; no superficial changes could erase the remaining acrimony. Resentments lingered toward the less brutal colonial powers as well. Some of their economic innovations resulted in disaster, particularly those that attempted to transport the techniques developed for the heavy soils of Europe to the fragile topsoils of Africa. As an example, a devastating loss of topsoil resulted from the British attempt to use tanks as tractors in the British East African Groundnut Scheme to establish huge peanut farms in Tanzania. As a result of this failed effort, hundreds of thousands of acres of African land lost productive capacity. As would be expected, these disasters intensified the nationalist movements already in progress.

The years following World War II were a period of dramatic political instability and of recurrent violence in Africa. Many Africans had unrealistic optimism about the 51 new states created between the late 1950s and the 1980s. Most of these new countries were based on European colonial boundaries, with little basis in geography or ethnicity. There was no reasonable hope that centuries of competition between groups now united into fragile states would resolve quickly or painlessly. Some governments tried to embrace all of their population, but too often ethnic favoritism left a large number of people angry and dissatisfied. With only rudimentary economic structures and little or no experience in self-government, these new governments were very unstable and were particularly vulnerable to the meddling of erstwhile colonial powers. During the decade of the 1960s alone, there were more than 40 successful insurrections. The United States and the Soviet Union would often play out their Cold War animosities by funding or otherwise supporting opposing sides in these civil wars.

By the beginning of the 21st century, most African states had found ways for their populations to live in peace, but the exceptions are dramatic and bloody. There is little hope that Africa will be entirely free of violence within the near future. Yet there have been many heroic acts

of peacemaking, enabling populations in places such as South Africa and Rwanda to live in relative peace after going through bloody—and sometimes genocidal—periods. There is also a growing international commitment to helping address Africa's problems. Private organizations supported by celebrities or philanthropic groups such as the Bill and Melinda Gates Foundation are investing many millions of dollars to provide health care assistance, stimulate economies, and reclaim lost agricultural lands. There is also wide international interest in helping to reduce or eliminate civil violence and to call into account those who have initiated or exacerbated civil violence. In one example, on July 14, 2008, the International Criminal Court indicted Sudanese president Omar Hassan al-Bashir for genocide.

North Africa and the Middle East

The area stretching across North Africa through the Arabian Peninsula into Pakistan has been the site of conflicting cultural, social, and economic goals since the end of World War II. North Africa had been a war zone from 1940 through 1943 as the Allies attempted to secure a place to launch their offensive thrust into Europe. After the war, there was a powerful resurgence of Arab nationalism. The French attempted to preserve their empire after World War II, but the pull of nationalism and independence proved too strong. After French withdrawal from Vietnam in 1954, Algerians began a bloody eight-year rebellion. Morocco and Tunisia became independent in 1956, and two years later the French government offered independence to colonies agreeing to join an assembly, the French Community. Algeria rejected the option; the prolonged violence eventually led to the collapse of the French Fourth Republic in 1958 and the establishment of the Fifth Republic under Charles de Gaulle.

The French attempted to preserve their empire after World War II, but the pull of nationalism and independence proved too strong. After French withdrawal from Vietnam in 1954, Algerians began a bloody eight-year rebellion.

The establishment of the State of Israel has been the most volatile issue in the postwar Muslim world. Arabs considered the establishment of Israel to be another version of European colonialism. Zionism, the Jewish nationalist movement, had originated in late-nineteenth-century Europe, but only small numbers of Jewish people migrated to Palestine before the mid-1930s. After the devastation of World War II, Jewish immigrants from all over the world went to British-held Palestine, including large waves of displaced persons from Eastern Europe. Yet Palestinian Arabs had been in the area for well over a millennium and, based on promises of self-determination, had expected to form a Muslim state. Regardless of the efforts of the UN to implement a two-state solution to the Palestine issue after the British withdrawal in 1948, Arabs attacked. Israeli troops, many of whom had honed their skills in the European armies of World War II, not only held their ground but also expanded

their borders. Despite international efforts at peace, the ongoing Arab-Israeli conflict currently focused on the contested Occupied Territories of the West Bank still inflames hostility against Israel in much of the Middle East.

Meanwhile, despite U.S. support of Israel, some Muslim states allied themselves with the United States while others allied themselves with the Soviet Union. Cold War confrontations and manipulations kept the area roiling. The Soviet intervention in Afghanistan (1979–1989) unleashed a plethora of Muslim guerrilla warriors, known as mujahideen (such as a young Osama bin Laden) from elsewhere in the Muslim world to fight against the communist aggressor. Members of the ruling elite made fortunes participating in the global economic arena, exacerbating the disparity in the distribution of wealth. Ill-advised attempts at modernization were perceived as attacks on religious values. The combination inspired a backlash that drove many believers to more conservative religious positions. U.S. interventions in the Middle East during the post-Cold War period—particularly its continued support for Israel—created resentment in the region against what was perceived as U.S. imperialism, resulting in increased support for violent extremist groups, such as the Taliban and al-Qaeda (both of which were ironically remnants of U.S.-supported groups in the Soviet-Afghan wars). Acts of terror in major Western cities triggered major military responses by the West, notably the second Gulf War and the ongoing (as of 2009) war in Afghanistan that began on October 7, 2001. Worldwide apprehensions about the region were intensified by the 2009 disclosures of the development of enriched plutonium in Iran. Iran's leaders continue to decry accusations that their goal is to produce weapons of mass destruction, claiming that they are developing such technology for peaceful uses.

South Asia

As with Africa, self-determination failed to bring peace to South Asia (the Indian subcontinent and Sri Lanka). British withdrawal from South Asia and the partition between Hindu India and Muslim Pakistan in 1947 resulted in an overwhelming 10 million refugees. Deaths resulting from the forced relocations have never been completely documented but are estimated to have numbered between 500,000 and 1 million. Five wars subsequently were fought between Pakistan and India, with Pakistan generally aligned with the United States and the officially non-aligned India sharing warm relations with the Soviet Union until its dissolution. The Soviet Union, for example, supported India with large loans during its border clashes with China. The ongoing hostilities also hampered social and economic development in both lands, although the economies of both Pakistan and India, the latter the world's largest democratic state, have been growing since the last decade of the 20th century. India, in particular, since the 1990s has emerged as one of the economic powerhouses of the modern world. The current economic base ranges from subsistence farming through modern agribusiness, industrial production (with much foreign investment), and a strong service

industry. Software development and technology services are a growth industry now.

Off the eastern tip of India, the island nation of Sri Lanka (formerly Ceylon) also won independence from Britain shortly after the war but has not enjoyed the same economic growth as India and Pakistan. The transition from a plantation economy was hampered by an intermittent civil war that was waged for 26 years, beginning in 1983, with Hindu separatists of South Indian heritage called the Tamil Tigers (LTTE) engaged in a struggle against the Buddhist Sinhalese majority. The insurrection was finally crushed in May 2009. All in all, the states of South Asia are only gradually overcoming the disruptions and division that resulted from their colonial past.

East Asia

East Asia—China, Japan, Korea, and Taiwan—has been through astonishing changes since the end of World War II. After World War II, the economy of East Asia was in tatters, with famine and mass starvation occurring across vast regions. By the turn of the century, South Korea, Taiwan, Japan, and China controlled almost 30 percent more of the world's trade than North America (the combined economies of Canada, the United States, and Mexico).

The history of China between 1900 and 2000 has been a roller-coaster ride, swinging between extremes. During that relatively brief period, China went from empire to civil war, from a nearly subjugated people to an international powerhouse, from nationalist right-wing rule to communism, and then to a thriving market-oriented economy. Although both were nominally Marxist, China's relationship with the Soviet Union became tense as disputes over borderlines and doctrine multiplied. China's relationship with India also deteriorated when India denounced China's assertion of authority over Tibet in 1959, setting the stage for a subsequent series of border skirmishes. Despite China's problems in international relations, it survived the tragic mistakes of early communist rule and has prospered economically. As of the summer of 2004, entrepreneurs from the private sector have been eligible to join the Communist Party; many observers now argue that communism now exists in China in name only.

During that relatively brief period, China went from empire to civil war, from a nearly subjugated people to an international powerhouse, from nationalist right-wing rule to communism, and then to a thriving market-oriented economy.

At the end of World War II, Japan's once-powerful empire had been dismantled, along with its industrial productive capacity. War-related death tolls were high: over 2 million civilian and military deaths and at least 810,000 persons whose fate was never learned. Most of the urban areas were bombed and devastated; about 9 million people were homeless. Food shortages were dire; death by starvation was common (over 1,000 died of malnutrition during the first 90 days of U.S. occupation in Tokyo alone). Although the U.S. occupation was aimed at reconstruction

and rehabilitation, only the economic boom created by the Korean War in 1950 prevented a severe depression. By the end of the Korean War, the economic stimulus brought higher wages that allowed food consumption to rise to truly subsistence levels. Although general economic ups and downs have occurred, Japan's economy remains dynamic.

Korea was one of the first battlegrounds of the Cold War. On August 8, 1945, two days after an atomic bomb was dropped on Hiroshima, the Soviet Union declared war on Japan and invaded Manchuria. Seeking an Asian presence, the United States rushed troops to Korea on August 15. The United States and the Soviet Union agreed to divide Korea on the 38th parallel, with the Soviets administering the surrender of Japanese forces north of the parallel and the United States responsible for the south. Millions of Koreans who had lived in Japan or Manchuria during the war flooded back to the peninsula. Separate governments were established, one led by Kim Il Sung in the north and the other by Syngman Rhee in the south. By 1949, both were conducting raids across the border. All-out war broke out on June 25, 1950, when Kim launched an invasion of South Korea with seven divisions. By the end of formal hostilities in 1953, death tolls included at least 1 million North Koreans, 1 million South Koreans, 1 million Chinese, and nearly 37,000 American soldiers. After the Korean War, the area enjoyed a precarious peace, with South Korea developing into an economic powerhouse, while North Korea stagnated. Koreans still speak of reunification, but most observers seriously doubt that the impoverished, rigidly controlled North Korea could successfully integrate with the dynamic market economy of South Korea.

Regions are not only geographical but conceptual, and their defining characteristics fluctuate historically. Scholars debate about placing modern Vietnam into the geographic-cultural category of Southeast Asia because of its historic ties with the Indian Ocean and its societies in East Asia. Conrad Schirokauer and Donald N. Clark, in *Modern East Asia, a Brief History* (2004), include it with East Asia for several reasons, primarily because in the 20th century Vietnam's history has been intertwined with that of Japan and Korea as well as China. The French colonized the land in the mid-19th century, and the Japanese took over after France fell to Germany during World War II. At the war's end, Vietnam was divided between a communist north and a capitalist south. In the 1950s, Vietnam became a hot site in the Cold War, as the United States began its slow involvement that led to military conflict with nationalist communist forces. Following the U.S. withdrawal in 1975, the country united as a communist state. In 1986, the socialist transformation of the economy was declared a failure, and the party established a policy to support an entrepreneurial spirit and encourage people to farm and create businesses for profit. Over the next few years, Vietnam gradually moved toward a capitalist economy with little fanfare and few grand announcements. The economy has been gradually improving since the transition. Ironically, the U.S. goals for Vietnam—a form of democratic government and a capitalist market-based economy—were achieved only after the United States removed its troops.

Southeast Asia

The lands comprising the area that we now call Southeast Asia were, until World War II, considered a rim of isolated, minimally significant countries that evinced traces of Indian culture. Many scholars now include in this geographical area Myanmar (formerly Burma), Thailand, Malaysia, Singapore, Brunei, Indonesia, East Timor, Laos, Cambodia, the Philippines, and Vietnam. During and after World War II, the strategic location of these Southeast Asian states caused international observers to change their perception of the area from a periphery to one of great global importance. As was true throughout Asia, prewar imperialism aroused intense nationalism in local populations. After finding that the post-World War I doctrine of self-determination was being applied to European states only, many Southeast Asian nationalists became disillusioned and looked toward the Soviet Union and later China for support. The area became explosive after World War II. Despite the nationalist sentiments that spread throughout the region, only Myanmar, Indonesia, and Cambodia achieved a significant degree of independence; even they remained vulnerable, to each other as well as to outside imperialism. In fact, Vietnam overtook Cambodia in late 1978 and occupied the country for a decade. Uprisings, coups, wars, and purges have plagued Southeast Asia since the end of World War II but have abated somewhat since the 1990s.

Indonesia, with the world's largest Muslim population, is made up of over 17,500 islands. It was occupied by the Japanese during World War II and declared itself a republic in 1945 but faced violent frictions on many fronts. Some groups denounced "Japanese collaborators," while the Islamic party (the Masjumi) denounced the Marxist and socialist groups. Communists attempted at least two coups. Despite promises made during the war by the Dutch government-in-exile, after the war Dutch forces launched an attack on Indonesian territories. The Independence Preparatory Committee was already in place, and the Japanese-trained Indonesian Army performed well against the Dutch during the hostilities of 1945–1949. Finally, the Netherlands government succumbed to international pressure and acknowledged the sovereignty of the Indonesian government. Achmed Sukarno led the country for its first 15 years, and his presidency was followed by General T. N. J. Suharto (1968–1998). The Sukarno period ended with a violent government response against communists, and the Suharto period was also marred by increasing human rights abuses. Coups, attempted coups, and violence have plagued the state during most of its existence.

Meanwhile, the Japanese had driven the British empire out of the land known as Burma or Myanmar during World War II. The Japanese slogan "Asia for Asians" inspired and excited the Burmese nationalists, but their harsh treatment under the Japanese soon disillusioned them. An underground resistance led by a small band of communists was joined by other groups, soon combined as the Anti-Fascist People's Freedom League (AFPFL). The Burmese drive for independence coincided in time with that of India, and the British decided to withdraw from South

and Southeast Asia and announced elections to the Constituent Assembly in January 1947. From 1948 until 1962, the country existed as an independent republic under the name of the Union of Burma until a military coup overthrew the civilian government. Some pundits argue that Myanmar/Burma's decision not to be a part of the British Commonwealth left it without the protection that might have prevented the military coup.

Russia, Eastern Europe, Caucasus, Central Asia, Northeast Asia

The former Soviet Union and its wider sphere of influence includes present-day Russia, the Caucasus, Eastern Europe, the Baltic region, and Central Asia. Certainly, one of the biggest stories of the second half of the 20th century is the rapid ascendancy to superpower status, the sudden collapse of the Soviet Union, and Russia's steady effort in the past decade to reassert hegemony in the newly independent republics. During World War II, the governments of Hungary, Finland, and Romania joined Adolf Hitler in his declaration of war against the Soviet Union. Bulgaria also was an Axis member. After the war—in which 20 million to 30 million Russians died—Stalin, general secretary of the Communist Party and de facto head of government, insisted that domestic security required that friendly powers govern all countries bordering the Soviet Union. His position was understandable: although few in the West realized the extent of Soviet losses, nearly an entire generation of men had died. The war had destroyed farms along with livestock, farm machinery, factories, and homes. Before the end of World War II, Soviet armies were within reach of Berlin, having gained control of everything between that area and the USSR. The Soviets retained control of the lands they had occupied during their push through German-held areas, but it was not a simple matter of possession. The Soviets eradicated non-communist political parties in Poland, Hungary, Romania, and Bulgaria, yet there had already been a communist faction firmly in place in most East European states. The support of the Red Army ensured the initial success of local communists, and the Soviets kept a watchful eye thereafter. In the region, only Yugoslavia under Marshal Josip Broz Tito was able to retain autonomy during the Cold War.

Conflict between the so-called satellite states and Soviet Russia accelerated after Stalin's death. A revolt in Hungary was crushed in 1956, tightening Moscow's oversight. Soviet intervention also squashed attempts in Czechoslovakia to establish political diversity.

Conflict between the so-called satellite states and Soviet Russia accelerated after Stalin's death. A revolt in Hungary was crushed in 1956, tightening Moscow's oversight. Soviet intervention also squashed attempts in Czechoslovakia to establish political diversity. The failure of economic reform, however, pushed the region into a long period of economic crisis, leading to a collapse of the Soviet Union in 1989. Many volumes have been written—and will undoubtedly continue to be written—about the underlying eco-

conomic weaknesses and mistakes under socialist rule. Soviet hegemony collapsed in 1989, and the Soviet Union itself ceased to exist on December 31, 1991. Not enough, perhaps, has been written about the remarkable restraint with which communist leaders relinquished their supremacy. The area that comprised the former Soviet Union has avoided the sort of large-scale bloodbath that could have ensued. In 1993, Czechoslovakia split peacefully in what has been called a “Velvet divorce” into the Czech Republic and Slovakia. Other areas were not so fortunate. In the former Yugoslavia, rival ethnic groups divided into Macedonians, Slovenians, Croatians, Serbs, and Bosnians, who launched an ethnic cleansing onslaught against Muslim-held Bosnian territories. The UN, the United States, and other European states intervened in 1995 and brought a halt to overt warfare, but resources are thin, and ethnic resentments have been escalating since 2000. Relying on its gas and oil reserves as a source of political power, Russia has reasserted its influence across Eurasia and come into direct conflict with many of the new republics formed after the USSR’s dissolution, most notably the Ukraine and Georgia, a region in which Russia intervened militarily in 2009.

The portion of the Soviet Union that lay in the large area of the traditionally Islamic lands to the north of Afghanistan and Iran (which might be described as western Central Asia) were also reorganized as a result of the collapse. Turkmenistan, Uzbekistan, Kyrgyzstan, and Tajikistan (which was involved in a devastating civil war between 1992 and 1997) became independent in 1991 followed by Kazakhstan, the world’s largest landlocked state, which declared independence on the last day of December 1991. Due to its large oil wealth and large populations of ethnic Russians (known as the “near abroad”), this region remains of geopolitical importance to post-Soviet Russia.

Southern and Western Europe

Two elements characterize the fortunes of Southern and Western Europe after the end of the war in 1945: a sharp contraction in international power followed by amazing reconstruction and economic recovery. The end of World War II marked the end of European world imperialism. As historian W. M. Spellman noted in *A Concise History of the World since 1945* (2006), for about 400 years the European states had projected “Western power, Western culture, Western religion, and Western ideas around the globe.” In so doing, the West had defined the parameters of the modern world. The European colonial edifice cracked in the early 20th century and crashed to the ground in the aftermath of World War II. In 1945, approximately one-third of the world’s population lived in states dominated by imperial powers; that number dropped to less than 0.1 percent by the end of the century. European powers were not pleased to lose their colonies, but most lacked the resources to continue when faced with the triple threat of flagging domestic enthusiasm, opposition from the new superpowers, and increasing nationalism in the colonies.

The largest challenge in Southern and Western Europe was to rebuild their war-torn lands. U.S. secretary of state George Marshall (1880–1959) proposed the European Recovery Program to assist in rebuilding, with the United States providing grants and loans for rebuilding and thus preventing the potential of communist victories in elections. All told, 16 nations participated. The plan was an outstanding political and economic success, resulting in jobs and economic recovery among the participating states. Its trade provisions also boosted the U.S. economy: almost two-thirds of European imports came from the United States. The Soviet Union instituted a counter program called the Council for Mutual Economic Assistance to coordinate rebuilding within the Soviet sphere of influence. Since all the participants had experienced the same devastation in war, there were not enough funds in the so-called Eastern Bloc to compete with the Marshall Plan. The high degree of success under the Marshall Plan served to exacerbate ideological conflicts. Communist parties were very active in the states in Southern Europe for a few years after 1945. There were communist coalition governments in France and Italy, and only British intervention prevented a successful communist takeover in Greece in early 1945. However, as economic prosperity returned, interest in communism waned.

Europeans were conscious of both advantages and disadvantages of the accelerating global economy. In March 1957, Belgium, France, Italy, Luxembourg, the Netherlands, and West Germany signed an agreement to form the European Economic Community (ten years later, renamed the European Community). They enacted provisions for free movement between the member states, eliminated tariffs and other curbs on free trade, and formed political institutions such as the European Parliament dedicated to increasing European economic and political cohesion. The European Union presently consists of 27 members, with 13 members having adopted a common currency, the euro. Whether or not these measures will lead to political integration cannot be easily predicted, but the European Union exerts more influence than any of the member states could have done alone.

Latin America and the Caribbean

As the 20th century progressed, the tensions of the Cold War and other global struggles troubled Latin American states, such as Mexico, Argentina, Brazil, and Chile, intensifying preexisting struggles and bringing new ones. Most of Latin America had little direct involvement in World War II (with the exception of Mexico and Brazil) but continued to suffer from the impact of the Great Depression. From the end of the war well until the present, most of the region experienced intense urbanization as rural agriculturalists migrated to cities, such as Mexico City, Brasilia, and Buenos Aires, that were ill-prepared for the influx. Industrialization lagged, and state involvement in social services was inadequate for the task. Many of the states of Latin America relied primarily on agricultural commodities and the sale of natural resources, such as petroleum ex-

ports, that were subject to wide variations in price. Postwar population escalation outstripped economic expansion, resulting in a dangerously growing unemployed or underemployed population. A wide and dangerous economic and social gap grew between the bulk of the population and the holders of the large rural estates or the wealthy urban elite.

Political developments in Latin America during this period varied widely among the states. Some became more intensely conservative in their support of the economic elite. Some regimes are occasionally described as crypto-fascist, as in the Getulio Dornelles Vargas dictatorship of Brazil and the coalition that created the Concordancia government of Argentina, which survived into the mid-20th century.

The more regressive states, such as Paraguay, often banned or suppressed labor unions or organizations of laborers or peasants. The more industrialized states, such as Mexico, Venezuela, Brazil, Argentina, and Chile, attempted to pacify the urban workforce by acceding to at least some demands.

Representative governments were rare in Latin America, and even those with a claim to republicanism more often represented the interests of the elite. Cuba, as the sole communist dictatorship under the leadership of the charismatic Fidel Castro since the late 1950s, was an exception. By the mid-1960s, some activists and politicians in Latin America believed that Marxism would be the best road to reform, although few if any supported a Leninist or Maoist interpretation. Although appealing to peasants and laborers, the prevailing social, political, religious, and military establishments hotly opposed any local interpretations of Marxism. At the same time, the United States often wound up supporting, in the name of anticommunism, repressive regimes throughout Latin America (such as Argentina, Chile, Nicaragua, and Mexico). By the last decade of the 20th century, military dictatorships had largely been replaced by democratic and constitutional governments throughout Latin America, although there have been occasional threats of attempted coups.

In the Caribbean region, 12 former British territories were decolonized following World War II, and political problems have continued to linger in impoverished countries such as Haiti; the Latin American debt crisis also extended to the Caribbean, where high unemployment has remained an issue. There is a continuing trend in Latin America for states to join in cooperative ventures such as the creation of free-trade zones such as NAFTA, CAFTA, Caricom (Caribbean Community), and Mercosur and continuing pressure on the United States to abandon its isolation of communist Cuba. There also remain problems in some states of Latin America, such as Colombia and Mexico, from powerful criminal enterprises, particularly those involving the international drug trade.

The more regressive states, such as Paraguay, often banned or suppressed labor unions or organizations of laborers or peasants. The more industrialized states, such as Mexico, Venezuela, Brazil, Argentina, and Chile, attempted to pacify the urban workforce by acceding to at least some demands.

North America

On January 1, 1947, Canada became the first of the Commonwealth nations to declare its population citizens of their own state, Canada, rather than British citizens. As in the United States, in Canada there were advances in the political rights of women and ethnic minorities during the postwar years, including the enactment of a largely symbolic Canadian Bill of Rights in 1960 declaring equality of race, religion, and beliefs. In 1969, Canada enacted the Official Languages Act that brought official bilingualism to Canada, making French a coequal language with English. Language was also an issue in the United States, where there were several unsuccessful attempts to enact official English monolingual acts. Both nations continued to move toward official protections for multiculturalism.

Canada supported the United States during the Cold War but not uncritically. Relations between the two became strained during the Vietnam War period. Canadian prime minister Lester Pearson and U.S. president Lyndon Johnson had a personal dust-up over critical remarks made by Pearson at Temple University in Philadelphia in 1965. All in all, about 500 Canadian firms supplied war materials to the United States, and more than 10,000 Canadians volunteered for combat in Vietnam. On the other hand, Canada gave refuge to more than 32,000 American draft resisters and later to nearly 60,000 Vietnamese War refugees. When 52 Americans were taken hostage in Tehran, the Canadian embassy staff hid American fugitives in their homes and also gave official sanctuary to 6 who had eluded capture at the American embassy. About 4,500 Canadians served in the 1991 Gulf War, but Canada declined to participate in the 2003 invasion of Iraq. However, Canada has sent troops to Afghanistan as part of a greater NATO contingent. The giants of North America acknowledge common interests but are not always a united front.

Oceania—Australia, New Zealand, Papua New Guinea, Polynesia, and the South Pacific

A somewhat problematic geographical unit, Oceania covers an enormous area of the South Pacific that includes Australia, New Zealand, Papua New Guinea, and the islands of Melanesia, Micronesia, and Polynesia. The population for the region hovers at around 30 million, with 95 percent concentrated in Australia, New Zealand, and Papua New Guinea. Decolonization, Cold War politics, labor migration, globalization, and environmental issues have shaped the region since 1945. With the Korean War as a spur, the United States offered military protection to much of this region. In 1951, the United States, Australia, and New Zealand formed a mutual defense pact (the ANZUS Pact), which marked the end of British military power in the region. On the periphery of Oceania, the United States also forged a similar pact with the Philippines, allowing naval and air bases, and the United States maintains major mil-

itary bases as well in Guam. In trade, the Southeast Asia Treaty Organization (SEATO) included Australia and New Zealand with the states of Southeast Asia as well as the United States and Britain. In recent years, Australia has developed a closer relationship with China as a result of their growing economic interdependence.

In the postwar period, New Zealand and Australia gradually liberalized immigration policies and by the 1970s had jettisoned rules that limited immigration based on racist standards. Immigrants from the Pacific Islands and Asia became more common, with about 9 percent of New Zealand's population being Asian in the early 2000s.

New Guinea, the world's second-largest island, is divided, with its western half part of Indonesia and the other half in Papua New Guinea, with its population of six million, that gained independence from Australia in 1975. Its governance has been unstable, with one island, Bougainville, granted limited autonomous status in 2000 after a violent secessionist movement. The central government has developed economic and military ties with China. The smaller island nations of Oceania gained independence from European and Western colonial powers in much of this region by the 1970s, with French Polynesia and the U.S. territory of Guam notable exceptions.

Some of the region's continuing conflicts can be regarded as the outgrowth of poverty and the legacy of colonialism. For example, native Fijians and peoples of South Asian ancestry transported to Fiji to work as indentured laborers under British rule have clashed in recent decades over political control of the island; this conflict led to a violent coup in 1987. Along with poverty and racial rifts, environmental issues continue to shape the region: the U.S. hydrogen bomb tests on the Marshall Islands during the Cold War have left a legacy of fallout and contamination. As of 2009, evacuated residents of the Bikini Atoll had still not returned to the island, although tourism has returned. There are still ongoing efforts at cleanup of the soil, which is contaminated with cesium. Many of the islands of Polynesia, notably Tuvalu, have been experiencing increasing salinization of groundwater and cropland because of rising sea levels that may soon make that island nation uninhabitable. Many others are also threatened.

Conclusion

While the year 1945 is an important historical marker, many of the major historical trends that followed 1945 represent continuities with earlier eras. The Cold War and its underlying nuclear terror keynoted the new in science and technology. Yet basic advances in sanitation and medical care also had significant impact on world populations. Reactions to wartime atrocities as well as to Western rhetoric for freedom, including U.S. president Franklin Roosevelt's 1941 address highlighting the "Four Freedoms" (freedom of speech and worship, freedom from want and fear), marked a social shift postwar that registered worldwide. The UN "Universal Declaration of Human Rights" (1948) further encapsulated such concerns. Yet the drive for autonomy in the developing

(and post-Soviet) worlds intensified nationalism and sometimes tragically has led to ethnic cleansing campaigns.

With both the United States and the Soviet Union vying for supremacy in output of missiles and refrigerators during the Cold War, it was not until the advent of the environmental movement in the 1970s that the values underlying Western consumer society faced a serious challenge. One can celebrate the expansion of capitalist ideology as well as consumerism following the collapse of the Soviet Union. Yet there have been strong reactions against unrestrained capitalism and what many perceive as the Westernization of the world. Globalization's boosters view the appearance of a McDonald's or Starbucks in every world capital as a sign of a progressive economy, yet such outlets are a source of irritation for antiglobalization advocates of all stripes.

During the Cold War, it often seemed that the world was on the brink of self-destruction, yet after the September 11, 2001, attacks in the United States on the Pentagon and the World Trade Center and subsequent terrorist attacks in Europe, Africa, and the Middle East, many observers looked back on the era with a degree of nostalgia. Despite the enormous power that the current knowledge base and latest technologies provide, population growth, the threat of famine in the less industrialized nations, environmental degradation (including the threat of disruptions in climate caused by global warming), financial instability, and competition for geopolitical resources offer formidable challenges to existing states and institutions.

—*Fred Nadis, Carolyn Neel, and Jack Waskey*

Environment and Population

Borrowing from the terminology of sociologist of science Thomas Kuhn, the history of environmentalism represents the emergence of a new paradigm, or worldview, in the late twentieth century. Kuhn suggested that when “anomalies” that the standard model cannot explain finally build up, scientists begin to question central assumptions, and a major shift in thought may ensue. Reduced to its simplest formula, environmentalism insisted that nature and its resources could not be taken for granted. The older paradigm, based on the assumption that nature had unlimited resources, ripe for exploitation, came into question.

The sources of environmentalism as a new paradigm for science and for culture at large were many. At its base, however, was the realization that the scientific and technological conquest of nature no longer appeared to simply define progress. The dropping of atomic bombs on Hiroshima and Nagasaki and their devastating consequences established that humanity had the power to wreak havoc on human populations, cities, and the natural order; nuclear fallout could and had disrupted health hundreds of miles from test sites. Polluted air, water, marginal land turned to desert, loss of timber, diminishing natural resources, and biodiversity could no longer be overlooked as negligible side effects of industrial and agricultural productivity. Spaceflight and photographs of earth taken from outer space confirmed the notion that Earth and its atmosphere was a fragile refuge of life, unique in the solar system and perhaps the galaxy. What had once been fringe concerns of wilderness enthusiasts shifted to the center. By the 1990s as scientific consensus on global warming confirmed that human activity was leading to dramatic and likely catastrophic climate shifts, the environmental imperative could no longer be ignored.

But environmentalism had not surfaced out of a vacuum either ideologically or scientifically. What could be described as an environmentalist mentality has deep roots. While celebrants of free markets denied any natural or ethical limits on economic activity, others had always critiqued the more predatory practices of industrialism and the wholesale harvesting of natural resources to the detriment of future generations. Such an ethic gained a scientific vocabulary by the late nineteenth century. Gifford Pinchot, the first head of the U.S. Forest Service, adopted the creed “the greatest good for the greatest number in the long run.” This utilitarian resource management creed soon meshed with an organic theory of nature. In the early twentieth century, the influential U.S. biologist Frederic Clements insisted that a natural system, if undisturbed, reached a harmonious climax community analogous to a healthy organism, whether an oak forest or prairie. This became one of

the central paradigms in the new science of ecology. But as the historian Donald Worster noted in *Nature's Economy: A History of Ecological Ideas* (1977), such ideas, rooted as much in ethics as science, long had served as a romantic counterpart to the imperialist vision of the conquest of nature from the earliest period of the Industrial Revolution. This vision, or ethic, of nature as an organic, harmonious interconnected whole, however, underpins much of environmental belief.

This vision, or ethic, of nature as an organic, harmonious interconnected whole, however, underpins much of environmental belief.

Military interest in the effects of atomic radiation on ecosystems led to intense funding of ecology projects in the United States following World War II. At the same time, many leading ecologists and educators continued to depend on Clements's notions, which suggested that natural systems, when left alone, achieved maximum efficiency and harmony. Such ideas, supported by leading postwar ecologists such as Eugene Odum and his brother Howard T. Odum and that implied an inherent wisdom in nature, became part of the environmentalist arsenal. By the 1970s, however, as these ideas were popularized, many population biologists were rejecting this paradigm and turning to a vision of nature based on chaotic systems and focusing on interspecies competition rather than on organic wholeness; nevertheless, at its formative moment, the environmental ethic and scientific theory appeared in agreement. While the newer ecology undercuts the idea that the "mind" of nature can be interpreted and revealed, it does not dispute the general notion of complex, interactive natural systems; nor does it dispute the critical awareness that human activities can have huge impacts on natural systems.

In the United States and Europe, through much of the early twentieth century, the institutional base for environmental activism was made up of the wilderness preservation and wildlife protection societies such as the Sierra Club, the Audubon Society, and Fauna and Floral International. Many of these groups began at the turn of the twentieth century as elite attempts to curb the more rapacious practices of industrialists and colonialists at the expense of forests and wildlife. These elitist preservation societies gained new momentum in the 1960s and began to merge their concerns with those of consumer protection groups such as the Public Interest Research Groups that Ralph Nader helped found to create legal challenges to corporate practices in the United States. Global protests against radioactive fallout, nuclear weapons, the storage of nuclear waste, and the dangers of nuclear power and agricultural pesticides added to the growing chorus.

During the 1960s, there also was a return to Malthusian concerns about population and resources. Ecologist Garrett Hardin's often-cited 1968 essay "The Tragedy of the Commons" laid the framework by arguing that a market economy and growing population when combined could only lead to disaster. Hardin's essay centers on the premise that a common meadow could support only so many grazing animals and would inevitably disintegrate as more were added to support a growing human population. Yet community members would feel compelled to

add to their herds. Self-interest and free enterprise trumped the long-term common good. Hardin argued that limits to population and use had to be encouraged.

Biologist Paul Ehrlich took up the same cause as early as 1967 in a short essay and in his 1968 book *The Population Bomb*. Ehrlich argued that population growth as well as growing prosperity were directly linked to environmental stresses and were likely to lead to world famines. While Ehrlich's mathematical predictions linking population growth and inevitable famine never proved accurate, his general argument is hard to reject. From 1950 to 2005 the world population has grown from approximately 2.5 billion to approximately 6.5 billion people. According to critics, the Green Revolution's chemical techniques to increase agricultural output and stave off famine in the 1960s were successful in the short term but will eventually exhaust soils and degrade ecosystems. The tragedy of the commons, reconfigured in the 1980s as the quest for sustainability—a term introduced in the 1987 *Report of the World Commission on Environment and Development*—has never been far from center stage.

Worldwide, for example, there is a major concern over groundwater overdraft, that is, the tapping of aquifers at a rate more rapidly than they can be renewed. Demands on water for agriculture and municipalities are ultimately depleting the earth's centuries-old reserves. Private corporations that prospect for water to sell to municipalities and nations are now the norm, as this example of the tragedy of the commons continues to play out. To mention other examples, as agriculture expands, deforestation remains a problem, particularly in Africa and South America. There are similar grave concerns about the sustainability of current fishing levels throughout the world's oceans.

Further, at the close of the twentieth century, the tragedy of the commons became written onto the earth's atmosphere itself, as consensus developed for the reality of human-based global warming. Concerns about global warming gained strong voice at the United Nations (UN) Earth Summit of 1992, while global warming became a prominent issue in 1997 at the Kyoto Summit at which the scientific community affirmed the human causation of climate change. The stalling of the Kyoto Protocol, which required signing nations to place limits on carbon emissions, and the drawn-out post-1997 debate over the reality of global warming indicate that short-term economic and political needs could continue to trump the common good.

The conflict over the Kyoto Protocol also emphasizes the fissure that environmentalism has exposed between the wealthier developed nations, or the North, and the developing world, or the South. Many of the poorer nations of the South questioned why they should be locked into agreements limiting pollution levels when they were still struggling for financial solvency and indebted to the nations of the North. Further, they argued, the North should bear the greater burden, as they were primarily responsible for the environmental

The conflict over the Kyoto Protocol also emphasizes the fissure that environmentalism has exposed between the wealthier developed nations, or the North, and the developing world, or the South.

crisis. With industrializing China and India rejecting the more stringent demands on them that the United States requested, the United States eventually declined to ratify the protocol.

The South's case, in general, has merit. A UN Development Programme report in 1998 indicated that 86 percent of total private consumption could be traced to the 20 percent of the world's people in the wealthiest income levels, while the poorest 20 percent of the world's people were responsible for only 1.3 percent of private consumption. The report also indicates that the top fifth consume 58 percent of energy, while the bottom fifth consumed less than 4 percent. The world's top 20 percent own 87 percent of the world's vehicle fleets, while the poorest 20 percent own less than 1 percent. Environmentalism, in this sense, is a problem that the rich have bequeathed to all the earth's inhabitants in order to maintain a luxury lifestyle and its infrastructure. Given this enormous imbalance, the nations of the South justly point out that the earth's environmental problems have been dumped on them. Other progressive groups argue further that the debt of developing nations is a false issue, as the North owes an enormous ecological debt to the countries whose resources they have plundered.

Perhaps goaded by activists and protests at world trade forums, private environmental groups and transnational corporations have begun to step into the breach. A welcome development in recent decades has been a quickened corporate interest in environmental matters and efforts to recast environmentalism as good business, whether through paradigms of efficiency, the selling of new green technologies, or such innovations as the Kyoto-generated trade in carbon credits. Likewise, groups such as Friends of the Earth International, an offshoot of the Sierra Club, has begun to purchase the debt of developing nations and rechannel it into environmental projects in the developing world. The World Wildlife Federation also has financed preservation efforts in developing countries.

Despite the South's resentment of the North's exploitative economic and environmental practices, the environmental paradigm has spread to most continents. At the 1992 UN Earth Summit held in Rio de Janeiro, more than 150 nations and 1,000 private nongovernmental organizations (NGOs) participated. In 1996 over 100,000 environmental NGOs existed worldwide. The South continues to explore ways to meet the North's demands for debt repayment and environmental responsibility with requests for technology transfers, aid, and the newer lure of ecotourism as an economic engine.

The historically grounded essays that follow assess the growth of environmental awareness and the scope of current environmental challenges. The essays also examine the efforts on the part of environmental organizations, governments, NGOs, and multinational corporations to slow or reverse the tragedy of the commons and encourage sustainability.

—Fred Nadis

■ Introduction: Environmental Challenges

Gathered by prevailing winds and as of 2009 centered at latitude 35 degrees north and longitude 140 degrees west, floats the Great Pacific Garbage Patch, an enormous area of the Pacific Ocean composed of about 3 million tons of the fragmented plastic detritus of industrial society. As this new geographic feature of the earth indicates, the planet's resources are limited and fragile. A reluctant acceptance of this fact in the late nineteenth century and the twentieth century underpinned the new discipline of resource management and ethic of environmentalism. By the twentieth century, myriad dangers to public health and wildlife surfaced that made it abundantly clear that natural resources were finite and subject to deterioration; these included air pollution, soil erosion and contamination, water pollution, loss of animal and plant species, and the winnowing down of the richness of natural environments.

As the twenty-first century began, the reality of human-induced global warming and its likely catastrophic consequences—including rising ocean levels as polar ice caps melt—capped the litany. Even more alarming is the awareness that global warming, a process that proceeds on geological time, may perhaps be slowed but not stopped. The problems of management of the earth's resources and natural wealth remain as a premier challenge for future generations.

—Fred Nadis

Global Warming—Scientific Consensus and Debates

The possibility of anthropogenic global warming, defined as a man-made enhancement of the greenhouse effect, has received much media and scientific scrutiny for several decades. After much debate, the scientific consensus is that anthropogenic global warming is a real phenomenon.

The greenhouse effect is an outcome of the complicated balance between the incoming solar radiation from the sun and outgoing radiation from Earth that regulates the atmosphere's temperature. When an object becomes warmer than -273.15°C (also called absolute zero on the Kelvin

temperature scale and equivalent to -459.67°F), it begins to emit electromagnetic radiation. Therefore, as the sun warms Earth's environment, Earth begins to emit its own radiation. However, radiation is dependent on temperature. The hotter an object is, the shorter the wavelength of peak emission. The much hotter sun emits most of its radiation as visible light. The cooler Earth emits its energy at a much longer wavelength in the infrared spectrum, which human eyes cannot see unaided.

Short wavelength solar radiation passes freely through the atmosphere's molecules and warms Earth. However, as Earth tries to emit this heat back to space in the longer wavelength infrared spectrum, some of it becomes absorbed by molecules in the atmosphere, thus warming the air. A portion is again radiated back to Earth, which warms the surface. In this way, the atmosphere acts as an insulating layer, keeping part of the infrared radiation from escaping rapidly into space. Consequently, Earth's surface and lower atmosphere are much warmer than they would be without this selective absorption of infrared radiation by air molecules. This process is called the greenhouse effect since it is analogous to a glass building that allows visible light inside but prevents some infrared radiation from leaving, keeping plants inside warm. It is important to realize that the atmosphere's greenhouse effect is a natural process, and without it Earth would be a much colder, unlivable planet with an average surface temperature of 0°F .

Certain molecules are more effective than others at trapping infrared radiation. The most important greenhouse gas is water vapor because it strongly absorbs a portion of outgoing infrared radiation and is a plentiful gas. The other main greenhouse gas is carbon dioxide (CO_2), which is equally as absorptive but far less plentiful than water vapor and therefore plays a much smaller role in the greenhouse effect. CO_2 is a natural component of the atmosphere and is produced mainly by the decay of vegetation.

The global warming debate centers on human participation in the greenhouse effect and its long-term consequences. Not only the decay

GLOBAL WARMING TIMELINE

- 1938—Guy Stewart Callendar posits that the burning of coal and oil could lead to increasing levels of atmospheric carbon dioxide and increasing average temperatures.
- 1955—Charles Keeling begins accurate measurements of atmospheric carbon dioxide levels. His data indicates a steady rising curve, since named the Keeling Curve.
- 1957–1958—International Geophysical Year (IGY). Cooperative international scientific studies were initiated, collecting valuable data on geophysics. IGY agrees to fund expansion of Charles Keeling's atmospheric research using infrared gas analyzers. New test sites are established at the South Pole and on Hawaii.
- 1975—Stephen Henry Schneider founds the scientific journal *Climactic Change*.
- 1979—First World Climate Conference, arranged by the World Meteorological Organization, to discuss climate trends.
- 1988—The United Nations and the World Meteorological Organization establish the Intergovernmental Panel on Climate Change (IPCC).
- 1989—Journalist Bill McKibben's *The End of Nature* is one of the first popular accounts describing coming environmental catastrophes, including the dangers of global warming.
- 1990—Second World Climate Conference, Geneva. Several weeks before her resignation as prime minister, Margaret Thatcher speaks at the conference and urges research and policy initiatives to curtail global warming.
- 1992—Earth Summit, or United Nations Conference on Environment and Development, Rio de Janeiro. The agenda included drafting of the United Nations Framework Convention on Climate Change (UNFCCC), which urged nations to begin to limit greenhouse gas emissions.
- 1997—Kyoto Protocol, an amendment to the UNFCCC in which signatory nations agree to limit greenhouse gas emissions within set guidelines.
- 2004—Roland Emmerich's Hollywood film *The Day after Tomorrow* provides an apocalyptic scenario in which global warming leads to the onset of a sudden cataclysmic ice age.
- 2005—Regional Greenhouse Gas Initiative. This initiative of seven eastern U.S. states to cap regional carbon dioxide emissions allows companies with lower emissions to trade or sell their deficits to others that exceed their caps.
- 2006—*An Inconvenient Truth*, an influential documentary film based on former U.S. vice president Albert Gore's lectures about global warming.
- 2006—California's Global Warming Solutions Act. California governor Arnold Schwarzenegger signs this law that mandates caps on greenhouse gas emissions and provides penalties to industries that do not comply.
- 2007—Albert Gore and the IPCC are awarded the Nobel Peace Prize for efforts to curtail global warming.

of plants but also the burning of fossil fuels such as coal, oil, gasoline, and natural gas produce CO₂. Observations show that CO₂ has increased from a preindustrial value of 280 parts per million (ppm) in 1750 to 379 ppm in 2005 (a 35 percent increase). The atmospheric concentration of CO₂ in 2005 far exceeds the natural range over the last 650,000 years (180 to 300 ppm) as determined from ice cores. The annual carbon dioxide concentration growth rate was larger during the last ten years (1995–2005 average of 1.9 ppm per year) than since the beginning of continuous direct CO₂ measurements (1960–2005 average of 1.4 ppm per year). The primary source (80 per-

cent) of increasing CO₂ results from fossil fuel emissions from automobiles, factories, and other power sources, with land-use changes contributing the other 20 percent. Other minor greenhouse gases have also increased in the industrial age, especially methane (CH₄), nitrous oxide (N₂O), and halocarbons, due to agriculture and fossil fuel activities.

Man-made global warming theory states that the greenhouse effect will be enhanced as greenhouse gases increase because more outgoing infrared radiation will be absorbed. There is also the possibility that increasing the temperature will increase water vapor concentrations (the

major greenhouse gas) due to increased evaporation rates, further enhancing warming prospects.

Climate scientists have amassed considerable data supporting the existence of global warming. The years 1906–2005 show a linear trend of 0.13°F per decade warming for global surface temperature. This trend over the last 50 years is nearly double the century trend (0.23°F per decade), suggesting that this warming is increasing. This increase is also larger in polar regions at twice the 100-year average rate. As a result, mountain glaciers, snow cover, and polar ice sheets have declined on average in both hemispheres. For example, Arctic sea ice has shrunk by 2.7 percent per decade, and seasonally frozen ground has decreased by about 7 percent in the Northern Hemisphere since 1900. This melting trend has also contributed to a sea level rise of 1–3 millimeters per year, corresponding to a 4–8 inch rise this century. Ocean water temperatures have also increased by 0.5°F to 1.0°F in the past several decades.

These changes may have impacted weather regimes. Precipitation increases have been observed in eastern North and South America, northern Europe, and northern and central Asia. Drying has been observed in the Sahel, the Mediterranean, southern Africa, and parts of southern Asia. Longer and more intense droughts have been observed over wider areas since the 1970s, particularly in the tropics and subtropics. Finally, cold days, cold nights, and frost have become less frequent, while hot days, hot nights, and heat waves have become more frequent in the last 50 years. Evidence for warming is also observed in seasonal changes with earlier springs, longer frost-free periods, longer growing seasons, and shifts in natural habitats and in migratory patterns of birds.

While Earth has experienced numerous climate swings throughout its history, observations and climate models calculate that the increase of greenhouse gases was caused by recent global warming, not by natural causes. Computer models project that CO₂ has contributed to most of this warming (63 percent), while the other greenhouse gases contributed 37 percent. The computer simulations also generally reproduce the temperature trends and weather regime changes discussed above, providing confidence that the

cause and effect of man-made global warming is real. The water vapor feedback is also consistent with the models. Water vapor has increased since at least the 1980s over land and ocean. The increase is broadly consistent with the extra water vapor that warmer air can hold. The frequency of heavy precipitation events has also increased over most land areas, consistent with the temperature and water vapor increases.

The models predict future warming. Continued greenhouse gas emissions at or above current rates will result in a warming between 3.2°F (best-case scenario) and 7.2°F (worst-case scenario) this century, magnifying current changes and creating new alterations such as slower Atlantic Ocean currents.

Although the skeptics' case has weakened and they do represent a small minority, some global warming critics remain suspicious of the new consensus in the scientific community. Indeed, in the 1970s many scientists claimed that global cooling was occurring because there was a decrease in average global surface temperature during 1945–1968. Global warming skeptics point out that climate models contain uncertainties in cloud processes (a very important contributor to earth's heat budget), do not handle ocean-atmosphere coupling well, and can only resolve coarse atmospheric features. Earlier models also overpredicted the warming, and detractors claimed this as proof that the models had physics flaws. In response, climate scientists later claimed that suspended particles (aerosols) from pollution and volcanic eruptions partially offset anthropogenic global warming, and new models now contain their radiative contribution. Other critics either state that global warming is real but it is due to natural processes or dilute concerns by stating that global warming will be benign and perhaps even beneficial to humans. Proponents of man-made influences have claimed to address these questions, but the debate will undoubtedly continue.

The Debate over Tropical Cyclones and Global Warming

Tropical cyclones pose serious threats to coastal communities around the globe. These large cyclonically rotating storms contain organized thunderstorm activity with a spectrum of increasingly violent wind categories. The possible association between tropical cyclones and global climate change has energized much controversy in the last few years. The Atlantic hurricane season in 2005 inflamed this issue. The 2005 Atlantic season set records for the largest number of tropical cyclones (27), the most hurricanes (14), the most Category 5 hurricanes (3), the most intense hurricane on record (Hurricane Wilma, 882 mb), the most intense storm in the Gulf of Mexico (Hurricane Rita, 897 mb), and the most costly storm on record (Hurricane Katrina, \$150–200 billion). Katrina was also the fifth-deadliest U.S. storm on record (1,500–1,600 fatalities). Indeed, since 1995 most years have witnessed above-normal Atlantic hurricane activity. The period from 1970 to 1994 consisted of relatively quiet Atlantic seasons, suggesting that some kind of climate shift has occurred. Other recent high-impact tropical cyclone events around the globe also support this assertion.

It is well established that water temperatures in most ocean basins have increased by 0.5°F to 1.0°F in the past several decades. Most scientists attribute this to anthropogenic (human-influenced) global warming. The genesis and intensification of tropical cyclones is critically influenced by warm oceans. Therefore, some scientists have postulated that global warming has augmented hurricane activity. Several recent studies have provided evidence for this allegation. One analysis shows that the number of Cat-

Satellite image of tropical cyclone Franklin over the Atlantic Basin on July 24, 2005. (National Aeronautics and Space Administration)

egory 4 and Category 5 hurricanes has increased since 1975. Another study shows that the number of Atlantic tropical cyclones closely parallels the increase of water temperature from the late 1800s.

However, critics point out three main flaws in this proposed global warming relationship. First, tropical cyclones exhibit natural variability in terms of intensity and number. Second, the historical record is not reliable. Both factors make less certain the connection between tropical cyclones and anthropogenic climate change. Finally, other factors besides water temperature affect tropical cyclones, and it is unknown how these other influences will change on a warmer planet.

For example, intense tropical cyclones (Category 3 or higher) in the Atlantic Ocean exhibit multidecadal (20–30-year) variability. It is generally accepted that this oscillatory behavior is due to slow water temperature cycles in the Atlantic, which last 20–30 years. Atlantic hurricane activity tends to be active when this phase has above-normal water temperatures (such as 1945–1970

and starting in 1995), while Atlantic activity is relatively quiet during the cooler ocean mode (such as 1970–1994). Intertwined in these long cycles are El Niño phases associated with warmer than average oceans in the central and eastern equatorial Pacific that last 2–7 years. Atlantic activity is dramatically reduced during an El Niño because it creates Atlantic wind patterns that are hostile to tropical cyclones. In other basins, tropical cyclone numbers are not changed in an El Niño year, but their primary locations are altered consistent with the locations of the shifted warmer water.

Serious questions about the historical record also exist. Prior to the era of satellites, many tropical cyclones were missed entirely. Therefore, all datasets after 1960 on average contain more storms. The intensity of many tropical cyclones is also unknown. Currently, only the United States performs aircraft reconnaissance flights. Only one other basin ever had aircraft measurements (the western Pacific, from 1946 through 1987). When aircraft measurements are missing, most estimates rely on satellite techniques and are known to contain errors. The combination of intensity uncertainty and missing storms makes extrapolating any trends from this dataset problematic.

Finally, while water temperature is the most important factor in tropical cyclone dynamics, many other environmental factors affect these storms. These include the deep warm water; moisture availability; weak wind shear, a source of rotation; and no land interaction or no landfall. Only when all these factors exist can a hurricane reach its maximum potential intensity for a given water temperature. In fact, few hurricanes reach their potential because some inhibiting factor exists. Furthermore, global warming could enhance some negative influences. Therefore, anthropogenic warmer oceans do not necessarily correlate to increased tropical cyclone activity or stronger hurricanes. Climate models give mixed results, although most show evidence for some increase in intensity.

➤ A GUIDE TO TROPICAL CYCLONE CLASSIFICATIONS

Tropical cyclones are classified in terms of the sustained (time-averaged) winds they generate at 33 feet altitude, measured in units of miles per hour (mph) in the United States. Storm intensity can also be categorized by central sea-level pressure, which represents the weight of the air above a given area of Earth’s surface. The standard unit of measurement for pressure is the millibar (mb), although pressure is also popularly measured as the height of a column of mercury supported by the atmosphere’s weight using an instrument called a barometer.

Large, cyclonically rotating storms contain organized thunderstorm activity with a spectrum of increasingly violent wind categories. Systems with maximum sustained surface winds less than 39 mph are called tropical depressions. Once this wind reaches 39 mph, it is a tropical storm. If winds equal or exceed 74 mph, it is called a hurricane in the Atlantic Ocean but referred to with different names in other ocean basins (such as a typhoon in the West Pacific). Intense tropical cyclones are defined as Category 3 (winds of 111–130 mph), Category 4 (131–155 mph), or Category 5 (155 mph and up). Since winds are caused by pressure differences, the more intense the tropical cyclone, the lower the central pressure. A minimal hurricane will have a central pressure around 979 mb, a Category 3 will range between 964 and 945 mb, and a Category 5 will be less than 920 mb.

Recent examples of intense hurricanes that made landfall include Hurricane Andrew (Category 5) in 1992, Hurricane Ivan (Category 3) in 2004, Hurricane Charley (Category 4) in 2004, and Hurricane Katrina (Category 3) in 2005.

Desertification since 1945

Contrary to popular opinion, desertification is not simply the expansion of deserts such as the

➤ SAHEL

The Arabic name “Sahel,” meaning border or shore, applies to the semiarid, transitional zone of Africa between the Sahara to the north and the savannahs to the south, extending from Senegal on the western coast to the east African Horn, dominated by Ethiopia. This climate delivers an average annual rainfall of 6 to 20 inches, mainly during the summer months. The lack of water is intensified by a generally acidic soil that is deficient in phosphate and nitrogen. In late spring when the rains arrive, the region’s seminomadic people plant peanut and millet crops and feed their cattle and goats on the remaining stubble and shrubs. After the wet season, they journey southward to the more abundant but less invigorating grasses in the northern edges of the savannah.

Although once part of the Sahara Desert, this region, because of its location on trade routes across the desert, was the site of the medieval Sahelian kingdoms. In the 1960s the United Nations tried to improve the conditions with deep wells, which may have upset the delicate climate balance to which the natives were accustomed. During the 1970s there was a multi-year drought that triggered an enduring famine, leading to 300,000 to 1 million deaths, a loss of 5 million livestock, and the widespread dislocation to urban existence of numerous Bedouin tribes such as the Turegs. The cause of the drought has been attributed to human overuse of natural resources, natural large-scale climate changes,

Sahara into surrounding lands. Nearly 50 percent of Earth’s surface has experienced the deterioration and degradation of its soil and plant cover. Desertification of our terrestrial ecosystems has been occurring for thousands of years, but it was not until 1949 that the French scientist A. Aubreville decisively linked this process to humankind’s agricultural practices.

Although the ebb and flow of the fringes of the Sahara has impacted northern Africa, Spain and North America have the largest percentage of dry lands and soils affected. Rangelands have suffered from wood cutting and overgrazing, while nonconservation-conscious farming has

multiplied wind and water erosion in areas of adequate rainfall. Lands with limited water conditions tend toward salinization of the soil, even when irrigation is possible. All this has led to the loss of nutrients, the alteration of soil structure, changes in macro and micro plant species, and the limiting of productivity of profitable crops. This process has been accelerated by thoughtless recreational practices, strip mining, and aggressive urbanization. Except for Antarctica, every continent has evidence of desertification. Although droughts increase the likelihood of desertification, proper land management practices since 1945 have altered the destruction in some

areas and can aid land recovery in others if the sociopolitical will is present.

Global Deforestation since 1945

Human beings have cut trees for crop production, pasture, building materials, and firewood for centuries, sometimes destroying forests in the process. The growth of the human population from 1 billion to 6.5 billion over the past 200 years has pushed the rate of deforestation to alarming levels, especially in coastal and low-land areas. For example, Brazil has lost nearly 90 percent of its Atlantic forest, one of the world's richest regions for species diversity, while West Africa has lost more than three-quarters of its forest. Deforestation contributes substantially to biodiversity loss and to increased levels of atmospheric CO₂.

The destruction of tropical rain forest is a particular concern. According to the National Academy of Sciences, one four-square-mile patch of tropical rain forest may contain up to 1,500 species of flowering plants, 750 species of trees, 400 species of birds, 125 species of mammals, and 150 species of butterflies. South America's Amazonian tropical rain forest, the largest in the world, shelters an estimated one-third of the world's plant and animal species. With perhaps 30,000 unique species of plants, it is a valuable source for new medicines. About 20 percent of the Amazonian forest has already been lost. An ever-growing number of land-hungry farmers slash and burn the forest, and powerful commercial firms clear-cut huge tracts, selling logs at sub-

Timber workers sitting on tree trunks in the threatened Amazon rain forest of Pará, Brazil. (Corel)

sidized prices and converting forest into pasture and crop land for soy and other export products. Careless and indiscriminate logging practices contribute greatly to the problem. In one study in Brazil's Pará state, forest canopy was reduced by half, and a quarter of all trees were damaged or destroyed by loggers who were seeking to harvest only 1 percent or 2 percent of the trees. With an annual loss of about 93 million square miles, tropical forest now covers only 2 percent of the globe.

The slow-growing circumboreal taiga, which accounts for about 25 percent of the world's intact, closed-crown forest and 8 percent of its total forest, is also threatened. About three-quarters of this boreal forest can be found in Russia, especially in Siberia. Enormous fires destroy hundreds of thousands of acres there every year. Some are set by rogue timber companies in order to purchase cheap leases to log the damaged forests. Canada, which has most of the remaining boreal forest, protects about 8 percent of its forest, but single companies have purchased logging rights to areas that exceed New York state in size. Wood from these ancient Canadian forests is often used to make tissue products, newsprint, and paper for advertising catalogs, mostly in the United States. Regeneration of boreal forest generally takes a long time because of harsh climate and poor soil.

The fragmentation of large forests into smaller tracts can accelerate the numerical decline of

► THE AMAZON RAIN FOREST

The Amazon rain forest is the largest and most species-rich tropical forest in the world. It encompasses over 2.123 million square miles (5.5 million square kilometers) within nine nations. It is the largest rainforest in the world and home to tens of thousands of species and a great variety of human indigenous cultures. Estimates show deforestation rates in the Amazon averaging about 7,335 square miles (19,000 square kilometers) per year during 1998–2007, though recent trends have shown a significant decline. Deforestation is caused primarily from slash and burn techniques used for subsistence agriculture and cattle ranching. Much of the region has long been viewed as communal land, providing subsistence for local people. This has proven an obstacle to conservation efforts, as foreign pleas for environmental protection are often seen as affronts to local sovereignty. The Brazilian government noted a nine-year high in deforestation in 2004 with the loss of 10,571 square miles (27,379 square kilometers) of forest. This destruction of habitat continues to threaten the region's biological wealth and has already had a measurable negative effect on the global environment. The large-scale loss of flora has disrupted the amount of carbon dioxide that is recycled into oxygen, further contributing to global warming.

some species. The brown-headed cowbird, for example, enters fragmented forest in North America, parasitizing the nests of warblers and other neotropical migrants that are already in decline because of habitat loss in both their summer and winter grounds. In Borneo, where much of the forest has disappeared, pygmy elephants and orangutans may be unable to survive in the small forest fragments that remain.

Many countries have tried to protect some of their remaining forest. Brazil plans to create 80 parks and preserves that will equal California in size. Brazil's Tumucumaque Park, the world's largest protected tropical forest, is four times the size of America's Yellowstone National Park. However, few governments have made forest protection a consistent priority, especially in the developing world, and logging with or without the government's consent often continues in for-

ests that are protected on paper. In Indonesia, where much of the forest has disappeared, an estimated 70 percent of all harvested logs are cut in lands that are theoretically protected. The current rate of deforestation in Indonesia is two to four times the rate of natural regrowth.

Deforestation contributes to soil erosion, declining water quality, and the buildup of greenhouse gases in the atmosphere. Pasture and cropland store less carbon than forests. Felled timber releases carbon dioxide as it burns or decays and disturbed soils also produce carbon dioxide from burned organic matter.

The human population may reach 9 or 10 billion during this century, so relentless pressure on the world's forests will continue. Moreover, much of the increase will occur in tropical forest regions. Further declines in human fertility rates, especially in the developing world, more effective protection of remaining forest tracts, and a willingness to use sustainable forestry practices and to recycle forest products can help protect remaining forests. If carbon credits become widely available, countries that reduce deforestation below baseline levels may be able to sell their credits to others, thereby benefiting financially from their efforts to curb deforestation. International organizations such as the Nature Conservancy, the World Wildlife Fund, and Conservation International will continue to play critical roles both by protecting land and educating the public about the importance of conservation and environmental protection.

Industrial Pollution since 1945

An unwanted by-product, industrial pollution from both factories and mobile sources fouls the air, contaminates the soil, poisons the water, and warms the planet. Industrial pollution, which has become global in scope and impact only

since the mid-1900s, has caused or contributed to a number of worldwide trends, especially the following: climate change from increasing greenhouse gas emissions; stratospheric ozone depletion; increasing acidification of rain, freshwater bodies, and oceans; increasing use and misuse of chemicals; increasing solid waste generation; reduction in and degradation of natural areas (with a corresponding loss of biodiversity and human cultural diversity); and disruption of biogeochemical cycles. These trends exacerbate the continuing decline and in some regions decimation of the ecological systems that nurture and sustain all life on Earth.

Although volcanoes, forest fires, and dust and sand storms can cause serious air pollution, sometimes with worldwide impact, air pollutants resulting from the combustion of fuels—especially the burning of coal and petroleum products since 1945—have profoundly impacted human health and the environment. Factories, automobiles, and diesel trucks became significant contributors to urban air pollution (and noise pollution), adversely impacting most large cities throughout the world during and since the second half of the twentieth century. As of 2008, fossil fuel-burning power plants worldwide annually emit billions of tons of carbon dioxide (a principal greenhouse gas), soot (particulates), sulfur oxides, nitrogen oxides, carbon monoxide, and hydrocarbons. Other air pollutants produced by industrial sources such as steel mills, refineries, smelters, and petrochemical plants include a variety of toxic substances, such as mercury, lead, arsenic, and other heavy metals, volatile organic compounds, and other hazardous organic chemicals.

Industrial land pollution entails the deposition on land of solid wastes that do not naturally decompose quickly (or at all) such as bottles, cans, plastics, paper, diapers, electronics, and used cars as well as hazardous wastes, including chemical wastes that are toxic, carcinogenic, mutagenic, or teratogenic (cause fetal malformations) or that exhibit the characteristics of ignitability, corrosivity, or reactivity. Other examples of industrial land pollutants include oil, gasoline, and solvents that leak from storage tanks. Among the most serious chemical pollutants are persistent and bioaccumulative substances, includ-

View of the heavily-polluted Calumet River flowing through an industrial zone south of Chicago. (Environmental Protection Agency)

➤ LOVE CANAL

In 1947 Hooker Chemical and Plastics Corporation bought an abandoned canal near the town of Niagara Falls. After filling it with industrial waste products, they sealed the canal with clay. Soon after, the city purchased the land and built 100 homes and a school on the site. Although Hooker Chemical initially refused on the grounds of safety, they eventually sold the property for one dollar after being threatened with seizure through eminent domain. In 1978 after the clay seal had been breached several times, resident Lois Gibbs began to wonder if chemical leakage was responsible for her children's recurring health problems. Her subsequent protests garnered national attention. It was discovered that the toxic waste sealed in the canal had leaked into the groundwater and endangered the local community. An emergency was eventually declared by President Jimmy Carter in 1979, and those living closest to the site were relocated. The Love Canal disaster eventually led to the creation of the Superfund Act in 1980, providing funds to clean up Love Canal and other toxic sites.

ing halogenated hydrocarbon pesticides such as dichloro-diphenyl-trichloroethane (DDT), aldrin, and dieldrin and toxicants such as polychlorinated biphenyls (PCBs), which, even at very low concentrations as land or aquatic pollutants, can increase the risk of cancer, birth defects, and

➤ INDUSTRIAL POLLUTION SINCE 1945 TIMELINE

- Mid-1940s—Brown, acidic, photochemical smog begins to plague Los Angeles.
- 1952—Pollution-embedded London fog causes an estimated 4,000 deaths over a five-day period.
- 1957—Strontium 90, a radioactive isotope created by nuclear explosions, is found in people around the world.
- 1962—Rachel Carson's book *Silent Spring* alerts the public to worldwide dangers of the widespread use of pesticides.
- 1972—At the first United Nations Conference on the Human Environment, Sweden first raises the need to control long-range transport of industrial air pollutants, particularly acid rain.
- 1974—Chlorofluorocarbons (CFCs) are identified as destroying Earth's ozone layer.
- 1980—Residents in Love Canal, New York, discover that poisonous cancer-causing industrial chemicals improperly disposed of decades earlier have been leaking into their homes.
- 1984—In Bhopal, India, a release of 40 tons of methyl isocyanate gas from a pesticide manufacturing plant kills thousands of people.
- 1989—Basel Convention on the Control of Transboundary Movements of Hazardous Wastes and Their Disposal adopted.
- 1990—Forty-nine Nobel laureates identify threats from global warming caused by greenhouse gases.
- 1999–2007—A deep brown cloud three kilometers deep regularly develops over vast parts of East Asia.
- 2007—United Nations Environmental Program GEO-4 report finds that global climate change accelerates the warming particularly of Arctic and Antarctic regions and the acidification of global oceans; increases the intensity of storms and droughts; and impacts freshwater availability and quality, surface water runoff and groundwater recharge, and the spread of waterborne disease vectors.

genetic mutations in fish, birds, and people through biomagnification a million times up the food chain as they build in body tissues and organs.

Factories have always discharged wastes into nearby waterways. Just as Great Britain, Germany, the United States, and Japan all suffered from severe river pollution as they industrialized in the nineteenth century, Russia, China, India, and Brazil have suffered even more from despoiled waterways as they have industrialized since the mid-twentieth century. In each country, factories such as iron and steel mills, power plants, refineries, paper mills, and petrochemical plants and natural resources facilities, including mines and smelters, have discharged huge amounts of water pollutants. The pollutants include the same toxic heavy metals and hazardous organic chemicals that those sources emit to the air and dispose of on land. The water pollutants have destroyed fish, shellfish, and vegetation; irreparably altered stream ecology; and rendered water unusable for drinking, industrial, or social purposes. Many pharmaceuticals and manufactured personal care products, often entering sewage via human excretion, also pollute streams and rivers. Moreover, there is emerging public concern over manufacturing by-product contaminants called endocrine disruptors (e.g., TCDD, a form of dioxin) that mimic hormones in animals (especially fish) and can alter sexual characteristics and functioning. Water pollution damage impacts aquifers and extends well out into the oceans. Fishermen and farmers have suffered the greatest economic loss caused by water pollution.

Toxic Waste

Massive industrialization in the developed world, particularly in the production of industrial, chemical, and consumer goods, often results in toxic wastes as by-products. Such wastes, often posing detrimental and irreversible damage to the environment, have to be stored and/or disposed of in ways that have minimal consequences to the local community in which their processing takes place. Significant events whereby corporations irresponsibly (or even purposely) have dumped or stored toxic wastes (Love Canal in New York, 1978; Seveso disaster in Italy, 1976) have led to increased monitoring and regulations in much of the developed world. One unfortunate solution, however, has been to export waste products to the developing world. Pressure from nongovernment organizations (Greenpeace) and coalitions of developed and developing countries (Group of 77) have led to international law restricting such exports. Nevertheless, many corporations circumvent such regulations.

Since the end of World War II, toxic waste disposal and storage has been increasingly controversial and subjected to numerous regulations. The Love Canal incident in New York state, which involved the illegal dumping of toxic wastes from the 1920s to 1952 on land that later became a suburban housing development and a public school became a national controversy in the late 1970s when people in the community developed various diseases due to the contamination of the local environment. Similarly, in the early 1980s, waste from the cleanup of the Seveso disaster in Italy was illegally shipped to France. This attracted mass attention to the problem of handling waste products in Europe. Furthermore, within specific low-income communities in the United States, often populated

➤ E-WASTE

Almost as soon as a computer leaves the showroom or the shop at the point of purchase, it is already obsolete, given the rapid advances in personal computer technologies. The multiple components that make up a computer (CPU, monitor, peripherals) are typically upgradable within months of purchase, prompting consumers to buy new devices as rapidly as possible. In addition to these, old televisions, DVD players, and VCRs also experience rapid turnaround or breakdown. This results in the vast accumulation of what is known as e-waste, which due to the chemical composition of electronic implements (i.e., lead, mercury, and lithium) is extremely hazardous to the environment because it pollutes soil and the water table and releases gases in the decomposition process.

In many developed countries, particularly the United States and the European Union, there are currently strict prohibitions regarding the disposal of e-waste, encouraging consumers and companies to recycle these products. However, many of these recyclers often sell much of this waste overseas, typically to countries in sub-Saharan Africa or China where these components are broken down for reuse, the extraction of gold and copper wiring, and other elements. The unregulated nature of the international recycling market in e-waste allows many of these recycling firms to sell their wares abroad for a hefty price. The extraction of these components, typically done in large outdoor heaps and sometimes by young children, is extremely hazardous to human health and the environment. However, the lack of international regulation and the accumulation of massive amounts of e-waste in the developed world continue unabated.

—Abraham O. Mendoza

either by indigenous people (Native Americans) or socially marginalized ethnic groups (blacks and/or Hispanics), charges of environmental racism are leveled when government agencies and corporations build toxic waste disposal sites in the proximity of such communities. These situations have led to increased domestic regulation of toxic waste storage and disposal in the United States (Superfund, 1980; stricter EPA regulations) and the European Union.

In contrast, rapidly industrializing nations such as China, seeking to catch up with the rest of the industrialized world, as of 2009 had almost no controls over toxic waste, allowing factories to dump large amounts of chemical by-products into domestic water sources. The Amur and Sungari rivers in China, in the heavily industrialized northeast, are increasingly poisoned by the constant influx of chemicals, wastes, and by-products dumped by factories. Toxic water from the Amur River used at a factory in Jilin caused an explosion in November 2005, illustrating the gravity of the problem.

The export of toxic wastes from the developed world into the developing world, aided by corruption, lax regulations, and loopholes, has led to increasing controversy and greater international regulation concerning such issues. The infamous *Khian Sea* (1986) and *Karin B* (1988) episodes, in which cargo ships loaded with hazardous wastes searched for foreign ports in which to dump their noxious cargos, stirred international attention. Foreign traders in toxic wastes often have sought out African countries, such as Guinea-Bissau and Kenya. Many of these incidents are immediately brought to international attention by Greenpeace as examples of the toxic colonization of the developing world at the hands of multinational corporations. Such companies, headquartered in the West, allegedly utilize duplicitous practices, such as selling waste as fertilizers or recyclable goods, as means of smuggling hazardous waste into unsuspecting countries under the impression that they are purchasing legitimate products. Blame or liability cannot easily be established. Many of these shippers cannot be linked to the producer of the waste due to the chaotic exchange that occurs between traders.

The Basel Convention on the Control of Transboundary Movements of Hazardous Wastes and Their Disposal of 1989 was designed with the intention of restricting the trade of toxic waste from the developed to the developing world. The Basel Convention also focused on reducing the quantity and toxicity of wastes at their source in order to ensure their subsequent management and minimize environmental degradation. Furthermore, the Basel Convention assists developing countries in the development of

adequate management of wastes, utilizing environmentally friendly techniques. However, as of 2009, the United States, has refrained from signing the Basel Convention, thereby allowing the producers of toxic waste to circumvent such international efforts.

Dams—Aswan in Egypt and Three Gorges in China

In the latter half of the twentieth century, large-scale infrastructural projects were undertaken in many postcolonial developing countries under communist or communist-backed regimes. For the purposes of modernizing their economies, countries such as Egypt and China built dams to harness their river systems to create massive irrigation projects, establish hydroelectric facilities for power, and eliminate endemic annual flooding. Among the most notable of these massive national projects are the Aswan Dam on the Upper Nile River in Egypt and the Three Gorges Dam on the Yangtze River in the People's Republic of China. However, as beneficial as these projects have been for the development of their respective national and regional economies, they have also caused irreparable environmental damage and displaced peoples whose livelihoods depended on the annual silt deposits of these rivers.

Egyptian nationalist Gamal Nasser came into power in 1952 with the desire to oust British influence and modernize Egypt. After initially courting both the United States and the Soviet Union for help with construction, he eventually settled on Soviet financing and technical assistance for the purpose of building a dam in Aswan, located along the Upper Nile River near the border with Sudan. In 1958, in order to expand its influence in Africa during the Cold War, the

Soviet Union funded the dam project and provided equipment and technicians. Two dams straddle the river, the newer Aswan High Dam (construction began in 1960, and the dam was completed in 1970) and the older Aswan Dam (Aswan Low Dam built by the British in 1902). The purpose of the new dam was to prevent annual flooding along the banks of the Nile, for which the old dam was inadequate. Annual flooding, while destructive, also brought nutrients and minerals in the form of silt that made adjacent regions ideal for farming, particularly cotton (an important cash crop export for Egypt). However, due to population growth in the regions surrounding the river, flood water needed to be curtailed to prevent damage to adjacent farmland and cotton fields. In addition, the new dam has generated electricity and provided reservoir water for agricultural development farther inland.

Construction on the Three Gorges Dam, originally proposed by Chinese statesman Sun Yat-sen in 1919 and suggested after a survey by the U.S. Bureau of Reclamation in 1944, was delayed until 1994 due to episodes of political unrest and disagreement over the necessity of the dam. Located along the Upper Yangtze River in the central Chinese province of Hubei and expected to be completed in 2011, the Three Gorges Dam is the largest dam project in the world. Much like the Aswan Dam, the Three Gorges Dam was built as a massive infrastructural project aimed at preventing flood damage, harnessing hydro-electrical power for nearby regional economic development, and providing drought relief through the containment of reservoir water for irrigation and agricultural output. The government of the People's Republic of China has poured huge amounts of resources, investment, and manpower into the project, hoping in so doing to develop the economy of the central regions of China. The total electric-generating capacity of the dam is expected to be 22,500 megawatts, making it the largest-capacity hydroelectric power station in the world.

While the Aswan Dam and Three Gorges Dam, ideally, will provide invaluable economic benefits for their respective national economies, they are also responsible for devastating environmental damage and the resultant displacement of millions of people. The Aswan Dam, while elim-

➤ ARAL SEA

The Soviet Union holds the dubious honor of having built the most ill-conceived and environmentally disastrous agricultural plan in the postwar era. In the 1950s the Soviets decided to exploit the Aral Sea, which sits between Kazakhstan and Uzbekistan, as a water source that would irrigate a huge expanse of previously unused land, primarily for cotton and rice. By 1990, what was once the world's fourth-largest lake was reduced to a third of its original size, and what remained was three times more saline. Half the mammal species were gone, as were 34 fish species.

The agricultural bounty of Central Asia never materialized. As the Aral Sea shrank, it exposed to the sun broad areas of salt- and chemical-encrusted soil that were picked up by the wind and settled on and destroyed much of the same land that irrigation waters were supposed to reclaim. The regional fishing industry lay in ruins, and the drinking water was no longer potable. In 1990, an outbreak of plague afflicted what remained of the population. To make matters worse, less water in the sea meant less moisture in the atmosphere, which translated into regionally drier weather that further devalued farmland.

Solutions are costly. With aid from the World Bank, in 2001 the Kazakh government began an \$85 million effort to reconstruct canals, dams, and waterworks to return water to the portion of the Aral that lies within Kazakhstan's borders. As of 2006, the results were promising: with water, fish, and wildlife returning as well as a fishing industry. However, the Aral seabed that lies within the more impoverished Uzbekistan, which lacks Kazakhstan's oil resources, remained a wasteland.

—Andrew Duffin

inating sporadic and destructive annual flooding along the banks of the Nile, has also prevented the replenishment of adjacent agricultural regions with silt, with catastrophic consequences for agriculture. Many previously thriving agricultural regions have been lost to the desert as a result of the lack of replenishment that silt provided. This has severely affected Egyptian agricultural output in the past quarter century and has displaced droves of Egyptians engaged in agriculture by prompting them to migrate into

Egyptian cities, already fraught by problems due to massive urbanization. The Three Gorges Dam construction has also contributed to the massive relocation of millions of Chinese citizens (currently estimated at 2.3 million) as well as the loss of historical and archaeological sites. Pollutants, unable to diffuse themselves through the course of the river, have accumulated in the reservoir and contributed to low quality of the Upper Yangtze water. Like the Aswan Dam, the buildup of salts in the soil from irrigation has lessened the fertility of regions surrounding the course of the river, which had depended on annual flooding and silt.

Salinization of Water Supplies and Land

Salinization is the increase in salt levels as runoff from rain or irrigation carries salts from soils up to the surface or into groundwater. This can lead to a harmful buildup of salt in soil or water naturally, but most salinization is caused by mismanagement of farmland. Millions of acres around the world have been rendered unsuitable for agriculture, yields have been reduced over a much larger area, and many productive aquatic ecosystems have been damaged or destroyed.

► RECLAMATION BY REPLANTING

Trees may ultimately prove to be a vital element in managing groundwater for farming operations and to prevent salinization in arid environments. China and Australia have been most active in using this traditional solution in their modern salinity management programs. Large reclamation projects with trees have been completed in both countries. In Shangdong Province, for example, more than 4 million trees and 2.5 million shrubs were planted on 13,000 hectares (approximately 32,000 acres) for groundwater management in the battle against salinization.

Trees increase evapotranspiration of water and help maintain groundwater below the danger zone within which salts leach to the surface. Trees also improve microclimatic conditions on surrounding lands, reducing crop water demand and evaporation from the soil surface so that less irrigation water is needed. This climatic improvement results from increased humidity, reduced wind speed, and shading. Trees can also reduce wind damage to crops if planting is planned to provide wind breaks.

Salt-tolerant multipurpose trees can provide farmers with fuelwood, building materials, food, and medicine. These added products can increase

Graphic illustrating soil salinity problems in western Australia. Soil salinity buildup from salt in irrigation water is common, but dryland salinity is a special concern in Australia. Shaded regions on this map indicate areas at risk in one area of southern Australia. Salt can rise from the deeper soil even on such nonirrigated land. Some farmers call it the "white death." Dryland salinity currently affects more than 5 million hectares (12.4 million acres) of land in Australia, and causes damage totaling \$270 million each year. (After Schofield, N.J. "Tree planting for dryland salinity control in Australia" in *Agroforestry Systems*, Nov. 1, 1992)

farm profits and reduce risks, a critical factor in most arid lands.

—David A. Bainbridge

Salinization most commonly occurs when farmland is irrigated in arid environments. This tragic result was first noted in Mesopotamia more than 4,000 years ago. As salt built up in the soil, wheat could no longer be grown, and farmers switched to barley. As salinization became worse, many areas were abandoned and have remained unproductive ever since. Irrigation can also cause the water table to move closer to the surface, and then capillary action can lead to rapid salt buildup in the upper soil. The same problem has occurred when trees are cut in arid environments. As evapotranspiration—that is, the water used by plants—declines, the groundwater rises, and salinization develops.

Research over the last 100 years has demonstrated that if farmlands are managed carefully, salt buildup can be slowed by flushing the soil with water through buried drainage tiles or surface flooding. Unfortunately, this very saline drainage water then creates worse problems when it is concentrated in reservoirs or evaporation ponds. This led, for example, to the toxic selenium buildup at the Kesterson Reservoir in the San Joaquin Valley of California in the 1980s, causing extensive damage to birds and other wildlife. Salinity levels in the inland Salton Sea in southern California have increased to the point where the water has become fatal to most fish species, and the risk to waterfowl is growing each year. The current estimate of the cost to stabilize the Salton Sea ecosystem is more than \$7 billion, highlighting the magnitude of the challenge involved in fighting salinization.

Research also has demonstrated that salinized soil can be reclaimed, but the process requires large amounts of fresh water, costly infrastructure, or a long recovery period. In some cases salt-tolerant trees and shrubs have been used to increase evapotranspiration and drop the groundwater below the danger zone, but this can be costly. Rainfall catchments have also been used to flush salts from planting spots.

Salinization is an ongoing crisis of agriculture and development in arid lands. The technical issues are well understood, but solutions are elusive because it is primarily an economic problem, and little work has been done to convert to more sustainable systems in arid lands. Although the very sophisticated Nabatean floodwater farms

of the Negev Desert in Israel offer excellent examples of what might be done, international aid and development programs instead have promoted large dams, water transfers, and irrigation that inevitably lead to salinization.

Ocean Pollution since 1945

International marine pollution has only been regulated since World War II. In 1948, the International Marine Consultancy Organization—later named the International Maritime Organization (IMO)—was established to regulate international shipping. Six years later, the London Oil Pollution Convention was convened to start a 20-year process for regulating international ocean pollution. Since that time, several other international

THREATENED CORAL REEFS

Endangered Coral Reefs, 2008

■ Reefs at Risk Globally (Calculated as percentages of total reefs)

Categories:

Destroyed: 90 percent or more of the coral is lost on these reef areas.

Critically Endangered: 50-90 percent loss of corals and likely to join category 1 in 10-20 years.

Threatened: 20-50 percent loss of corals and likely to join category 1 in 20-40 years.

Low Threat or Recovering.

A crucial habitat for many species, coral reefs around the globe are now in crisis. Coral reefs are threatened by several processes including disease, coastal development that can increase sediment disposal, invasive species such as the crown of thorns starfish that eats coral, and destructive fishing practices such as the use of poison or explosives to catch ornamental reef fish. Another primary force in the destruction of reefs is coral bleaching that occurs when water temperatures warm enough to expel the organisms that live in the calcium-carbonate hard shell of the coral. The dead coral then turns white, although it may later

Reefs at Medium or High Risk:

51 percent of Pacific
61 percent of Caribbean
82 percent of Southeast Asian

be reinhabited. Thus, climate change has raised important concerns about the ability of coral to survive in some areas if they are unable to adapt to warmer waters. The likelihood of this adaptation is yet unclear but not very promising.

In 2000, 11 percent of the world's reefs were in the destroyed category, but this category has since nearly doubled to 19 percent. Thirty-five percent of the remaining world's reefs are at risk as of 2008. This number is down from previous years because some recovery occurred after a significant bleaching event in the Pacific in 1998, and management has improved through protected areas and effective management, as in the Great Barrier Reef in Australia.

—Peter Jacques

laws have been developed to limit ocean pollution, although most occurred in the 1970s.

Most marine pollution starts on land because of human activities. More than 70 percent of marine pollution comes from land-based sources, while the direct dumping of pollutants into the ocean and pollution from marine transportation make up another 20 percent of all international ocean pollution.

Chlorinated pesticides such as polychlorinated biphenyls (PCBs), dioxins, and dichlorodiphenyl-trichloroethane (DDT) are of particular concern because these chemicals are persistent, meaning they are very difficult to break down.

For marine mammals such as seals, porpoises, and whales that eat fish contaminated with these pollutants, the toxins become a permanent part of their fatty tissue. Humans who eat these fish (or mammals) also accumulate this poison in their bodies. This poisoning has been linked to cancer, and scientists have now documented that marine mammals all around the world are contaminated with DDT, PCBs, and other toxins.

Another major pollution concern is sewage that ends up in the ocean and directly causes major health problems in humans. One in 20 people entering seawater classified as acceptable under some of the most strict water quality

standards in the United States and the European Union will become ill with even just one swim. Every year 250 million cases of gastroenteritis and upper respiratory disease occur from this kind of direct exposure to sewage. Nations that do not have adequate treatment encounter more severe threats. Furthermore, eating contaminated shellfish can introduce infectious hepatitis and is typically responsible for 2.5 million cases per year resulting in about 25,000 deaths and 25,000 victims of long-term disability.

Eutrophication, the process through which bodies of water absorb excess nutrients, can be yet another source of pollution when there is an oversupply of organic material to a water ecosystem. Most typically, eutrophication is related to the amount of agricultural fertilizer and nitrates used near rivers that empty into the ocean. The ensuing algae blooms can be harmful, especially if the algae is toxic to begin with. An overabundance of algae at the top of the sea layer prevents light and nutrients into the water, while dying algae float to the bottom of the area and release the carbon they stored from photosynthesis. The increased use of agricultural fertilizers corresponds with the number of algae blooms experienced each year. In the early 1970s, just over 90 million tons of agricultural fertilizer was used globally, but by the mid-1990s global use of agricultural fertilizer increased 30 percent to more than 130 million tons a year.

As a dramatic example of eutrophication's adverse effects on ecosystems, in the United States agricultural fertilizer runoff into the Mississippi River has created a dead zone in the Gulf of Mexico. A dead zone is an area that has experienced eutrophication to the extent that the dissolved oxygen that other organisms need to live becomes depleted. The size of the Gulf dead zone varies but is typically around 20,000 square kilometers, while some dead zones around the world have been as large as 70,000 square kilometers. A United Nations report from 2003 noted that dead zones had doubled around the world since the 1990s, and the trend is expected to continue upward as the use of fertilizers increases and as fertilizers drain into bays and outlets.

Finally, oil pollution is a matter of concern. Oil pollution comes from operational or intentional releases, tanker accidents, and in-land oil-

related facilities. Oil pollution levels vary greatly from year to year depending on the occurrence of major tanker spills. In general, oil pollution from ships remains steady or in decline. Intentional oil pollution occurs when ships put ocean water in their oil cargo tanks after the oil has been unloaded at port. Tankers then release this contaminated water back into the ocean after it is no longer needed for stability. However, the tanks still have oil residue in them, and this residue mixes with the water to create a sludge-like pollutant.

—Peter Jacques

Invasive Species, 1945–Present

Species exchange has always followed humanity's ability to overcome the physical boundaries between ecosystems, but the pace of that exchange has increased substantially with developing globalization. During World War II travel increased between regions of the world, creating pathways for invasive species to follow. Following the war, transport links often remained, and new trade flourished. While some species introduction post-1945 have been accidental, as with seeds and animals caught up in machinery or clothing or traveling unnoticed in soil, other introductions have been deliberate as people seek new plants for their gardens, new species of fish or plants for their aquariums, new crops, or new forms of biological control for established pests. As in previous time periods, the results of the arrival of any particular species cannot be predicted, and the threat of ecosystem invasion by exotic species remains.

Increasing global ties since 1945 have increased the ability of all species, not just humans, to travel. Global trade has greatly increased in volume, and more trade means more transportation

➤ BROWN TREE SNAKE OF GUAM

One of the most devastating incidents of species invasion after 1945 has occurred on the small Pacific island of Guam. The use of Guam as a U.S. base during World War II increased its air and sea links with Papua New Guinea and resulted in the arrival of the Brown Tree Snake (*Boiga irregularis*). The snake was not noticed immediately, as it is secretive, nocturnal, and arboreal, but two decades after its arrival, the loss of Guam's birdlife drew attention to its presence.

It may have been only one pregnant female Brown Tree Snake that arrived in 1949, but as a result of that arrival Guam has lost 13 of its 22 bird species, and there are far fewer birds on the island. Native reptiles and bats have also been affected.

At present, shipping through Guam is increasing, and there is the danger that the Brown Tree Snake will reach the Northern Mariana Islands or Hawaii and that the experience of Guam will be repeated.

—Claire Brennan

between different regions and a greater risk of unwanted species exchange. In addition, an increasing speed and ease of travel means that species are more likely to survive transportation, and the increase in air travel means that a trip across the Atlantic can be accomplished in hours rather than weeks. Changes in transport have increased the risk of new invasive species in another way too. Invasive species used to be most common near ports, but now transport networks penetrate continents far more thoroughly. The development of containerized transport, whereby goods are loaded into shipping containers and transported to their final destinations rather than unloaded and redispached at a port, means that invasive species can emerge anywhere, not just at international ports.

It is not just landmasses that are at increasing risk of invasive species. The period after 1945 also has seen an increase in aquatic invasive species. Ships have always had the potential to transport stowaway species attached to their hulls or in their ballast, but since 1945 shipping

has vastly increased in volume and speed. In addition, the trade in live seafood, which requires speed, has also allowed species to spread beyond their native range. Likewise, through carelessness or intentional releases, hobbyist fish tank owners have allowed exotic species of fish, plants, and invertebrates to enter waterways, providing even more chances for species to invade new regions. In North America the aquarium trade has introduced the Lionfish (*Pterois volitans*) along the southeastern coast, while the waters around Florida have been invaded by the Moorish idol (*Zanclus cornutus*), the sailfin tang (*Zebrasoma desjardinii*), the yellow tang (*Zebrasoma flavescens*), the bursa triggerfish (*Rhinecanthus verrucosus*), the racoon butterflyfish (*Chaetodon lunula*), the orbiculate batfish (*Platax orbicularis*), and the emperor angelfish (*Pomacanthus imperator*).

Species have been introduced to new regions deliberately as well as accidentally in this period. For example, despite a government decision not to introduce the rabbit disease *Calicivirus* to New Zealand in 1997 (to combat the growing population of this introduced species), farmers deliberately imported rabbit tissue, some infected with the virus, from Australia in a desperate attempt to control New Zealand's rabbit population. In Australia the bumblebee has become extensively established on the island state of Tasmania in the period since 1992. While the bee may have arrived in Tasmania accidentally, there has been support for introducing it to the continent more broadly despite the risks that this might pose.

Although the wholesale redistribution of species around the world has resulted in the presence of more species in any one place, its overall result has been the loss of diversity. Species that developed in isolation, particularly those that developed on islands, have been lost because of habitat destruction, direct predation by humans or other species, or competition for food supplies with introduced species. As a result, many places have more species present, but fewer native species survive as hardier nonnatives or weeds invade disturbed environments. The planet as a whole has become, and continues to become, more uniform and weedy.

Endangered Species, 1945 to Present

Many scientists believe that a massive extinction of species is under way because of the huge growth in human population, the rapid consumption of the world's resources, and the destruction or degradation of habitats, especially species-rich lowlands, tropical forests, wetlands, and aquatic ecosystems. Other people believe that the rate of extinction is less rapid, and some contend that the rate of documented species extinction peaked in the 1930s.

It is clear that some of the world's most magnificent animals are critically endangered. To take one example, only about 6,000 tigers live in the wild today, compared with an estimated 100,000 in 1900. Three of the world's eight tiger subspecies are already extinct. Tigers are killed by trophy hunters and by those who sell their body parts as alternative medicines. Ultimately the loss of habitat is the most important factor. In China, about 1,600 giant pandas survive in isolated forest fragments. Although some 50 panda preserves have been created, the fate of this animal remains uncertain. Only a few rhinoceroses can survive today outside of protected areas because they are hunted for their horns, which are coveted in some societies as traditional medicines, aphrodisiacs, and dagger handles.

Plants and animals with narrow habitats are particularly vulnerable to changes in climate or habitat. The introduction of invasive species, often by accident, has also contributed to species decline and extinction. Genetic erosion—the loss of genetic diversity—can make surviving clusters

Protected reserves have helped increase the population of the endangered black rhinoceros. (Corel)

of plant and animal species vulnerable to extinction from new diseases.

Marine life is also threatened globally. Six of the world's seven marine turtle species are highly endangered. Coral reefs store extraordinary levels of diversity. Some scientists believe that 70 percent of the world's coral reefs may be destroyed by 2050. Many freshwater and saltwater shellfish have declined or disappeared, mainly because of deteriorating water quality. Overfishing has reduced both freshwater and ocean fishes. Perhaps 20 percent of the world's freshwater fish have become extinct or are currently endangered. Some reports suggest that this percentage may be higher.

Tropical invertebrates account for a high percentage of the species that are disappearing. Thousands of these insect species have not yet even been identified. The protection of all species including insects is a matter of considerable controversy. Some argue that species are interlinked in ways that are not fully understood so that destruction of any species could pose a serious loss to humans and to nature in the future. Crucial to the debate is the issue of the social value of the different species, that is, how to determine whether they are worth saving.

Increased public awareness is helping to save some species. The southern white rhino population increased from about 248 in 1997 to 11,600 in 2001 thanks to sanctuary protection in southern and East Africa. The critically endangered

▶ IVORY-BILLED WOODPECKERS

Ivory-billed woodpeckers (*Campephilus principalis*) were the largest North American woodpeckers, measuring from 18–20 inches (46–51 centimeters) in height. Prior to 2004, ivory-bills were last sighted in the woods of northwestern Florida and in the Singer Tract in central Louisiana. The latter was logged in the mid-1940s, whereas the last sighting was in 1944. Until recently the species was believed extinct. Common to old-growth hardwood forests in the southern United States in the 1700s, the ivory-bill was endangered by the logging of the nineteenth and early twentieth centuries. The ivory-bill's food supply is the beetle larvae found in very old dying or dead sweet gums, tupelos, and hackberry trees. The birds nest in an unlined hole drilled into a big cypress tree where a clutch of three to five glossy white eggs would be laid. Prompted by amateur sightings, in 2004 ornithologists from the Cornell Laboratory of Ornithology and the Nature Conservancy of Arkansas led an excursion and reported sighting an ivory-bill in the swampy forests along the White and Cache rivers in eastern Arkansas. Since the 2004 announcement, experts have debated whether the sound recordings and video footage that the Cornell team obtained is of the ivory-bill or a closely related species. Restoration of the ivory-bill would reverse one species' purported extinction.

—Jack Waskey

black rhinoceros is also increasing slowly in protected areas. Many organizations now protect habitat and educate the public about the importance of protecting biodiversity.

The Center for Plant Conservation, for example, works to conserve and restore native plants in the United States, where an estimated 20 percent of native plant species are in decline. The Nature Conservancy, a private conservation organization, has set a goal of protecting at least 10 percent of each of the world's major habitats by 2015. Conservation easements—formal restric-

tions on the use of land designed to prevent the degradation of critical habitats—are one means of protecting biodiversity. Conservation banking, a system under which land developers can buy and sell conservation credits generated by restoring or preserving habitat, also may become increasingly popular.

Government initiatives are critical as well. More than 120 governments have signed the Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES), which offers varying levels of protection for 30,000 plant and animal species. The Endangered Species Act (ESA), passed by the U.S. Congress in 1973, has enabled the remarkable recovery of such species as the American alligator, the Canada goose, the brown pelican, and America's national symbol, the bald eagle. According to the American Bird Conservancy, 44 percent of the bird species protected by this act have increased in number, while about 20 percent have continued to decline and 2 percent have become extinct. In 1992 authorization of the ESA expired. While many of its provisions remain in force, special interests continue to try to weaken or destroy the act.

Why should disappearing birds, beetles, and plants be of concern? As environmentalist John C. Ryan has argued, "A species is the unique and irreplaceable product of millions of years of evolution, a thing of value for scientific study, for its beauty, and for itself. For many people, however, a more compelling reason to conserve biological diversity is likely to be pure self-interest: Like every species, ours is intimately dependent on others for its well-being."

■ Introduction: Environmentalism in Thought and Practice

In 1977, lawyer Christopher D. Stone published his essay “Should Trees Have Standing?” that argued that trees should be regarded as having legal rights. Such a legal argument, which would have been unheard of 50 years earlier, indicates that by the late twentieth century, environmentalism had entered the mainstream of thought and awareness. While it drew from much earlier precedents, including writers and thinkers of the eighteenth and nineteenth centuries, environmentalism has grown and splintered since its emergence in full force in the 1960s and 1970s. The movement gradually moved from wilderness preservation to concerns with all environments. One landmark was the forceful argument of environmental racism, which revealed that environmental ills tended to be distributed where they would harm the health of poor people and racial minorities and not disturb elites. Another more recent landmark is the emergence of environmental stewardship notions in the Christian evangelical community, which suggests a strengthening unity behind the ethic that crosses political lines. The capitalist business model is also beginning to adapt to environmentalist currents when cost-effective. Yet a united purpose is far from guaranteed. Industrial economies, the expansionism inherent in capitalism, and the comforts of consumer lifestyles place continued stress on limited resources. Likewise, inequalities of wealth within nations and between the states of the North and the South indicate that there are forces at work that will continue to divide the unity of purpose needed to achieve the ideals of environmentalists.

—Fred Nadis

Environmentalism and Green Movements

From its symbolic birth at the first Earth Day, held in the United States in April 1970, environmentalism has been a cluster of local, regional, and international movements. Key organizations have incorporated establishment, grassroots, and counterculture philosophies. Older well-funded elite wilderness preservation societies, such as

the Sierra Club (United States) and the Fauna and Flora Preservation Society (United Kingdom) helped shape the environmentalist message that emerged in the 1970s along with new environmental legislation in the United States, Europe, and other countries. Issues such as pollution from industrial sites, smog, chemical dumps, and the protection of wetlands, forests, or other habitats galvanized grassroots organizations, including single-issue groups, as well as public interest groups that developed into important environmental monitoring organizations, relying on litigation against corporations. By the 1990s, inner-city and developing-world groups demanded that attention shift from wilderness protection to also consider environmental justice. In this sense, environmentalism was redefined as a form of human rights. Today, thousands of environmental nongovernmental organizations (NGOs) exist worldwide, while international agreements such as the Kyoto Protocol attempt to broker the problem of global warming. No longer simply a protest movement, environmental monitoring, planning, and sustainable technologies are industries unto themselves, central to governance, corporate strategies, and research and development.

In the 1970s, the more conservative lobbying-based approach to wilderness preservation was represented in the United States by the Group of Ten. This group included the older and more conservative wilderness and wildlife protection groups such as the National Wildlife Federation, the Izaak Walton League, the National Audubon Society, the Sierra Club, the Wilderness Society, and the Council for Environmental Quality as well as newer professional-based groups such as the National Resources Defense Council, the Environmental Defense Fund, the Environmental Policy Center, and Friends of the Earth (a more activist offshoot of the Sierra Club) that focused on policy and court challenges. These groups had ties to important grant sources such as the Ford Foundation as well as funds from an increasing membership base. Many of their leaders had also worked in industry as chief executive officers.

➤ EARTH DAY

U.S. senator Gaylord Nelson of Wisconsin first conceived of Earth Day after visiting the ocean front that the Santa Barbara oil spill had devastated in 1969. While flying to San Francisco, he thought, “My God, why not a national teach-in on the environment.” At a time of civil crisis over the continuation of the Vietnam War, environmentalism created a safe subject for public discussion. The first Earth Day, with teach-ins and speeches planned across the United States, was set for April 22, 1970. One of its chief organizers was the law student Denis Hayes, who said that Earth Day offered an antidote to the public fear that “things were falling apart.”

The day’s more radical events tended toward humor as a tactic. In San Francisco, for example, the Environmental Vigilantes poured oil into a reflecting pool in front of Standard Oil Company headquarters to protest oil spills. In New York City, demonstrators demanding a cleanup of the Hudson River held up dead fish and shouted, “You’re next, people!” Meanwhile, schoolchildren and high school students participated in cleanups and planted trees, while public rallies encouraged a heightened environmental awareness. Earth Day is now celebrated in nearly 200 countries across the globe. Russia, a recent addition to that list, hosted its first Earth Day in 2006.

—Fred Nadis

At the same time, a more radical brand of environmentalism emerged from the 1960s counterculture, suspicious of the status quo and aiming for a thorough refashioning of a green social order. In 1971, David McTaggart formed Greenpeace in Vancouver, Canada. Greenpeace sought dramatic media-friendly David versus Goliath confrontations in which its small boats attempted to force an end to nuclear tests, whaling, and the killing of seal pups. The group soon developed into an international operation with members in the United States, France, the Netherlands, and Canada. In 1985, French agents of the Direction Generale de la Securite Exterieur (DGSE) blew up the organization’s vessel, the *Rainbow Warrior*, while it was docked in New Zealand, killing one crew member. Crew members had been

set to sail to Muroroa Atoll to protest a planned French nuclear weapons test.

Another counterculture group, Earth First!, developed as a radical offshoot of the conservative Wilderness Society in the 1970s. Inspired by Edward Abbey’s 1976 novel *The Monkey-Wrench Gang*, the Earth First! founders, which included Dave Foreman, championed monkey wrenching or direct actions to sabotage development and projects that despoiled wilderness. Earth First! members became best known for their attempts to save old growth forests by chaining themselves to trees, tree sitting, and dramatic protests, while some members resorted to illegal tactics such as hammering steel spikes into trees slated for harvesting. Although such trees were usually marked to prevent harvesting, loggers could be

seriously injured if their chainsaws broke on these spikes.

In the 1970s and 1980s, political movements such as the Green Party and Barry Commoner's Citizen's Party in the United States emerged in an attempt to reform industrial society through electoral politics. Biologist, environmental activist, and socialist, Commoner attempted to forge a new political party that would wed an environmentalist ethic to Old Left bastions such as trade unions. Commoner's 1979 presidential bid faded when Jimmy Carter, the incumbent Democrat, gained the support of mainstream environmental groups. Commoner ended with a modest 250,000 votes. In West Germany in the 1980s, a wide coalition of conservative and radical environmentalists inaugurated the German Green Party. The German group's most important victory came in 1983, when Greens gained parliamentary representation in West Germany. In the same decade, the Verts gained representation in France. In the decades that followed, the German Green Party's idealistic grassroots vision of democracy and oppositional politics gave way to a more realistic approach to implementing goals such as sustainability.

While established environmental groups such as the Switzerland-based World Wildlife Fund, the Netherlands-based Friends of the Earth International, and Greenpeace International have aided environmental projects throughout the world, notable movements have emerged in the developing nations as well. In 1977, Wangari Maatha began the Green Belt Movement in Kenya. Over the decades the tree planting she encouraged spread to 30 African countries and as of 2002 involved the planting of 20 million trees. In her speeches, Maatha, who gained the Nobel Peace Prize in 2004, has underlined the connection between degraded environments, poverty, and political turmoil.

Since the 1980s, the movement to save the tropical Amazon and rain forests of South America—crucial carbon sinks and refuges of biodiversity—has received much international attention and engendered violent conflict. In 1988, Brazilian activist Chico Mendes was murdered. Mendes was a founder of Brazil's National Council of Rubber Tappers, which, along with indigenous groups, protested the destruction of

the Amazonian forest to make way for cattle ranching. Ademir Alfeu Federicci (or "Dema"), leader of the Movement for the Development of the Transamazon and Xingu Region, which attempted to block illegal logging operations as well as dams on the Xingu River, was assassinated in Brazil in 2001.

In Ecuador, groups such as Accion Ecologica and Oilwatch International also formed to slow deforestation and to block oil pipeline construction, often facing violent opposition from government forces. In 1999, Amnesty International and the Sierra Club created Defending Those Who Give the Earth a Voice to attempt to aid Latin American environmental activists, facing violent repression at the hand of government troops aiding multinational enterprises. In other Latin American countries, professionally based environmental groups such as the Bolivian Ecology Society and Costa Rica's Amigos de la Naturaleza have been more successful in their decades-long efforts at establishing national parks and monitoring wilderness. In those countries, public action groups akin to those in the United States have also developed.

In recent years, the United Nations (UN) has become a crucial forum for launching international environmental efforts, forging policy, and providing a forum for issues of environmental justice and environmental monitoring. The UN Conference on the Human Environment (Stockholm, 1972) and the UN Conference on Environment and Development (or Earth Summit) in Rio de Janeiro in 1992 were both landmark events, prompting long-term planning to slow global warming and aid biodiversity and sustainability.

Currently, more NGOs than ever are dedicated to environmental causes, while multinational corporations publicly embrace sustainability. Yet despite some optimistic green business goals, underlying economic structures (quite simply, the profit motive) do not tend to favor sustainability or environmental justice. Environmental awareness has become mainstream, but environmental crisis remains.

Philosophy of Nature

During the second half of the twentieth century, a growing sense of environmental crisis led philosophers and social critics in many countries to reexamine dominant views of the relationship between human beings and the natural world. The new philosophies that emerged during this period were diverse in character and provided the intellectual justification for a wide range of political activism while fueling debates within

the environmental movement over tactics and objectives. In the final decades of the century, philosophers developed increasingly sophisticated analyses of the connections between social and environmental problems and often adopted a global perspective on ecological destruction.

At the outset of World War II, most Europeans and North Americans believed that nature should serve the interests of human society. Deeply embedded in the Judeo-Christian tradition, this view regarded the natural world as a stockpile of resources for human consumption and underpinned a pervasive ethic of environmental exploitation. In the nineteenth-century United States, agricultural expansion, industrial mining, timber operations, and large-scale ranching caused widespread damage to the natural world. These developments, in turn, gave rise to an influential conservation movement focused on regulating economic expansion and protecting

► FIERCE GREEN FIRE

Ecologist Aldo Leopold was born in Burlington, Iowa, in 1887. He developed an early infatuation with outdoor life that would later grow into a lifelong passion. Leopold received a master's degree in forestry in 1909 from the Yale University School of Forestry. He worked for the U.S. Forest Service for 19 years. In addition to working as an independent contractor, he was appointed professor of game management in 1933 at the University of Wisconsin. Leopold died in 1948, and his book *A Sand County Almanac*, published posthumously, is considered a classic text in environmental thought.

In one of the book's most famous chapters, "Thinking Like a Mountain," Leopold described a turning point in his life when he was one of a group of hunters that killed a mother wolf:

"We reached the old wolf in time to watch a fierce green fire dying in her eyes. I realized then, and have known ever since, that there was something new to me in those eyes—something known only to her and to the mountain. I was young then, and full of trigger-itch; I thought that because fewer wolves meant more deer, that no wolves would mean hunters' paradise. But after seeing the green fire die, I sensed that neither the wolf nor the mountain agreed with such a view."

The influential writings of environmentalist Aldo Leopold changed the way many Americans viewed nature. (Library of Congress)

wilderness areas in the American West. Yet by the 1930s most North Americans continued to regard human beings as superior to other living things and to view nature primarily in utilitarian terms.

Aldo Leopold, professor of game management at the University of Wisconsin-Madison, objected strenuously to this dominant view. His best-known work, *A Sand County Almanac* (1949), promoted a new ethical orientation toward nature. The adoption of his land ethic involved recognizing that humankind was part of a larger biotic community of animals, plants, soils, and water and that all living things have an inherent right to exist. For Leopold, these values were the building blocks of an ecological conscience based on an individual obligation to protect what he called the health of the land. In keeping with this ethic of responsibility, he was often critical of government conservation efforts, arguing that conventional legislative and technological solutions to the problem of environmental degradation slighted the need for fundamental changes in human attitudes.

The philosophy of deep ecology, first articulated by Norwegian Arne Naess in 1972, drew on the key principles of the Leopold land ethic to criticize mainstream environmentalism and advocate a fundamental transformation in human consciousness. For Naess, the largest and most powerful environmental organizations were focused too narrowly on the problems of resource depletion and pollution in advanced industrial societies and tended to neglect the profound shift in human values required to address the escalating environmental crisis. Subsequent deep ecologists were inspired by Eastern religions and alternative strains in Western thought to stress the interconnectedness and equality of all living things and the need for new cultural norms. American proponents Bill Devall and George Sessions argued that the solution to pressing environmental problems required personal spiritual growth, global population controls, and the adoption of a land ethic. In the late 1970s, the radical environmental group Earth First! became the most visible adherent of deep ecological principles, using them as an intellectual foundation for its confrontational brand of political activism.

Deep ecologists often faced criticism from rival environmental thinkers. The most vocal criticisms came from social ecologists and ecofeminists, two groups that rose to prominence in the 1980s. Led by anarchist philosopher Murray Bookchin, social ecologists assailed deep ecology for its limited understanding of the causes of environmental degradation and its narrow focus on wilderness preservation and population control. To Bookchin, the root of the ecological crisis lay not in misguided human values but rather in the hierarchical and authoritarian nature of human social, economic, and political structures. These structures permitted some humans to dominate other humans and nature and therefore had to be dissolved. Accordingly, Bookchin advocated the development of new forms of political organization, economic production, and technology that were consistent with the specific features of local ecosystems. These small-scale community-based institutions were envisioned by social ecologists as uniquely suited to the goals of modest consumption, collective governance, and ecological sustainability.

While many ecofeminists embraced the principles of deep ecology, others criticized it for failing to address gender issues. First labeled in 1974 by the French philosopher Francoise d'Eaubonne, ecofeminist thought drew on diverse ideas from ecology and feminism but was united by a belief in the essential connections between the oppression of nature and the oppression of women. Many of d'Eaubonne's followers argued that understanding these connections was crucial for understanding why humans have abused the environment. Meanwhile, other ecofeminists insisted that women experience nature in fundamentally different ways than men and can offer unique advice on building healthy environmental relationships. In the mid-1970s, ecofeminism was animated primarily by cultural feminists who celebrated the feminine qualities of nature and viewed ancient traditions of goddess worship as a source of political empowerment. Liberal feminists concerned with the passage of environmental legislation were also instrumental in launching the movement. More recently, however, Marxist intellectuals have expanded the body of ecofeminist theory into entirely new terrain by examining the complex links between

capitalism, gender oppression, racial and ethnic prejudice, and environmental degradation. The development of such integrated analyses of social and environmental problems characterized the evolution of environmental thought in general during the second half of the twentieth century.

Rachel Carson's *Silent Spring*

In 1962, Rachel Carson (1907–1964) published a series of articles and then the book *Silent Spring*, which passionately argued the dangers to humans and nature posed by pesticides such as dichloro-diphenyl-trichloroethane (DDT). In an age when big business and technological solu-

tions went unquestioned, her best-selling book sounded an alarm. Carson's premise was simple: pesticides, although designed to kill insects and so prevent blights and diseases, were collecting in the environment and poisoning all of us. As she wrote, "Every human being is now subjected to contact with dangerous chemicals, from the moment of conception until death." Most historians agree that the publication of *Silent Spring* was a milestone in the modern environmental movement.

Born in Springdale, Pennsylvania, Carson earned degrees in 1929 at the Pennsylvania College for Women and in 1932 from Johns Hopkins University. She then worked at the Marine Biological Laboratory at Woods Hole, Massachusetts. In 1936 she joined the U.S. Bureau of Fisheries at its station in Patuxent, Maryland. She wrote radio scripts and pamphlets for the Bureau and also began writing books for a popular audience about the ocean and its ecology, including *Under the Sea-Wind: A Naturalist's Picture of Ocean Life* (1941); *The Sea around Us* (1951); and *The Edge of the Sea* (1955).

In *Silent Spring*, Carson shifted from natural history to an indictment of then-current insect abatement practices. She offered a well-documented argument to prove her point that insecticides, which spread throughout the ecosystem and collected in the food chain, concentrating in tissues, were a threat to human life and nature. She also captured her readers' imaginations with her lyricism and skillful presentation. Her book opened with a description of an imaginary small town in America, harmoniously balanced with nature, suddenly experiencing blight. Suddenly, no birds sang, chickens began to lay eggs that would not hatch, cattle died, and adults and children succumbed to illnesses. Carson, who was dying from breast cancer when she wrote the book, insisted that citizens deserved the right to know the dangers they had been subjected to. Chapters included titles such as "Elixirs of Death," "Needless Havoc," "And No Birds Sing," "Rivers of Death," "The Human Price," and "The Other Road."

Silent Spring quickly became a controversial best-seller. While Carson questioned the ethics of scientists whose research catered to industry's needs, opposition from government officials and

Rachel Carson appears before a Senate Government Operations subcommittee to discuss pesticides in 1963. (Library of Congress)

scientists was muted as her book also argued for further research of the ecological implications of insecticide use. The chemical industry and agribusiness, however, hired a public relations firm and gathered together a \$250,000 war chest to challenge Carson's viewpoint via public lectures, television and radio appearances, pamphlets, articles, and direct mail campaigns. Her scientific credentials were questioned, her use of evidence was belittled as name dropping, and her argument was presented as hysterical and that of a fanatic follower of a cult of nature. Chemical manufacturer Monsanto created a parody of *Silent Spring* titled *The Desolate Year*, which argued that without pesticides blights on agriculture and cattle, and human diseases such as malaria would run rampant. Another industry pamphlet sent out in mass mailings titled *Fact and Fancy* counterposed Carson's "Allegations" with "Facts."

Carson's book is still regarded as a key text in the environmental movement. It stimulated public debate, further research, and an eventual ban on DDT while advancing the position that government and industry should be held accountable for public health endangerment.

Animal Rights

Animal rights galvanized as a social movement in the 1970s as one of the radical adjuncts of the new environmentalism. Based on the philosophical premise that sentient animals have a moral status, animal rights activists left behind the gentler reform tradition of the centuries-old animal welfare movement to urge a new ethic. Long-standing animal welfare societies such as the

➤ RACHEL CARSON'S "A FABLE FOR TOMORROW"

"Some evil spell had settled on the community: mysterious maladies swept the flocks of chickens; the cattle and sheep sickened and died. . . . In the town the doctors had become more and more puzzled by new kinds of sickness appearing among their patients. . . . There was a strange stillness. The birds, for example—where had they gone? . . . The farmers complained that they were unable to raise any pigs—the litters were small and the young survived only a few days. The apple trees were coming into bloom but no bees droned among the blossoms, so there was no pollination and there would be no fruit. . . .

"This town does not actually exist, but it might easily have a thousand counterparts in America or elsewhere in the world. I know of no community that has experienced all the misfortunes I describe. Yet every one of these disasters has actually happened somewhere."

Source

From the Introduction to Rachel Carson's *Silent Spring* (1962; reprint, Boston: Houghton Mifflin, 2002), 2–3.

American Humane Association had primarily urged a more humane treatment of animals, whether in experiments, captivity, or slaughterhouses. The new activists, however, argued for the abolition of much of the scientific testing of animals, the slaughter and eating of animals, the trapping and raising of animals for fur or hides, and the exploitation of animals for entertainment, as in circuses and zoos.

The animal rights movement was strongly influenced by the publication of two books, Australian philosopher Peter Singer's *Animal Liberation: A New Ethics for Our Treatment of Animals* (1975) and Tom Regan's *The Case for Animal Rights* (1983). Both of these philosophers critiqued the assumption, inherent in Western philosophy and religion, that animals are subordinate to humanity and of no moral consequence on their own. Singer, a utilitarian, argued that right and wrong actions can be calculated by weighing whether one's decision maximizes benefits or adds to overall suffering. Since it was

➤ PLANTS AS PLAINTIFFS— “SHOULD TREES HAVE STANDING?”

In 1972, law professor Christopher D. Stone published an article titled “Should Trees Have Standing?” in the *Southern California Law Review*. He argued that it was time to radically rethink humanity’s relationship to nature and to extend legal rights to trees, rivers, lakes, animals, and other natural objects. He argued that historically, legal rights had slowly extended to previously excluded groups such as corporations, minority groups, and children.

Just as courts might appoint legal guardians to the mentally incapable or infants, Stone argued that trees might be appointed guardians to protect their rights. He wrote the article as part of a brief for the U.S. Supreme Court case *Sierra Club v. Morton* (1972) to attempt to stop the development of a valley in Sequoia National Park. While the Sierra Club lost that case, Justice William O. Douglas dissented, in part because of Stone’s argument. Douglas’s dissent supported the notion that individuals could sue on behalf of the environment. Ultimately the development in the valley was stopped on another appeal. While Stone’s argument for legal rights for natural objects did not win the day, it furthered discussion of extending standing to include a more general notion of injury, as seen in a 1973 Supreme Court ruling in the *United States v. Students Challenging Regulatory Agency Procedures* (SCRAP). Stone’s article has remained influential, furthering discussion of ways to merge an environmental ethic with law.

—Fred Nadis

clear that sentient animals suffered (i.e., could feel pain and pleasure), this reality had to be taken account in all ethical decisions. In Singer’s view, all sentient beings are equals in regard to pain.

Regan, in his work, made the case for animals not in terms of utility but rather of rights. That is, they had a claim to justice. Animals had intrinsic value that should be honored. They should not be treated as instruments or simply as means to ends. If humans would not volunteer for laboratory testing, then neither cats nor monkeys should be forced to be test subjects. Both philosophers supported a radical revision

of the treatment of animals: calling for an end to most or all animal testing in laboratories and an end to hunting and the raising of animals as food for humans.

As a social movement, the animal rights movement developed alongside environmentalism as well as new legislation efforts such as the Endangered Species Act of 1973 in the United States and the formation of radical ecogroups such as Greenpeace. Radical animal rights organizations also developed, including the radical Animal Liberation Front (ALF) and in 1980 People for the Ethical Treatment of Animals (PETA). A celebrated case came in the late 1970s when Henry Spira, a labor organizer in New York, began to investigate experiments that the National Institutes of Health (NIH) had sponsored for many years at the Museum of Natural History in New York. The experiments involved maiming cats in different ways to see how they would then cope sexually, for example, how frequently a cat that had been rendered deaf, incapable of smelling, or brain damaged might try to mount other cats. After congressional investigation and public outcries, the NIH, after 17 years of support, withdrew its funding, and the lab was closed.

The more radical ALF, begun in England in the late 1970s, engaged in illegal activities on behalf of animals such as breaking into laboratories to free test animals. According to allegations, ALF has also threatened animal researchers and vandalized laboratories. PETA, while controversial, has tended to avoid outlaw actions. It had its origins in 1980 when activist Alex Pacheco gained a volunteer position at the Institute for Behavioral Research in Maryland in Edward Taub’s laboratory, where macaque monkeys were subjected to painful experiments aimed at understanding why human stroke victims sometimes could not move limbs when there was no clear nerve damage. In a criminal trial, Taub was convicted for violating the state’s anticruelty statute. The conviction was later overruled by the Maryland Court of Appeals, but the laboratory lost its federal funding, and publicity over the case prompted congressional hearings on animal cruelty.

PETA has since organized actions against the use of animals to test cosmetic products and has sought to abolish the fur industry. PETA relies on

Stained with red paint and possessing leghold traps, a demonstrator from People for the Ethical Treatment of Animals (PETA) is arrested outside the entrance to Vogue magazine in New York City on June 2, 2003, while protesting the use of animal fur in the fashion industry. (Adam Rountree/Getty Images)

shock tactics and humor. At one event in Iowa, for example, an activist in a pig costume threw a pie in the face of the Iowa Pork Queen at the World Pork Exposition. In addition to enlisting high-profile rock musicians for its “Rock Against Fur” concerts, fashion models aided PETA’s “I’d Rather Go Naked Than Wear Fur” advertising campaign that also included street activists parading naked in the United States, Italy, Germany, and Japan. On July 5, 2007, PETA continued its annual “Running of the Nudes” in Pamplona, Spain, to protest bullfighting as a sport.

Despite its ethical concerns, PETA and the animal rights movement, with its celebrity backers and protests of populist venues such as circuses, project an elitist image. In 2005, a PETA

campaign asking “Are Animals the New Slaves?” drew criticism in New Haven, Connecticut, for its images of ankle shackles on an elephant next to an image of shackles on a black human. The Southern Poverty Law Center’s Intelligence Project director, Mark Potok, remarked, “Black people in America have had quite enough of being compared to animals without PETA joining in.” This controversy came only months after another misbegotten PETA campaign, “Holocaust on Your Plate,” in which animals were compared to Nazi Holocaust victims.

Environmentalism in Literature and the Arts

Following World War II, many activists issued warnings about the dangers of radioactive fallout from atomic testing, smog inversions in cities such as London and Los Angeles, and the widespread use of chemical pesticides. It was not until the 1970s that such environmental concerns became leading issues worldwide. Following the first Earth Day, held in the United States in 1970, environmentalism not only became prominent in public forums and in legal and political debates but also became a shaping force in the media, arts, and literature as artists and writers embraced the environmental cause.

The Santa Barbara Oil Spill of 1969 prompted public outrage and numerous photo essays in magazines that depicted landscapes blighted by industrial pollution. Wilderness preservation clubs had earlier explored similar photo exposés. The Sierra Club, for example, published numerous calendars, posters, and books that

➤ DR. SEUSS'S *THE LORAX*

Children's author Ted Geisel, better known as Dr. Seuss, in 1957. He took up the cause of environmentalism in his 1971 children's book *The Lorax*. (Library of Congress)

The children's book author and illustrator Dr. Seuss (Theodore Geisel, 1904–1991) was at the height of his influence in the 1960s and 1970s. Many children throughout the world enjoyed his books. Yet Seuss wanted an escape from the frenzied lifestyle near his California home, and in the fall of 1970 he vacationed in Africa. While there, he was inspired by the trees, elephants, and other wildlife of the region. *The Lorax*, written during the trip and published in 1971, describes the destruction of a healthy forest resulting from corporate and personal avarice, abdication of responsibility, and ineffective environmental advocacy.

highlighted threatened wilderness and wildlife. In 1963, the Sierra Club published *In Wilderness Is the Preservation of the World*. This large-format or coffee-table book featured quotes from Henry David Thoreau alongside Eliot Porter's photographs of pristine wilderness. In 1965, the Sierra Club published *This Is the American Earth* with Nancy Newhall's text warning of an Earth endangered by urban sprawl. The accompanying landscape photographs, by Ansel Adams and oth-

The tale is told by the Once-ler, who lives at the sludge-gray "end of town." When he had arrived, the area was filled with dancing Bar-ba-loots, "rippulous" ponds, and Truffula trees that smelled like "butterfly milk." He saw a chance to cash in and used the Truffula's silky tufts to create a sweaterlike Thneed. Despite warnings from a foresighted but shrill Lorax, the Once-ler's business eventually ruins the Truffula forest and scatters the animals. In the end, all the Once-ler can do is pass the last Truffula seed to a small boy and urge him (and all of us) to plant and care for the trees.

Readers who had enjoyed Seuss's earlier works were surprised by *The Lorax*'s stark message and uncertain ending. At least one logging community tried to ban the book from school reading lists, and building and manufacturing interests sponsored *The Truax*, a book with an alternative ending. Yet *The Lorax* remains important for demanding environmental action, rather than simple appreciation, from our children. Particularly since the early 1990s, *The Lorax* has headed ecology teachers' and librarians' booklists. It will continue to do so as long as the well-being of Earth hangs in the balance.

ers, contrasted untrammelled nature with hellish images of new suburban tracts in Los Angeles.

While such efforts were aimed at the domestic front, the environmental movement also developed an iconography for public protests and display. The counterculture staple *The Whole Earth Catalog*, first published in 1968, featured on its cover a satellite photograph of the whole Earth with swirling clouds above the oceans of a blue sphere. Also emblazoned on posters and

buttons, the whole Earth satellite photograph, aimed at raising the consciousness of purchasers, has had lasting iconic power. A green-and-white striped ecology flag, first publicized in *Look Magazine* in 1970, still is common at environmental awareness events. Another notable addition to such public iconography was a 1971 Keep America Beautiful television advertising campaign that featured a close-up of the actor “Iron Eyes” Cody—actually Antonio DeCorti of Sicilian ancestry—portraying an American Indian in traditional garb with a tear rolling down his cheek as he surveyed a blighted industrial landscape. The print version ran with the headline “Pollution, It’s a Crying Shame.”

Highbrow art movements also bore the imprint of environmentalism and an engagement with the 1960s counterculture’s back-to-the-earth sensibility. The October 1968 show at the Dwan Gallery in New York City titled “Earth Works” announced this new art movement. Many of the earthworks artists arranged natural materials, whether dirt, stones, gravel, coal, asbestos, grass, sawdust, or tree branches, in galleries or in the countryside. For example, in 1968 Walter De Maria filled an entire gallery with two feet of dark soil. Other artists, particularly Robert Smithson and Michael Heizer, began to create grandiose earthworks projects in the deserts of the West. Smithson’s masterpiece was *Spiral Jetty*, an earthworks piece completed in 1970 that required bulldozers to build a spiral-shaped raised-earth pattern on the shores of the Great Salt Lake in Utah. Westerner Michael Heizer also created large earthworks projects in the deserts of Nevada. In contrast, Richard Long, an English earthworks artist, distanced himself from such large-scale engineered landforms that he felt were “about ownership, real estate, machinery, American attitudes.”

Environmentalism also became part of the protest music repertoire. Joni Mitchell’s witty song “Big Yellow Taxi,” for example, lamented a lost Hawaii strangled by commercial development. Soul singer Marvin Gaye entered the arena with his lament “Mercy, Mercy Me (The Ecology)” (1971), which became a blues for the planet, as he described winds containing poisons, fish containing mercury, and other environmental woes. In contrast, folk pop songwriter John Denver’s

song “Rocky Mountain High” (1973) became an anthem for wilderness lovers. From the late 1960s, jazz saxophonist Paul Winter, as a form of homage to Earth, began directly quoting nature in his music. His compositions increasingly relied on recorded animals such as the songs of humpback whales and wolf calls. Winter’s 1987 album *Whales Alive*, for example, included the composition “Concerto for Whale and Organ.”

Nature writing as a genre gained new life after the publication of Rachel Carson’s *Silent Spring* (1962), which warned of the dangers of the use of insecticides such as dichloro-diphenyl-trichloroethane (DDT) to humans, animals, and entire ecosystems. Naturalists turned journalists such as Canadian Farley Mowat took up the cause of wildlife in such books as *Never Cry Wolf* (1963), while naturalist Edward Abbey described the hidden beauty and values of the desert landscape in his memoir *Desert Solitaire* (1968). Abbey also became notorious after the publication of *The Monkey Wrench Gang* (1975), a novel about a group of activists who destroy billboards and construction equipment and otherwise stymie new developments that would mar the natural beauty of the American West. Abbey’s books inspired David Foreman to found the radical environmental group Earth First! in 1975.

While poets have always written of personalized encounters with the wilderness and the wild, Gary Snyder might be dubbed the unofficial poet laureate of environmentalism. A founding member of the beat generation literary movement, native of the American West, and student of Zen Buddhism, Snyder has consistently written of humanity’s debt to the planet. His work mixes nature mysticism with an earthy sense of humor. His poems include, for example, one widely circulated on the Internet, the comic paean “Smokey the Bear Sutra.” It depicts Smokey, the U.S. Forest Service mascot, as a benevolent yet fierce guardian of Earth, ready to feed those who are hungry, uproot false desires with his shovel, and stamp out the endangerments to nature created by human greed.

Science fiction has long been ideal for dramatizing environmental issues, with its creators imagining worst-case scenarios or environmental apocalypses. Cold War science fiction writers wrote numerous books that conjured post-nuclear

holocaust worlds and landscapes. Beginning in the 1960s, with almost equal frequency, science fiction authors such as Philip K. Dick, Ursula K. LeGuin, and J. G. Ballard imagined post-environmental apocalypse worlds featuring new ice ages, floods from rising seas, or landscapes of blighted species. Science fiction movies such as *Silent Running* (1971) also offered a postapocalyptic vision. Its plot centered on the efforts of a botanist tending the last existing Earth forests now afloat in space ships.

Concerns about global warming that became prominent in the 1990s have also led to apocalyptic scenarios exploited in novels and films. For example, Roland Emmerich's film *The Day after Tomorrow* (2004) explored the premise that global warming could trigger a sudden and devastating ice age. True to the religious theme of apocalypse, this film ended with the vision of a postcrisis moral revival, as the cataclysm encouraged a new global unity.

International Environmental Law and Agencies

Until the late 1960s, most international agreements aimed at protecting the environment served narrowly defined utilitarian purposes and were not specifically identified as environmental agreements. Indeed, what is now recognized as environmental law began to be identified as such only as recently as the late 1960s. Since then, the tremendous growth in both the number and breadth of environmental treaties, conventions, and other international agreements has paralleled the growth of national legislation, regulations, and environmental agencies around the world that collectively have sought to preserve, protect, and enhance the environment.

Like many of the branches of international and environmental law, international environmental law is interdisciplinary and still evolving. Internationally, environmental law has developed in response to a number of worldwide trends that have become global in scope and impact only since the mid-1900s, especially the following: unsustainable use of nonrenewable resources, climate change from increasing greenhouse gas emissions, stratospheric ozone depletion, increasing acidification of rain, freshwater bodies and oceans, the reduction in and degradation of natural areas (with a corresponding loss of biodiversity and human cultural diversity), increasing use and misuse of chemicals, escalating energy use, unplanned urbanization, increasing waste generation, disruption of biogeochemical cycles, and unsustainable human population growth. As of 2008, around the world environmental treaties, laws, and regulations cover the following subject areas: air, atmosphere, conservation (of nature, natural areas, and natural resources), environmental impact assessments, fishing, forests (conservation and management), hazardous substances and radiation, hunting (harvestable species), land use and land-use planning, noise, nonrenewable resources use and mining, protected areas, the sea, soil, wastes (for example, garbage and rubbish), water, and wild animals and plants (including species protection and management, control of pests and diseases, and vegetation cover).

In addition to multilateral conventions, treaties, and other international agreements, statements, reports, and documents issued by multinational and nongovernmental organizations also have relevance in shaping and defining international environmental law. Another source is customary international law, which is often evidenced by national legislation, government statements, restatements of the law, and the interpretations of international tribunals such as the International Court of Justice, the World Trade Organization, and other arbitral bodies. Secondary sources include treatises, periodicals, and increasingly Web sites. One problem concerning the limits of international environmental law results from the very important role played in the field by the European Union as a

► ENVIRONMENTAL TREATIES

Until the late 1960s, most international agreements aimed at protecting the environment served narrowly defined utilitarian purposes. Beginning with the Stockholm Declaration of the United Nations Conference on the Human Environment in 1972, however, international agreements started to reflect a desire to limit damage to the global environment. In general, these international agreements paralleled national legislation that increasingly sought to preserve, protect, and enhance the environment.

—Bertram C. Frey

Bertram C. Frey is Deputy Regional Counsel for the U.S. Environmental Protection Agency, Region 5, Chicago, Illinois. Any views expressed in this article are those of the author and not necessarily those of the U.S. EPA.

quasi-federal institution. The environmental rules issued by the European Union can be considered intermediary between international and national law. But neither domain can ignore them.

Beginning with the 1972 Stockholm Declaration of the United Nations Conference on the Human Environment, governments pursued efforts to protect the environment with a global perspective. The United Nations Environment Programme (UNEP), the first international environmental program, was formed as a result of the conference. Since the Stockholm Declaration, the pace of progress in recognizing and addressing global environmental problems has quickened. Alarming, this progress has coincided with the continuing decline and in some regions decimation of the ecological systems that nurture and sustain all life on Earth.

The 1992 Rio Declaration on Environment and Development (sustainable development) and 2002 Johannesburg Declaration on Sustainable Development bear particular mention because they represent the 20- and 30-year follow-ups, respectively, to the Stockholm Declaration. The Rio Declaration introduced key principles that promote sustainable development and stated that global economic progress requires global environmental protection, which in turn requires international and equitable partnership and agreement. The Johannesburg Declaration, which addressed a wider variety of topics than the Rio and Stockholm declarations, promotes global sustainable development not only through environmental protection but also through poverty eradication and improved consumption and production patterns.

Since the founding of UNEP, international entities have established several international agencies to protect the environment. For example, the World Meteorological Organization and UNEP, both UN organizations, established the Intergovernmental Panel on Climate Change (IPCC) in 1988 to evaluate and understand the risks and impacts of human activity-induced climate change as well as assess possible solutions for adaptation and mitigation. Established in 1990 at the World Congress of Local Governments for a Sustainable Future, the International Council for Local Environmental Initiatives (ICLEI), an association of more than 700 local, national, and

regional government organizations, promotes sustainable development. Additionally, regional entities such as the Commission for Environmental Cooperation (created by treaty, effective in 1994, by Canada, Mexico, and the United States) and the European Environmental Agency (European Union agency created in 1990 that became operational in 1994) help monitor the environment and identify environmental conditions and trends.

International environmental law reflects growing scientific understanding of the complex term “environment.” As current research on the environment confirms that developing countries continue to be the most vulnerable to environmental damage such as (among others) habitat loss resulting from global climate change, loss of biodiversity, depletion of fish stocks, and increasingly severe natural disasters, international concern has incrementally expanded to recognize the interrelationships that exist among and between not only air, land, water, and all living things but also global poverty, economy, and society. As scientific understanding of these interrelationships increases, international agreements and agencies will adopt new and refine existing environmental standards. Thus, international environmental agreements always await their inevitable revision.

—Bertram C. Frey

Sustainable Development

In 1987, Gro Harlem Brundtland, chair of the World Commission on Environment and Development, introduced the concept of sustainability in the book *Our Common Future*, prepared for the United Nations. This groundbreaking book defined sustainability as "development that meets the needs of the present generation without compromising the ability of future generations to meet their own needs." In addition to stressing the value and importance of natural resources and the natural services that a functioning ecosystem provides, this book highlighted the importance of addressing the problem of poverty to protect the environment and to improve the quality of life.

The term "sustainability" is a new name for old practices. Sustainable development reflects the practices of many traditional societies, including the Iroquois Confederation of the Eastern United States. Their decision making was guided by a concern for the Seventh Generation, not simply the people living today. This forward-looking approach is needed to bring ecological, cultural, and economic considerations into development decisions, but it is not easy because these changes affect who profits and who pays and often run counter to corporations' responsibility toward investors and the desire of governments—at all levels—to encourage prosperity in the short term to protect political careers.

Since the term "sustainable development" first emerged on the world scene, it has most commonly been related to environmental issues associated with agriculture, animal production, water, energy, fisheries, forestry, planning, and building. Critics have noted that with rising populations and improved technology we have been mining most potentially renewable resources instead of harvesting them. A 2006 report in *Science* magazine predicted that if current trends continue, almost all important ocean fish species will be effectively gone by 2050. World water resources are equally imperiled and are expected to lead to increasing conflicts. Recent studies

➤ STRAW BALE BUILDINGS

*Straw bale house under construction in Quebec, 2003.
(Colin Rose)*

Buildings are responsible for 40 percent of the global-warming gases produced in the United States, but we can dramatically reduce energy use and improve comfort and security if we design and choose building materials wisely. Orientation, shape, insulation, thermal mass, ventilation, and shade all work together for natural heating and cooling.

Straw bales with mud or lime plasters are becoming increasingly popular as sustainable materials for building homes and commercial buildings. Straw, the waste material left after grains such as wheat are harvested, is usually baled with a machine towed behind a tractor. Straw bales can be used structurally or for insulation in a wood or metal frame building. After the walls are completed, they are plastered with lime, mud, or cement plaster. The techniques are simple, and communities and families often work together to create their own homes.

This building technology originated on the treeless plains of Nebraska but has now spread all over the world from Mexico to China. In Mongolia straw bale buildings have reduced energy use for heating by 80 percent.

—David A. Bainbridge

suggest that as many as 50 countries on 5 continents might soon be caught up in water disputes unless they learn to better manage and apportion scarce resources. Timber mining around the world also remains a critical problem, with an area of forest comparable to the size of Panama lost each year.

The popularity of the term “sustainable development” has diluted its meaning in recent years. By using a narrow enough focus it is possible to say that almost anything is sustainable: for example, “sustainable profits (for this year)” or “sustainable water use (for Las Vegas at the cost of San Diego and Tijuana).” This has led some advocates to contrast the notion of a strong sustainability, with a holistic ecological/cultural and economic content, to a weak sustainability.

An interest in the research and implementation of sustainable policies bodes well for the future. We ignore such issues at our peril. The concept of an ecological footprint has been developed, for example, to help people understand the impact that each individual has on Earth’s natural support systems. Web-based ecofootprint calculators indicate that supporting Earth’s entire human population according to the prosperous Western standard would require at least 3 and perhaps as many as 10 additional planets.

Fortunately, this footprint can be decreased without lowering living standards. For many of the products we use, 90 percent of the biomass harvested and the abiotic (nonrenewable) resources relied on are wasted. From this perspective, humankind has few supply problems but has very serious efficiency problems. Efforts to reduce inputs 4, 10, or 20 times are under way in the effort to achieve sustainable development.

The integration of sustainable development into the marketplace and economy has been increasing rapidly. The value of understanding environmental sustainability has also been gaining strength, and the importance of social/cultural sustainability is gaining long-overdue attention. The challenge for this century is improving efficiency and sustainability globally. As sustainable practices become good business practices, the marketplace will play a key role in making this happen.

Alternative Energy—Water, Wind, Solar, and Bio

Renewable sources of energy are defined as fuels that are consumed with no net or permanent depletion of Earth’s resources and also make no addition to greenhouse gases. Examples are hydroelectric power, wind power, solar power, biofuels derived from plants or waste, wave power, and wood from fast-growing tree crops. Nuclear power plants usually fall outside the renewables category since they consume enriched uranium or plutonium, generate long-lasting radioactive waste, and involve heavy energy consumption to construct although emitting no carbon when generating electricity.

Hydropower is the most established renewable, with significant potential to meet electricity needs beyond the nearly 20 percent globally it already supplies. The amount of electricity that a hydropower installation can produce depends on the quantity of water passing through a turbine (the volume of water flow) or on the height from which the water falls (the amount of head). Today, the largest water turbines are extraordinarily powerful machines, producing in excess of 700 megawatts (nearly 1 million horsepower).

Norway obtains 95 percent of its electricity from hydro sources. China has also invested large sums in hydroelectric schemes, of which the most spectacular is the giant Three Gorges scheme, due for full completion in 2012. Harnessing tides or ocean waves is among the new possibilities being explored.

Wind is the fastest-growing energy source worldwide. From 1998 to 2005, world wind energy harvesting increased approximately six times. Europe dominates regional markets, followed by North America, then Asia, the Pacific Region, Africa and Latin America, and the Caribbean. There are many different types of wind turbines in use around the world, and they are employed in diverse applications from powering small water pumps on remote ranches to producing bulk electric power for modern cities. The blades on a modern wind turbine sweep 48 tons of air every second, which is the same weight as 10 elephants. Large modern wind turbines have rotor diameters ranging up to 65 meters. Towers range from 25 to 80 meters in height. The main drawback of wind power is that it is, by its nature, intermittent and requires backup facilities to meet continuous demand. Estimates of efficiency vary between 14 percent and 36 percent. Large wind farms on land can also be highly intrusive. Even when sited offshore they require heavy cabling and coastline substations. The economics of wind power are such that heavy subsidies are nearly always necessary, usually in the form of levies on other power sources.

Solar power, which in essence is unlimited and highly accessible, can be harnessed in a number of ways and on a large or small scale. Photovoltaic energy conversion (PV) is the direct conversion of light (solar radiation) to electricity and heat. Solar power is also collected in very large volumes through the so-called concentrated solar power technology. This can produce heat at up to 300°C, which is then used to drive steam turbines and generate electricity. On a smaller scale solar power can be, and is, captured via roof panels for direct water heating or via links to a central conversion point to produce small flows of electricity sufficient for domestic lighting. It is conceivable that solar power could yet be the next big thing. The technology

Wind turbines in Estonia, an emerging solution to the energy crisis. (Shutterstock)

has been described by an enthusiastic Chinese manufacturer of large-scale solar equipment as “about where mobile phones were ten years ago.” In other words, a very rapid advance in large-scale solar technology is seen as potentially lowering costs dramatically.

Biomass (plant material and animal waste) was the world’s primary source of energy until the late 1920s. Today about 10 percent of the world’s energy use is still derived from biomass. However, this average masks the far greater importance of bio energy in the developing countries of Africa, Asia, and Latin America, where its share is as high as 80 percent. Bio fuels—natural gas from animal waste, biodiesel from soybeans, and ethanol from corn, grain, sugarcane, farm waste, and straw—are sustainable. They also have the potential to create jobs and economic growth in developing countries, reduce demand for costly oil imports, and address environmental problems ranging from desertification to climate change. The production of energy from biomass involves a range of advanced technologies to produce a variety of liquid and gas fuels including ethanol, bio-cellulosic ethanol, and bio-diesel fuels. The infrastructure throughout North America necessary for inserting biomass firmly into the fuel supply chain is fast taking shape. Six U.S. states already require all gas station pumps to have 10 percent biofuel content. But car and truck makers would need to build vehicles with

➤ ETHANOL IN BRAZIL

Brazil, the world's biggest sugar producer, is devoting most of its sugarcane crop to ethanol. Ethanol represented only a small share of Brazil's fuel market until the government made reducing oil import dependence a national priority after the 1973 Arab oil embargo. As a result of a combination of tax breaks and fuel blending mandates that encouraged investment in ethanol production and use, the industry made rapid progress. Sugar mills won large subsidies, and a national distribution system was built around existing gas stations to give motorists a choice at the pump. At first, ethanol was blended with gasoline. Next, it was sold as an alternative to gasoline. The Brazilian government also promoted the manufacture and sale of all-ethanol cars. Brazilian automakers were told that half of their new vehicles had to be ethanol-only cars, while infrastructure was developed to distribute ethanol to thousands of pumping stations around the country.

As a result, by the mid-1980s ethanol-fueled vehicles accounted for 96 percent of total car sales. But growth slowed dramatically in the 1980s and 1990s as oil prices fell and sugar prices rose, so that by 1997 sales of ethanol vehicles fell to less than 1 percent of total vehicle sales. To address this problem, in 2003 Brazil began encouraging flexible fuel vehicles that can run on virtually any mixture of gasoline and ethanol, changing the ethanol market overnight. In 2005, flex-fuel vehicles accounted for more than half of new cars sold. Today, the nine vehicle makers in Brazil (including General Motors Corporation and Ford Motor Company) make flex fuel cars that can burn gasoline, ethanol, or any mixture of the two. Brazil has rebuilt its economy on ethanol and other bio-fuels, using sugarcane as its main energy source. Since the 1970s, Brazil has saved almost \$50 billion in imported oil costs while creating more than 1 million rural jobs.

—Carole Nakhle

slightly adapted engines, as has already happened in Brazil (see sidebar). The cost of adding this capability to new automobiles has been estimated at roughly \$100 a vehicle. And ethanol would need to be much more readily available at gas stations.

Biofuels are expected to make a significant contribution to meeting global road-transport energy needs. They can account for 7 percent of the road-fuel consumption in 2030, up from 1 percent today. Biofuels undoubtedly have a place in the emerging global energy mix. But rising food demand, which competes with bio-fuels for existing arable and pasture land, will constrain the potential for biofuels production using current technology.

Kyoto Protocol

In 1992, at the United Nations (UN) Earth Summit in Rio de Janeiro, the Framework Convention on Climate Change (UNFCCC) was adopted. The framework reported the growing danger of human-induced global warming and the need for a shared international policy to curtail greenhouse gas emissions. Carbon dioxide is the most prominent of the gases that contribute to the greenhouse effect. In subsequent meetings of the UNFCCC Conference of the Parties (COP 1) in 1995 and 1996, standards for reducing emissions were adopted as a part of international law. In 1997, at the third COP meeting, more than 160 UNFCCC member nations met in Kyoto and adopted the Kyoto Protocol. With the adoption of the protocol, UNFCCC signatory nations that went on to ratify would then be committed to its emission-reduction regimen from 2008 to 2012. The protocol required 38 industrialized nations to reduce or cap their greenhouse gas emissions to levels of 5 percent their total for 1990. As of 1997, this meant that European nations would reduce their then-current levels by 8 percent,

Japan by 6 percent, and the United States by 7 percent.

For the Kyoto agreement to go into force it had to be ratified by at least 55 UNFCCC nations and, in addition, by a group of industrialized nations whose combined emissions totaled 55 percent of that groups' output. Both of these conditions were met when Russia ratified the agreement in November 2004. At that point the only major industrialized nations that had not ratified were Australia and the United States. The United States (the world's leader in producing greenhouse emissions), under the incoming administration of President George W. Bush, announced in 2001 that it would not ratify because the Kyoto Protocol did not require industrializing nations that were also major polluters, specifically China and India, to cap levels as well. Australia, a major coal exporter, hedged but finally signed in December 2007 under the leadership of newly elected Prime Minister Kevin Rudd in time for the new UNFCCC meetings in Bali to plan for 2012 and beyond. As of early 2008, the United States remained the only industrialized nation that had not ratified the Kyoto Protocol.

While there were no legal enforcement mechanisms—beyond UN-based review procedures—the Kyoto Protocol, a multiparty treaty, became international law when Russia ratified in 2004. In addition to direct efforts to reduce total emissions of air pollutants from industrial sources, automobiles, and deforestation, at a conference in Marrakesh, Morocco, in 2001 the UNFCCC also finalized several market mechanisms, allowing developed nations to pursue less costly measures that would still decrease overall global greenhouse gas emissions. The most intriguing of these is emissions trading in which developed nations can purchase emission-reduction efforts in other developed nations. To this end, regional markets have developed to encourage so-called dirty businesses to buy credits from others that have cleaned, with the net effect that emission-reduction efforts will be financed. In an aligned mechanism known as joint implementation, developed nations can help finance carbon sinks, or reforestation or afforestation (creating new tree groves), in other developed nations to the credit of their own reduction goals. Finally, developed nations can finance projects in less-developed

Participants at the United Nations Climate Change Conference in Bali, Indonesia, in December 2007. (Oxfam International)

nations that lead to emissions reductions, including reforestation efforts.

In December 2007, the UNFCCC met again in Bali to begin a framework for a new agreement to begin in 2012 when the Kyoto Protocol would have concluded. The meeting ended with a road map including provisions that developing nations (including India and China) would also begin to voluntarily reduce emissions, in a verifiable process, and that in turn developed nations would lend expertise and help to finance cleaner technologies in the countries of the South (or less-developed nations). After being booed and hissed earlier, the U.S. representative announced that the United States would not stand in the way of the road map.

Plans were also put into place for wealthier nations to finance efforts to prevent deforestation—which releases large levels of carbon dioxide and eliminates effective carbon sinks—in undeveloped nations with tropical forests. Many environmentalists were concerned that the new plan did not put into place specific reduction regimens, for example, the 25–40 percent reductions by 2020 that the UN Intergovernmental Panel on Climate Change (IPCC) had recommended for the developed nations. However, other experts saw the conference as a breakthrough in North-South relations, with both the United States and emerging industrial giants such as India and China offering concessions.

—Fred Nadis

➤ CARBON MARKETS

In 2005, the European Union opened trading for carbon credits via its Emissions Trading Scheme (ETS). According to this scheme, European governments issue allowances to industry and utilities with a baseline to reduce overall greenhouse gas emissions. Companies that use less than their allowances can sell their surplus to others that fail to meet their allowances (that is, pollute too much). The European Union also allows these permits to be traded one on one with Certified Emission Reduction credits, earned from funding carbon cuts in less-developed nations. The ETS also recognizes futures trading market in carbon allowances. As of 2007, the scheme was flailing since too many allowances originally had been issued, forcing the allowance values down to almost a hundredth of their original cost, making polluting a fairly inexpensive exercise. Likewise, the baseline permits had been handed out to industry for free, allowing companies to sell them as a windfall profit.

Although not bound by international law to the Kyoto Accord, a regional carbon credits market, the Regional Greenhouse Gas Initiative (RGGI) has been established in the United States. Ten Eastern Seaboard states created RGGI to reduce greenhouse gas emissions in the region by 10 percent

over a nine-year period. RGGI (or “Reggie”) is due to go into effect in January 2009 and continue to 2018. Rather than offering permits free of cost, states will auction them and thus allow market forces to set values.

In yet another carbon market scheme, the U.S. Congress in late 2007 began to debate the America’s Climate Security Act (ACSA). Like the regional ETS and RGGI, the ACSA proponents would set up a national emissions market with pollution caps and trading for surplus. Other members of Congress have argued for an emissions border tax whereby imported goods would have their carbon content certified and taxed to ensure that U.S. carbon initiatives would not decrease U.S. competitiveness globally. Others suspect that this would only lead to new tariff disputes.

New Zealand has set itself the daunting goal of one day becoming carbon neutral, that is, emitting no more greenhouse gases than it can absorb. With its 4 million people, 40 million sheep, and 10 million cows, approximately 30 percent of New Zealand’s greenhouse gas emissions come from the natural gas of methane emitted by livestock. Carbon dioxide, methane, and nitrous oxide are the most common greenhouse gases.

Industrial Ecology

The emerging field of industrial ecology attempts to redesign and rethink industrial systems so that they more closely mimic natural ecosystems. This concept first emerged in the late 1980s, was refined in the 1990s, and has since evolved rapidly around the world. Proponents argue that industrial ecologies will eventually be

fully recycling, with closed resource loops and no wastes, and will run entirely on renewable energy. These new manufacturing systems will be designed to fit into the landscape without harming the environment or human health. They will use sustainable or fully recyclable resources, and products will be used, reused, recycled, or returned to nature at the end of service.

The rapid growth of global connectivity has made this goal more approachable. The field also benefits from new accounting methods that calculate the true cost of products and processes. By including the environmental and health costs for both the short and long terms when evaluating profit or loss, company managers, stakeholders, and consumers gain information they need to make more profitable and sustainable choices.

Industrial ecology also is becoming easier as the analysis of material flow improves. Analysts

must calculate these flows at the company, regional, national, and global levels. Material flow accounting helps reduce leakage and losses and connect waste generators with waste users. The International Society for Industrial Ecology and the International Society for Ecological Economics provide the intellectual foundations for this important work, but a new generation of ecological accountants and engineers will be needed.

To create more ecological industrial systems, industrial ecologists need to calculate the life cycle costs of products, from the cradle to the grave (made, used, disposed) or the cradle to the cradle (made, used, recycled, reused, or returned to nature). This is the goal of most sustainability reporting, including the Eco-Management and Audit Scheme in Europe and the internationally based Global Reporting Initiative. This will not be easy, because flow pathways and impacts can be complicated and occur over many years or decades.

Industrial ecology has worked well in the chemical industry, which might seem the most resistant to change. At the Rhone-Poulenc plant in Chalampe, France, for example, the nylon-manufacturing process was changed to eliminate a problem with diacids, which previously had been burned. New equipment recovered these in a more useful form so they could be sold as additives for dye and coagulation, with a three-year payback. More commonly, return on such adjustments is even better, with nearly two-thirds of improvements in one chemical industry study having a payback of less than six months. Apple Computer recycles or reuses 97.5 percent of the material at one plant, saving \$1 million the first year. The Sony Corporation has cut waste dramatically and has set a goal of no disposal to landfills by 2010.

Industrial ecologists argue that we can provide the same level of production, comfort, and quality of life with sustainable resources and renewable energy. The continuing increases in gross national product with energy use per capita declines in a range of nations reveals the promise of this trend, but much remains to be done. The long-term goal of industrial ecology is to create an economy that is as efficient, healthy, and pleasant to be in and around as a natural ecosystem. Early efforts suggest that this is both

➤ KALUNDBORG

A key task of industrial ecology is finding consumers for waste because Waste = Food. This is easiest in industrial parks where waste generators and consumers are colocated, reducing costs for exchanging materials. The town of Kalundborg, Denmark, is an early example of this approach. The company Statoil removes sulfur from its natural gas to reduce air pollution, selling the sulfur to the nearby Kemira sulfuric acid plant. The Asnaes power plant sells gypsum wastes to the Gyproc plasterboard factory. The fly ash from the power plant goes to a cement manufacturing plant. The hot water from the power plant provides district heating for the municipality and to Novo Group, a biotech company. The leftover boiler water and salty cooling water from the power plant provides 23 million cubic meters of warm water to a fish farm, increasing fish production 15 percent with a two-year payback for improvements. Water consumption at the power plant was cut 66 percent, and high-quality feed water was replaced with waste water. Thermal pollution of the ecosystem and surrounding waters has been reduced dramatically, and many other products are sold including soil amendments offered by Soilrem A/S. There are 20 different product exchanges within this industrial symbiosis.

—David A. Bainbridge

possible and profitable, but critics argue that it is too little too late and too difficult a change for the existing industrial base. It remains to be seen if industrial ecology can provide a way forward out of a currently unsustainable economy that threatens the world with global warming and pervasive pollution.

Electric, Hybrid, and Fuel Cell Automobiles

Electric vehicles, considered a serious development option in the late nineteenth and early twentieth centuries, is making a comeback in the early twenty-first century along with hydrogen fuel cell vehicles. Curiously, not even the resurgence of gas-electric hybrid automobiles is a novel idea. During the heyday of the electric vehicle, early-twentieth-century magazines reported that the future was bright for the petrol-electric car.

At the start of the twenty-first century, the petroleum and automobile industries retained their

close working relationship and wielded their lobbying might. Yet times appear to be changing as consumers and legislators demand greater engine efficiency without the attendant noise and pollution. Consequently, gas-electric hybrid vehicles have gained appeal in the marketplace, and the potential of the all-electric hydrogen-powered fuel cell car is gaining interest.

The weight of the batteries and relatively long recharging times have muted the long-term market success of all-electric vehicles. One battery-only-powered electric car, General Motor's EV-1, marketed briefly in the late 1990s, is unlikely to serve as prototype unless a major breakthrough in battery technology is achieved. In the meantime, hybrids using electric motors augmented with small clean-burning gasoline engines are gaining market acceptance, particularly since hybrid cars do not sacrifice the ability for long-distance travel.

After only five years of sales in the United States, hybrids in 2006 had already obtained a 2 percent share of the automobile market. Toyota, the leader in sales of gas-electric hybrids, sold 312,500 units in 2006, of which 240,000 units were sold outside the United States. The 33 percent rise in sales over 2005 was a result of increasing consumer favor for fuel-efficient vehicles resulting from surging gasoline prices. Analysts have predicted an overall gas-electric hybrid growth at 20 percent annually, with almost 8 million vehicles expected to be in operation by 2020. The next step in the evolution of the gas-electric hybrid is the plug-in hybrid electric vehicle (PHEV) that will run on either an electric motor or a small gasoline engine. The emergence of lithium-ion batteries, able to store twice the power of current nickel-metal-hydrate batteries used in today's hybrids, will define the marketing of the PHEV.

The acceptance of hybrid technology is also paving the way for the fully electric vehicle, one that uses fuel cell technology instead of batteries to power the generators while entirely eliminating the gasoline engine. The hydrogen fuel cell is not a fuel or a motor but rather a device that generates electricity. It emits zero emissions, producing only heat and water. The electricity produced will run a generator or series of motors within the next generation of electric vehicles.

➤ EARLY ELECTRIC VEHICLES

Electric vehicles appeared on the roads of New York City in 1896 as an alternative to horse-driven cabs. In the following year, the United Kingdom's W. H. Preece began electric taxicab service in London. His plan created competition for the hackney carriages that had served the city since the seventeenth century. These electric taxicabs found favor around the world since they left no polluting waste and were much less noisy and were easier to start than their gasoline counterparts. By 1904, New York City, Boston, and Chicago saw electric vehicles comprising one-third of the market, competing with both steam-powered and gas-powered automobiles. Acceptance of electric vehicles was rapid, with more than 34,000 on the city streets by 1912. Almost 50 companies manufactured electric cars, catering to a wide range of consumer budgets and tastes. However, the advent of cheap gasoline and a desire to travel great distances ended this early era of popularity for electric propulsion.

—Robert Karl Koslowsky

Continuing development is leading to fuel cells as reusable resources.

However, just as with the introduction of gas-electric hybrid vehicles, the initial selling prices for hydrogen-powered electric vehicles will be higher than conventional alternatives. A second challenge remains: the infrastructure modifications needed to deliver hydrogen fuel at the filling station, a challenge that the manufacturers of gas-electric vehicles did not have to face. While hybrid vehicles still use gasoline, hydrogen fuel-cell vehicles abandon gas completely in favor of another fuel source, elemental hydrogen packaged in a compressed pressurized form.

Even a century ago, a poll taken at the inaugural National Automobile Show held in November 1900 revealed that attendees favored electric vehicles over gasoline vehicles by a wide margin. Today hybrids are gaining market share because they utilize existing infrastructure, something not available 100 years ago, and reduce air pollution. At the end of the twentieth century, the American Lung Association estimated a \$93 billion annual cost for health care due to automobile pollution.

—Robert Karl Koslowsky

Energy Efficiency

Since the 1970s, environmental advocates have been pushing for energy efficiency (whether involving building techniques, materials, power generation and distribution, or infrastructure planning) as a cost-cutting measure but more importantly as a step toward achieving sustainability. Interest in energy efficiency increased, first with the escalating costs of oil in the early 1970s and more recently with the growing confirmation of human induced global warming. As an example of increasing interest in this area, the U.S. Department of Energy (DOE) spent a total of \$6.3 billion on research and development on energy efficiency during 1973–1995. The

stimulus plan that President Barack Obama signed in February 2009 earmarked nearly \$20 billion toward energy efficiency and renewable energy spending, including research and the retrofitting of government-owned buildings and the homes of lower-income people. The United Nations World Summit on Sustainable Development in 2002 led to the founding in 2004 of the Renewable Energy and Energy Efficiency Partnership (REEEP), a nongovernmental organization funded by many European nations as well as the United States, Canada, and Australia that encourages sustainable energy practices including energy efficiency in both developed and developing countries around the globe.

The main scientific concern behind energy efficiency is simple: when one form of energy is converted to another, there is always some energy lost to the environment. So, energy efficiency is all about minimizing that loss. A simple measure of improved energy efficiency is when the same end can be achieved with less initial energy input, as it demonstrates clearly that less energy is being lost in the process. In buildings, the primary efficiency concern involves the supply and conservation of thermal energy for heating (or cooling) air, water, and food. Another energy efficiency concern is the consumption of electricity, which is typically used as the energy source for other requirements. Given that sources of thermal and electrical energy all waste energy to some extent no matter what measures are taken to improve efficiency, it has become incumbent on architects, builders, material manufacturers, and the owners of buildings to take responsibility for optimizing the energy efficiency of houses, apartments, offices, shops, factories, and so on.

In the case of buildings, particular emphasis has been placed on building design and construction materials along with methods of maximizing insulation and ways of harvesting energy (especially solar, wind, or water power) on site. The overall idea is to create buildings that require less energy input with the use of solar panels, heat exchangers, and other options. Solutions include low-tech approaches, such as the building of straw bale houses that efficiently insulate, or systems for farmers in the developing world to harvest natural gas from animal waste for cooking

and heating. High-tech approaches include the use of electronic components such as smart windows and panels that electro-chemically block or allow sunlight through depending on thermal needs. Other medium-tech measures such as the shift from incandescent lightbulbs to more efficient compact fluorescent lightbulbs (cfl) have been championed worldwide. Likewise, solar heating can involve low-tech passive heating systems in which roof ponds, rocks, masonry walls, or other materials soak up heat that is then distributed in various ways, as opposed to more costly photo-voltaic solar power conversion panels.

Another important phenomenon in the energy efficiency movement is the recycling of materials. Reprocessing waste metals, glass, and plastics uses far less energy than manufacturing them from raw materials. In addition, there has

been a good deal of research put into harvesting the waste thermal energy from power stations and putting it to good use growing foodstuffs. This improves the energy efficiency of the power stations and conserves energy in the fuel that might otherwise be used to ship the same foodstuffs from other countries. In the same way, the emphasis on farmers markets and buy-local movements in the West can cut down on fuel costs from shipping foods hundreds of miles or more.

—Gerard Cheshire

■ Introduction: Feeding the World—Agriculture, Livestock, and Fishing

The population of the world has more than doubled since 1945. Means employed to feed this burgeoning population have included agricultural expansion into previously wilderness areas, increases in water supplies, the Green Revolution in agriculture, the development of industrial farming, and advances in biological research.

Agricultural development into former wilderness areas has occurred in many places around the world, including tropical regions where rain forests have been destroyed to make way for farming and ranching. The loss of jungle habitat in the Amazon basin has been matched by the encroachment of farmers upon forest lands or wild areas in India, Southeast Asia, and elsewhere. The habitat losses have alarmed environmentalists.

Dams built as hydroelectric projects and as sources of agricultural water have raised the capacity of many areas for agricultural production, but such dams have also destroyed valuable historic and cultural sites as well as some species dependent upon running water.

The processes we refer to as the Green Revolution began after World War II when manufacturing efforts were redirected from munitions to producing chemical fertilizers. The new fertilizers made agriculture possible in areas that had been infertile or at best marginal lands. The increased yield that chemical fertilizers made possible was coupled with advances in the development of high-yield hybrid seeds. The great growth in food supplies fed more people and increased farmer incomes. It also contributed to the movement of people into the cities as mechanization made their labor obsolete.

The Green Revolution also led to a consolidation of agribusiness. As of 2007, three major companies (Syngenta, Bayer, and BASF) controlled close to half of the world's global agriculturally related chemical industry. Industrial farming emerged as an extension of advances in fertilizers and seed in basic commodity row crops such as corn. It also describes the development of meat production of poultry, pigs, and cattle en masse in feedlots or facilities known as confined ani-

mal feeding operations (CAFOs). Animals were no longer allowed to range freely but were warehoused and given feed that contained medicines, growth hormones, and carefully prepared feed mixtures. The increases in food production were enormous, but the effects were also a growing degree of obesity in the West.

Fish pounds for fish farming have a history that dates back to ancient times. Modern fish farming that includes oyster, shrimp, and other seafoods has expanded to an industrial scale. It was also matched by destructive fishing practices that eliminated or so threatened stocks of some fish that somewhat ineffective efforts to halt such overharvesting have been enacted by law and treaty.

The story of food production after 1945 is one of great increases in the food supply. However, many have argued that the global resources are finite and that eventually a Malthusian event will occur. By the term “Malthusian event,” we are referring to postulation of the Reverend Thomas Malthus in *An Essay on the Principle of Population* (1798). Malthus noted that populations grow geometrically (exponentially), while food production grows arithmetically; in other words, any population will increase to the limits of its capacity to find or produce food during times of highest production. When production returns to normal or below, starvation, wars, and general misery occur. According to this theory, since global population grows at more rapid rates than food supplies, starvation is likely to be the end for many people. So far his dismal prediction has not occurred, but there are many who fear that the food gains are not sustainable.

The carrying capacity of the planet for humans is dependent upon the ability of humans to produce more food. Even after the Green Revolution, there are millions who still have inadequate diets due to global environmental degradation, poverty, and the onset of famine. The growing demand for more and better foods in China and other developing economies has added to the challenge.

—Jack Waskey

Agribusiness and Factory Farms

At the end of World War II much of the world was still agricultural and rural, with farms tend-

ing toward the small family model. One important exception was the large collective state-run enterprises set up in the Soviet Union in the 1920s and 1930s that displaced peasant farmers. Much of the United States remained filled with small farms; states such as Hawaii, however, where large corporations such as Dole dominated agriculture, were early harbingers of the future. In Hawaii, sugar and pineapple along with cattle ranches had dominated the agricultural economy for decades. There large-scale farming with plantation-style workers had been the norm as it had been on the larger farms in the U.S. South, with their dependent sharecroppers. Large agriculture also had become the norm early in California, whose ranchers relied on displaced persons and Mexican and Filipino guest workers to labor in what Carey McWilliams described as its “Factories in the Fields” in 1939.

As of the 1940s, mechanical, chemical, biological, and economic factors began the shift to large-scale farming across the world. New varieties of seeds, chemical fertilizers, and automated equipment were introduced. Increased production was significant enough to keep food prices so low that huge agricultural surpluses occurred in the United States and Canada. The surpluses also underpaid small farmers to the point that many were driven off of the land, further consolidating large holdings.

As post-World War II wages increased, the cost of farm labor also increased to the point that mechanization came as a solution to the low rates of return on agricultural commodities. This in turn led to more farm families leaving the land and to the growth of agribusiness in tandem with the widespread use of machinery and improved distribution. The profits in agribusiness for farm machinery companies, seed growers, and chemical companies supplying fertilizers, pesticides, and herbicides grew, as did actual harvests. The economies of scale for farming continued to drive small farmers out and to promote consolidation.

The advent of the Green Revolution with its herbicides and fertilizers in the 1960s and the 1970s contributed to the decline of the agricultural population and consolidation of big holdings in the United States and other parts of the world. By the 1980s agribusiness was international in its operations. Foods were grown and

shipped around the world. From the tropics went tropical fruits that had never been really affordable in temperate zones. From the temperate zones flowed commodities such as wheat, corn, rice, dairy products, and meats that fed the growing subtropical and tropical populations. Animals raised for meat, instead of left to graze, were shifted to feed lots, stimulating feed crops.

The development of genetically modified crops, resistant to disease or insects, was accompanied by faster modes of transportation for delivering foods to global markets. As environmentalists protested the use of pesticides or other chemicals, some agricultural operations simply moved to the developing world and continued production. From 1961 to 2004 the export of chemical pesticides from countries such as the United States and China to developing nations increased threefold to \$3.3 billion. As early as 1990, the World Health Organization noted that around 3 million people a year suffered from severe pesticide poisoning. Three large companies—Bayer, Syngenta, and BASF—as of the early twenty-first century controlled approximately half of the global agrochemical market.

Genetically modified (GM) seeds, first brought to the market in the 1990s, two decades later had become a critical factor in agribusiness: 85 percent of the soybeans and nearly 50 percent of the corn grown in the United States are from GM seeds. Monsanto Corporation sold close to 90 percent of all GM crops in the world. While these seed varieties are developed to help crops withstand disease, pests, and droughts, such a narrowing of crop seed varieties has had a marked effect on biodiversity.

The consolidation of farms and the widespread use of mechanization ended the practice of setting aside a part of a farm for raising food for the draft animals. Large-scale raising of animals has shifted to confined animal feeding operations (CAFOs). New feed mixtures were designed for maximum growth in animals and birds in the least amount of time. Farm animals were increasingly bred to be designer breeds that would produce a uniform quality meat product. Genetic stock has been depleted. Nearly all the white eggs available in the United States, for example, come from one variety, the white leghorn. Over 40 percent of the world's meat supply now

comes from CAFOs. Animals on CAFOs are subjected to regimens that include growth hormones and antibiotics.

Corn is grown in increasingly standardized varieties that have been used not only for traditional agricultural needs but also for industrial purposes. Most of the corn crop was no longer used to feed humans or livestock. From the chemical that could be derived and then transformed from corn, hundreds of products were developed. Huge portions were used to make traditional chemicals such as ethanol as a fuel substitute. Corn syrup has been used as a sweetener in all manner of foods and beverages. It is less expensive than and has often replaced cane sugar. The products made from processed corn include foods such as grits and corn meal as well as corn oil, corn starch, liquid glucose, dextrin, malt dextrin, sorbitol, and dextrose monohydrate. Chemicals derived from corn are also used to make biodegradable plastics. Like corn, other commodities such as soybeans are also being chemically processed into other products.

The linking of agricultural commodities with industrial food production increased food supplies for feeding an increasingly globalized economy. It also was seen as a threat to survival, as the varieties of seeds used were ever more specialized hybrids. Agribusiness also contributed to widespread ecological damage, as land was often kept in production rather than being rotated. Intensive buildup of animal waste and the introduction of growth hormones and antibiotics into the ecosystem and human consumers have also been of concern. Factory farming also has been linked to global warming, with animal gas a considerable source of greenhouse gas. Such operations, in tandem with fast food operations and supermarket chains, are all links in the global agribusiness network and illustrate the downside of the Green Revolution and industrial-scale farming: more people are fed, yet diseases and environmental damages increase along with dangerous working conditions. Advocates of organic foods and green movements have been critical of industrial-produced foods.

Soil and Agricultural Sustainability

Earth's soil is the living skin of the planet, the organic and inorganic layer that allows plants, and thus humans, to survive. Ever since the advent of agriculture some 10,000 years ago the emergence, fruition, and decline of countless civilizations can to a large degree be explained by the maintenance of soil fertility. In recent decades soil resources have been pushed to ever further lengths to support growing demand and to improve balances of trade, conditions that jeopardize long-term sustainability.

Irrigated lands often build up salt levels in the soil's top layers. Once afflicted, soils remain sterile for decades, turning once-thriving farm operations into wastelands. And with the total number of irrigated land worldwide nearly doubling in the last 40 years, today approaching 300 million hectares, it is no surprise that this problem has grown more acute. In addition, the explosion of chemical fertilizer use after 1945 meant that other harmful substances, such as nitrates and selenium, came to irrigated soil's top layer, often leaving land unsuited for farming and the surface water unfit for drinking.

Erosion is another great threat to agricultural sustainability. Although it occurs in nature anywhere there is wind or water, human activity currently accounts for upwards of three-quarters

Terraces are cut and trees planted to stabilize from erosion the valuable loess soil in Shaanxi, China. The land in this region has been cultivated for the past 3,000 years. (Julia Waterlow; Eye Ubiquitous/Corbis)

of all erosion. This is no small matter, for the uppermost layers of topsoil contain all the essential nutrients that make agriculture possible. Remedies are difficult. Fertilizers can make plants grow in the absence of good soil, but to pay for them farmers and governments usually must incur considerable debt. Chemicals do not fix the problem; they merely mask the dark reality that repeated plowing on steep slopes or on unstable land undermines long-term output and profitability.

Perhaps the most dramatic example of the effects of erosion on agriculture is in the loess plateau of China. Loess, or wind-driven soil deposits, are typically quite fertile but also loose, light, and prone to erosion. The land has been in cultivation for roughly the past 3,000 years, but population pressures and the demands of the communist regime have put the land under far greater stress in recent decades, with the result being serious drops in productivity and an increase in rural poverty. One historian claims that from 1957 to 1977 China had 25 million acres of land rendered useless by erosion and that one-seventh of the landmass has been afflicted. But in command economies, as in capitalistic ones, short-term wants usually win out over protecting future interests.

Erosion damages grazing lands as well as croplands. This was true particularly in Africa in the twentieth century, either because colonial powers encouraged or demanded more animals

➤ WHY CALIFORNIA'S CENTRAL VALLEY IS SINKING

Excessive pumping of groundwater in much of California's Central Valley—an intensive agricultural area—has resulted in it sinking approximately 30 feet since the late 1940s. Much of this water was siphoned off by local agricultural interests since early in the century. Geologists call the process that leads to sinking *subsidence*, which is caused by the filling and draining of underground aquifers. The problem lies when year after year these aquifers are drained to increasingly lower levels due to increasing water demand, which causes surrounding rocks and soil to become compacted. This decreases the amount that can be stored the following year and allows for the decreasing elevation of the upper strata of soil. Sinking elevations have also led to the creation of hills where there formerly was flat land. With California's current water crises, due to high demand, agricultural needs, and widespread development, the Central Valley and other parts of the state will continue to sink.

—Abraham O. Mendoza

be allowed to graze or because the unregulated nature of the commons discouraged land stewardship. The data is clear: the number of grazing animals in Africa increased from 295 million in 1950 to 520 million in the early 1980s. In Ethiopia cattle have mowed down native perennial grasses, which were then replaced by annual grasses that provided less ground cover. Erosion then ate away at the land, making cattle grazing an even more tenuous enterprise. And in Swaziland, erosion on steep slopes has created not just gullies but also trenches up to 30 meters deep.

Basic statistics explain why there has been such pressure to develop new agricultural and grazing lands. In 1900, world population stood at 1.6 billion. By 2000, world population surpassed 6 billion. In response, from 1940 to 2000 the total area of land farmed worldwide increased by about 158,300 square miles (300 million hectares), and the total area of land grazed increased by more than 5,019,328 square miles (1.3 billion hectares). The challenge to feed the world became enmeshed with the desire to

maximize productivity in both the developed and less-developed nations, usually with significant environmental and social consequences. Yields from farming and ranching on submarginal land can be strong for a few years, allowing for population growth and high profits in the short-term, but cannot produce well for long. Deforestation, erosion, and salinization have all been a consequence of the pressures to develop such marginal lands.

Soils can also be damaged by activities seemingly far removed from the agricultural realm. Industrial pollutants, whether falling from the air or carried in by water, can quickly turn rich farmland into useless dirt. Such was the case in nations eager to industrialize. Industrialization in postwar Japan came at the expense of heavy metal particulates that drifted onto rice fields and infiltrated groundwater. The Eastern Bloc states developed smokestack industries that did much the same, putting lead, zinc, cadmium, and other metals into the environment. Moreover, most of these elements persist for hundreds or even thousands of years.

Understanding geological forces and deep history is essential for appreciating the value of fertile soil. On average, it takes about 10,000 years of sediment deposition and plant growth and decay to form a mere 30 centimeters of soil. At such a pace, it is easy to see the significance of soil conservation.

The Green Revolution

The Green Revolution was a major transformation in agriculture that began in the 1940s and became dynamic and celebrated in the news media by its champions in the 1970s. The term “Green Revolution” was first used by William Caud, a U.S. Agency for International Development (USAID) officer. He described the huge gains in productivity reaped by farmers from using improved varieties of seeds in conjunction with improved agricultural techniques and chemical fertilizers as a Green Revolution.

The 1970s was a time of significant ideological competition between the United States and the Soviet Union, expressed in one arena in terms of opposing modernization strategies directed toward the postcolonial developing world. An important target of these strategies was the great masses of agricultural people in the developing nations of Asia, Africa, and Latin America. The Communists sought a Red Revolution of social change characterized by command economies. In contrast, the emphasis by Western capitalists was on increasing wealth by increasing agricultural productivity dependent on private investment strategies through the World Bank and the International Monetary Fund. The Green Revolution became the focus of Western aid strategies.

The roots of the Green Revolution had developed earlier, in the 1940s, in Mexico, where famine was averted through the use of improved seeds and planting techniques. The Rockefeller Foundation and the Ford Foundation had sponsored the experiments that demonstrated that new hybrid strains of seed and modern chemical fertilizers would increase crop yields by manyfold in some cases. In 1961, with famine threatening India, the Indian government at that time, while seeking to be independent or nonaligned with either the communist Eastern Bloc or the capitalist West, yielded to necessity and invited U.S. agronomist Norman Borlaug to India. Experiments were conducted in the Punjab region where the five rivers flow into the Indus River. The wheat yields from the experiment were huge. Rice from hybrid strains grown with chemical fertilizers and modern planting techniques yielded harvests that doubled and tripled the

➤ MECHANIZATION OF AGRICULTURE

In the postwar prosperity following World War II, many economists and government officials in the United States felt that small-scale agriculture had become marginal. Farms and livestock operations needed to be consolidated and needed to incorporate new technology to improve efficiency, production, and profits. The ensuing mechanization of cotton growing and other cash crops ended the need for unskilled labor, and thousands of sharecroppers left farms in the South for California and the big cities of the North. The same movement off of the farms occurred all over the United States.

By the mid-1950s many of the remaining U.S. farmers decided to contract with a large corporation, such as Campbell Soup, Ralston Purina, or Sunkist Growers, to produce a specific quantity of crop, such as tomatoes, grain, or oranges. While this reduced farmers’ financial risk and guaranteed an income, in effect they gave up control to the corporation. This led most agricultural companies to become very vertically integrated, making decisions about every step of production, processing, and commercial marketing.

Similar developments occurred among livestock producers, particularly for poultry and dairy cattle. Companies such as Tyson Foods now contract with operators of large chicken farms to mass-produce animals, which the company subsequently processes and sells to consumers. Dairies and cheese factories similarly need large herds of milk cows. A partial exception is the beef cattle industry, where meat packers rely on large feedlot operations to supply them with livestock. The economic gains of purchasing feed grains and finishing out cattle, however, do not include raising those animals from birth, which is still done at separate cow-calf operations in the United States.

—Cameron Saffell

tons produced per acre. From India word of the success spread to other areas in the developing world. Since the 1960s, Green Revolution techniques have made it possible to feed the huge increases in the world population. The Green Revolution has also inspired further agriculture

research, leading to studies of genetically modified seed through collaboration between government, nongovernmental organizations (NGOs), universities, and private firms.

There have been problems and criticism of the Green Revolution in several areas. The innovations of the Green Revolution have met with success in many South Asian countries as well as in Mexico and some other areas of Latin America. However, in Africa, wars, droughts, corruption, and other problems have hindered the development of a continental Green Revolution. Furthermore, in places such as Indonesia and Vietnam, traditional agricultural practices created resistance to Western methods of agricultural production that ignored centuries-old methods that accorded with religious customs.

Critics of the ongoing Green Revolution note that environmental side effects of the introduction of large-scale agriculture include soil erosion, high water consumption, salinization, and water pollution from pesticides and fertilizers. Other critics have argued that the Green Revolution methods ultimately cannot forestall vast numbers of people perishing in a Malthusian famine. Eighteenth-century economist Reverend Thomas Malthus argued that food production increased arithmetically, while uncontrolled population growth increased geometrically. This means that it is possible for the population to outstrip its food supply if it produces too many children. As the world's population in the developing world grew exponentially in the late twentieth century, this concern continued to haunt advocates for stemming global population growth. So far, as of 2009 the Malthusian doomsday scenario has not taken place. However, critics worry that it could because the seeds supplied by seed companies are hybrids and are vulnerable to diseases. In a sense, such agriculture promotes an anti-Darwinian favoritism of a species. The possibility therefore exists that heirloom seeds that have greater genetic possibilities could be lost if they are not planted. This is critical if something happens to the seeds used to produce the ongoing Green Revolution.

Genetic Modification of Seed

With the discovery of the DNA molecule and its structure in 1953, the field of genetics began a rapid advance. By the 1970s, the ability to modify the arrangement or the types of genes in a molecule of DNA gave scientists a powerful tool for creating insect- and disease-resistant strains of plants, or the power to promote the growth of high-yield crops. Genes have been removed, spliced, or relocated in DNA molecules to create new hybrids.

The Green Revolution in agriculture that unfolded between 1945 and 1965 did not depend on gene-splicing techniques; instead, researchers developed hybrid versions of seeds to be used along with large quantities of pesticides and fertilizers. The seeds used were high-yield varieties crossbred for growth gains. The resulting monoculture created a genetic reduction in the crop seeds available. At the same time, a few seed companies with rights to these hybrids came to dominate the market. Biologists and others interested in agronomy grew concerned that the heirloom seed stocks from which hybrids were developed could die out. The heirloom seeds were closer to the original genetic pools from which seed crops such as corn, wheat, rice, and other major cereal grains come that are vital to human survival.

In the 1990s, genetically modified organisms (GMOs) were developed. Some of the GMOs were agriculture seeds, produced by the laboratory modification of genetic material in a variety of seeds. In many cases, instead of just rearranging gene material or instead of eliminating some genes, the seed was modified with the insertion of genes from a manipulated organism to, for example, make crops more disease resistant. Since the 1990s the acreage devoted to genetically modi-

fied (GM) crops has increased greatly around the world, with over half of such production in North America as of 2007. However, there have been numerous concerns raised by scientists over this use of GM foods. The concerns have been centered on the unknown effects of the consumption of genetically modified foods and the unforeseeable effects of GMOs in larger food chains and ecosystems. The opposition grew rapidly, especially in Europe, already galvanized in the 1980s after the much-publicized outbreak of Bovine Spongiform Encephalopathy (BSE), popularly known as mad cow disease. The disease is not caused by genetic modifications, but it raised fears among Europeans that industrial agricultural practices were undermining the world food supply.

Despite opposition, agricultural corporations such as Monsanto, Bayer Crop Science, and Archer Daniels Midland have continued development and production of GMOs. Scientific organizations and governments have given limited support to the use of GM seeds, including research funding. Research is currently focused on inserting drug manufacturing genes into foods that will be consumed in tropical areas in order to combat diseases. Testing of the safety of GMOs is also an ongoing project.

➤ GENETICALLY MODIFIED COTTONSEED

In the post–World War II era, cotton has continued its historic role as an important crop for fiber and seed. Cottonseeds are used to make one of the four major genetically modified vegetable oils (soy, corn, canola, and cotton) used globally. Large quantities of cottonseed oil are used in potato chip production. Increasingly, cottonseed oil is produced from genetically modified cotton plants.

The chemical gossypol is a natural toxin found in cottonseed, where it functions as a natural insecticide. Gossypol makes cottonseed oil inedible to humans unless it is further refined. Through genetic modification, varieties of cottonseed have been produced without gossypol. Other genetic modifications have focused on eliminating two fatty acid desaturase genes in cotton plants. The goal is to produce a healthier product by reducing the omega fatty acids in cottonseed oil.

Activists oppose the use of genetically modified cotton for environmental and health reasons. Those varieties that eliminate gossypol require heavy applications of insecticides to protect the cotton crop from damage. They also argue that new protein-making genes added to cotton plants may create proteins that act like prions (disease agents that damage protein molecules) in mad cow disease.

—Jack Waskey

tries and animal breeds in the U.S. and world markets since the mid-twentieth century. Production has expanded while changes in animals have largely resulted from scientific improvements in breeding. In most instances, producers in the largest beef cattle countries—including the United States, Australia, Argentina, Brazil, and the European Union—have become highly scientific and efficient, needing large areas of land and large herd sizes to maximize their production.

Prior to World War II, most beef cattle production occurred as secondary enterprises in grain-producing areas or in large ranches such as those of the American West and Australia. These areas were better suited to livestock because much of the land would not support intensive crop farming. Postwar grain improvements

➤ MAD COW DISEASE

In April 1985 a veterinarian was called to diagnose a cow in Kent, England. The animal had lost all coordination and suffered fits of aggression. By 1987 this affliction was officially named Bovine Spongiform Encephalopathy (BSE), dubbed “Mad Cow Disease” by the press. BSE is caused by prions, an indestructible brain-protein pathogen that warps normal proteins into new prions, making holes in the brain and turning it to sponge. BSE also wreaks havoc on the nervous system and major organs but apparently does not affect regular muscle tissue. As of May 2007, 160 people, all in the United Kingdom, had died after eating infected beef and developing a human version of the syndrome.

By 1988 the external cause of BSE was identified: throughout the twentieth century, cows and sheep that were old, sick, or otherwise unfit as human food were used as a cheap protein supplement in cattle feed. Thus, cows with BSE were consumed by other cows, which then became infected. The United States banned cattle imports from the United Kingdom in 1989 and beef shipments from many European countries in 1991. By the time the European Commission passed an import-restricting resolution in 1994, the epidemic had peaked in Britain with 3,000 new cases per month. Extensive regulation reforms regarding cattle feed and butchering subsequently stemmed the epidemic.

Despite the additional regulations, additional cases of BSE in cattle have been confirmed. Because the infection can be transmitted through feed products to other cattle as well as by direct consumption of the meat, when new cases occur other countries move quickly to ban all beef cattle imports from those countries. The example of how one infected animal and its by-products may be quickly distributed through tens or hundreds of other products to other areas of the world shows how closely interrelated markets, feed supplies, and pathogens have become in the global age.

and surplus production led to a shift in methods. Enterprising cattle and grain producers began feeding the excess grain to cattle. While this increased the cost of meat for consumers, the public quickly demanded more grain-fed beef because of its improved flavor and tenderness.

This has led to a reorganization of the beef cattle industry.

Most commercial beef production in the United States takes place in three stages. The first is cow-calf production, where cows breed and have calves in areas of the country where forage is abundant. The purpose is to produce steers and heifers that will eventually be slaughtered. The next stage involves a stocker operator, who takes recently weaned calves and doubles their weights by feeding them cheap forage. The last step, called finishing, occurs on a feedlot where animals spend 120 to 150 days eating mostly grains. Feedlots may have from a few hundred head to more than 40,000 beef cattle, and many are located either in large grain-producing areas or near large meat-packing facilities, where the cattle are sent for slaughter and processing.

A similar reorganization occurred in Australia. Australian producers introduced similar feedlot practices by the 1970s and expanded that country's overall output significantly. Since the mid-1980s, Australian beef has represented about 40 percent of the world's total beef production.

The amount of time and the ultimate weight of beef cattle vary based on the breed used. Breed selection and development is a science unto itself, as producers enhance the best characteristics, including reproductive traits, weaning weight and subsequent animal growth, meat quality, and minimized genetic defects. Since each attribute varies from one breed to another, finding the right combination suitable to producer, processor, and consumer is a challenge. Producers worldwide frequently utilize crossbred stock, meaning that the meat bought by a consumer is not usually a particular type. Some producer groups have tried to overcome this by marketing their breed as premium certified meats.

The dairy industry in the United States has been more diversified geographically than the beef industry because milk is perishable and shipping costs are expensive. Thus, small operations with as few as 30 milking cows can be found in many parts of the country. Industrial advances, particularly in breeding, however, have resulted in many large dairy herds being assembled to reduce expenses.

The most significant advancement for dairy production was the introduction of artificial in-

Cattle feeding on grain in a commercial feedlot. Some feedlots fatten over 40,000 head of cattle at a time. (U.S. Department of Agriculture/Brian Prechtel)

semination of cows during the 1930s and 1940s. This allowed producers to control calving and the period of lactation. Milk production has advanced rapidly as dairy management and breeding have improved. Overall, the average milk production per cow is more than three times greater than it was in 1940, a result of selective breeding and improvements in organizing dairy herds.

Globally, similar improvements in beef and dairy production are being adopted along with an increase in beef and dairy consumption worldwide. This consumption may be related to several kinds of emerging health problems including obesity and heart attacks.

Growth of Fishing Fleets and Destruction of Fishing Stock

Second only to navigation, fishing is the primary human use of the World Ocean, the global ocean body comprised of the Pacific, Atlantic, Southern, and Indian oceans. Commercial and small-scale fishing supports about 200 million people in direct employment. About 500 million others draw livelihoods indirectly from marine resources. An area in the ocean that is used for fishing is called a fishery, and these areas usually have populations of specific fish. Fish account for 16 percent of all animal protein intake in the world and may account for 40 percent or more in developing nations, Japan, and Norway.

However, fisheries are in danger. The world fishing fleet has undergone unprecedented growth since World War II, when international records began to be kept systematically. The world fish catch nearly doubled over a 20-year period from 50 million tons in 1975 to 95 million tons in 1995 as a result of increased fishing effort. This increased fishing was prompted by an ever-increasing human population but was

A fisherman along Romania's Black Sea coast reaches for a fish from a net full of jellyfish, 2005. (Robert Ghemet/epa/Corbis)

➤ FISHING TREATIES

Since the ocean is international and beyond the control and therefore management of any single agent or country, international agreements are essential for developing rules (institutions) for fishing. This has been a difficult issue since the 1600s, when Hugo Grotius's legal concept of *mare liberum* ("freedom of the seas") institutionalized the premise that there need not be any rules for ocean use. Thus, since the seventeenth century, there has been a bias in international law against setting rules for using the ocean. In part, this was a result of the popular misconception that the ocean was an infinite resource that could not be impaired by human actions.

It was only after 1958, when the first Law of the Sea convention was held, that the *mare liberum* doctrine began to be formally questioned. In 1982, when the final Law of the Sea convention was concluded, serious changes to the *mare liberum* doctrine were made, and conservation of ocean resources was institutionalized as an expectation for all countries.

More recent advances include the adoption of the Fishery Stock Agreement (United Nations Conference on Straddling Fish Stocks and Highly Migratory Fish Stocks) that went into force in 2001. This allowed regional fishery authorities to take much greater control of the fish stocks than ever before, giving them, for example, the authority to board and stop ships violating regional fishery management guidelines. The regional bodies are a recent development, so it will take some time to understand what kind of effect they have on the downward spiral of marine fisheries.

—Peter Jacques

also a result of intensive industrial investment into larger and more efficient commercial fishing fleets. This has created what economists refer to as overcapitalization, that is, an overinvestment of resources into fishing fleets.

Overcapitalization, a primary cause of overfishing, encourages more boats with improved equipment to pursue fewer and fewer fish. Fishing fleets compete with each other over the same dwindling fish stocks. In order to win these fish, fleets have not only been forced to become more

numerous but must also have the latest best gear such as sonar and refrigeration to compete. This means that each fleet continues to invest greater resources into getting their fish before competitors, increasing the pressure on stocks. This is a key reason why fishery management in the modern era has been one of the world's most pressing failures.

Most of the world's fisheries are being exploited faster than they can recover. Approximately 60 percent of the world's marine fisheries are now at or close to the decline. Worse, overfishing does not indiscriminately affect fishing populations. The most valuable fish are targeted first. These fish are typically the larger species and individuals. This means that as the world fishing fleet progresses from smaller to smaller fish, biological richness and diversity is eroded systematically. This is referred to as fishing down the food chain and has occurred worldwide. Top ocean predators have therefore seen extraordinary historic collapses in several cases. For example, in the Black Sea, populations of *Mnemiopsis* jellyfish have increased dramatically as their economically important competitors, such as chub mackerel, have been removed. This has reduced the number of main fisheries in the Black Sea from 26 to 5.

While specific fish are diminished purposefully, other marine life is diminished indiscriminately. Fishing nets can extend for miles, catching species that are not targeted and even species that may be protected. This is called by-catch, and it is a serious problem for fish populations. By-catch wastes about 27 million metric tons of fish annually, that is, almost one-third of the total annual world fish catch. When by-catch is added to the world fish catch, the total burden on world fisheries can be as high as 120 million metric tons per year. This by-catch includes millions of cetaceans (whales, dolphins, and porpoise). These figures indicate not only a tremendous waste but also an unnecessary disruption in the world food chain and a threat to ecological stability and security.

Fishing is a vital aspect of peoples' diet and economy but a threat to biodiversity. The successes of fishing fleets have put a high degree of pressure on fish stocks. In some cases, this has

led to catastrophic collapses, such as that of the cod fisheries off Newfoundland, Canada, during the 1990s that have not recovered after a full decade. These collapses then send shockwaves into the communities that depended on that work, revenue, and food source. Yet conserving fish stocks has been very difficult in the modern era given the race for fish, disregard for cautionary scientific estimates, and inappropriate goals for fisheries to produce a steady maximum across time.

Some new proposals to head off a catastrophic collapse of the world's fisheries include creating marine protected areas (which may have no-take zones where fisheries are permitted to rest), encouraging community enforcement of fishery standards (as opposed to regulation from federal governments), and a restructuring of individual fisher incentives via quotas. These incentives would involve assigning or auctioning individual permits that can be transferred or sold. To maintain the value of a license, individual holders would have a stake in conserving stocks rather than in racing to deplete them. However, the most promising strategies are based on managing large marine ecosystems, not just protecting a single species of fish but also its environment (e.g., regulating pollution in addition to regulating fishing).

Whaling Industry and Opposition

The modern whaling industry originated in the late nineteenth century as advancements in harpoon technology and shipbuilding facilitated the expansion of whaling outside coastal regions. Driven by the demand for whale oil, used primarily for lighting, the leading whaling nations—Norway, England, and the United States—constructed large whaling fleets that operated mostly in the North Atlantic and Pacific oceans.

FISHING EFFORT

Pelagic (open-sea) whaling grew rapidly in the 1930s as Japan, Germany, and the Soviet Union sent fleets to the Antarctic. During this period, Japan emerged as a major consumer of whale meat. In the second half of the twentieth century, whaling became a contentious geopolitical issue, as whale stocks declined precipitously and an influential antiwhaling movement developed.

The earliest international efforts to regulate whaling occurred in the 1930s. Negotiations among the whaling powers proved difficult because nations with entrenched interests opposed restrictions on the industry and sought control over their competitors. Nonetheless, the 1931 Convention for the Regulation of Whaling and the 1938 London Protocols established important precedents for future regulatory efforts. Most significantly, in 1946 14 nations signed the International Convention for the Regulation of Whaling. Drafted during the same period of international cooperation that witnessed the formation of the United Nations (UN), this agreement

dramatically lowered existing catch quotas and established a new regulatory body, the International Whaling Commission (IWC).

While World War II disrupted commercial whaling, the IWC quickly evolved into the main forum for regulating the industry during the postwar era. In the 1960s, members of the scientific community pressured the organization to replace existing methods for allocating quotas based on the oil content of blue whales with procedures more sensitive to the population dynamics of individual whale species. However, internal conflicts prevented the IWC from developing clear preservation objectives. Despite its 1965 hunting ban on the endangered blue whale and its success in reducing quotas on other species later in the decade, critics claimed that the organization was more concerned with the survival of the whaling industry than the protection of whales.

In 1972, the UN Conference on the Human Environment in Stockholm passed a resolution recommending a temporary ban on industrial whaling. Three years later, the radical environmental group Greenpeace staged the first of several highly publicized confrontations with whaling fleets at sea. Combined with the lobbying efforts of more moderate conservation organizations and the elevation of whales to iconic status in the environmental movement, these actions initiated fundamental change in the international whaling regime. In 1982, pressured by delegates from the United States, nongovernmental organizations, and new African and Eu-

ropean members, the IWC imposed a 10-year moratorium on commercial whaling.

The 1982 moratorium ushered in a period of intense conflict between pro- and antiwhaling nations. Japan and Norway initially objected to the ban and later continued whaling under scientific permits issued by the IWC. The leading opponents of industrial whaling—the United States, Australia, and the United Kingdom—regarded scientific permits as a cover for commercial activities and campaigned for additional protective measures, including a whale sanctuary in the Southern Ocean. At the turn of the twenty-first century, several nations continued limited whaling activities in defiance of international regulations, and the IWC remained divided over a range of issues, especially indigenous whaling practices, the economic benefits of whale tourism, and the legitimacy of scientific management.

■ Introduction: Resource Industries

Enormous resources have been extracted to supply the growth of the world population to over six billion people since the end of World War II. The world's extraction industries have greatly expanded the supplies of fossil fuels, minerals, building materials, and other natural resources to meet global population growth. The search for needed resources has pushed the extraction industries into prospecting in ever more remote areas or into searching

older areas with significant advances in technology. The new prospects have produced huge new supplies of fossil fuels, especially natural gas and petroleum. New diamond mines have been opened in Canada and Russia. New copper mines or other sources have been able to supply the world's growing demand.

The use of resources has shifted geographically. For example, the Chinese have been urbanizing since 1945. An estimated 300 million

Chinese have moved to the cities since 1975. This is the largest internal migration in the history of the world. It is expected that another 500 million will have moved into China's growing cities in the next several decades. The urban growth has required huge volumes of building materials. It has also required huge increases in electricity and other resources. What has happened in China is a common development worldwide.

The improved technologies that have increased the extraction of nonrenewable resource supplies have contributed to the world's population growth because they have reduced epidemics, famines, and the effects of other natural disasters. Critics of overpopulation argue that this level of growth is unsustainable and have advocated family planning, forced sterilization, mandatory birth control, abortion, and later marriage in order to attain zero population growth for the planet.

Many ecologists have argued that finite nonrenewable resources make modern industrial civilization unsustainable. In response to the fears that some have of running out of resources, many are urging a greater shift to renewable resources.

—Jack Waskey

Coal, Oil, and Natural Gas

In recent decades, the world's energy planners have been presented with three challenges, sometimes in conflict: to bring forward sustainable energy sources of all kinds, to reduce dependence on greenhouse gas emissions caused by hydrocarbon fuels, and to reduce the heavy dependence of almost all societies on oil. In addition to concerns about the turbulent Middle East where two-thirds of the world's proven oil reserves still lie, there are also geopolitical challenges to Russian gas supplies on which Western Europe has developed a heavy dependence, the perils of political sabotage of oil and gas pipelines, and the shadow of potential terrorist action against major oil installations and facilities.

The task of displacing fossil fuels even marginally with genuinely sustainable and truly low-carbon alternatives cannot be minimized. Nor are the most-favored green renewable sources with-

Coal-fired electrical power plant in China. One of many built since the 1980s. (Danny Zhan)

out their downsides. (To give one example, the front-running biofuel, ethanol, widely used already in Brazil, involves clearing rain forests to plant the necessary soya and sugar cane.) Solar power has yet to prove competitive on a large scale, while nuclear power continues to raise waste disposal problems and meet strong political resistance. Perhaps the most realistic assessment of world energy needs is to be found in the 2006 United Kingdom energy policy review, which states bluntly that oil, gas, and coal will continue to dominate the energy supply chain for many years to come.

Coal has long been an important fuel, and large reserves remain. North America, India, and China together possess two-thirds of the world's coal reserves, while the United Kingdom and the rest of Europe also retain very large commercially exploitable deposits, despite coal having been the key energy source of the Industrial Revolution of the eighteenth and nineteenth centuries, with enough to meet energy requirements for hundreds of years. Sixty percent of U.S. electricity comes from coal-fired power stations, and 120 more coal-fired stations are being planned or are under construction in the United States alone. Many more are now being constructed in China to help meet the enormous energy demands of that country's rapid economic and industrial growth.

Coal is cheap but dirty. It is full of carbon and sulphur. Because coal is a relatively inert

> LPG

Liquefied petroleum gas (LPG) is a mixture of hydrocarbon gases—propane and butane—extracted from oil and gas. LPG exists as a gas at normal atmospheric pressure and only becomes liquid at very low temperatures or under pressure. When the pressure is released, the liquid boils and forms a vapor. It is this vapor that is used to fuel appliances. The calorific value of LPG is about 2.5 times higher than that of methane gas, so more heat is produced from the same volume. LPG is carried by sea in large quantities. Carriage temperatures are around -44°C for propane and -5°C for butane.

Many domestic and commercial applications of LPG are similar to those of natural gas, but because of its physical state and mobility, LPG can be put to a number of other uses that are normally outside the scope of natural gas. LPG is used for space and water heating, cooking and air conditioning, industrial or agricultural processes, and power for vehicles and fleets.

—Carole Nakhle

solid, cleaning the coal before burning to remove sulphur is almost impossible. The exhaust gas in the smokestack is chemically more accessible, but removing carbon dioxide, sulphur, and mercury from smoke remains a costly technological challenge. One potential approach is the underground gasification of coal: turning coal to gas underground, cleaning it, and making it sulphur- and carbon-free, with the carbon being piped away and stored underground or under the sea.

Oil reserves are less certain than coal. Proved reserves (quantities that have a better than 90 percent chance of being produced over the life of the field) were estimated to be 630 billion barrels in 1975. In 2005, the estimates of proved reserves climbed to 1,189 billion barrels. Oil resources are also highly concentrated. The Middle East, which is more likely to strike oil than water, holds more than 63 percent of the world's total oil and gas reserves. Technology has opened up more accessible and profitable oil reserves and has improved recovery rates. A few decades ago, the average oil recovery rate from reservoirs

was 20 percent, but this rose to about 35 percent by 2006. Nevertheless, currently two-thirds of the oil known to exist in reservoirs is still abandoned as uneconomical. The energy crisis has also led to the examination of using unconventional oils, such as Canadian tar-sands and bitumen oil from the Orinoco belt in South America and elsewhere.

At one stage, when oil companies used to find a gas well they tended to call it a dry hole. But given the main concerns surrounding oil (rising oil cost, supply disruption, and CO_2 emissions as a result of burning oil), interest has shifted toward natural gas (methane), and attitudes have changed. Natural gas is the lightest end of the hydrocarbon resource. Per unit of volume, natural gas contains 1/1,000th the heat energy of oil. Once processed and treated to remove impurities, gas provides a clean burning fuel. Its carbon emissions are 40 percent lower than oil. Gas is ideal for heating and for gas turbines. Natural gas is also an abundant energy source, with Russia the world's largest holder of gas reserves. Gas reserves have grown rapidly, now even exceeding oil. Similar exploration and drilling techniques are used for both oil and natural gas. But gas is moved in pressurized pipelines, whereas oil can be transported in both pipelines and tankers.

Liquefied natural gas (LNG) transported by ship is seen as a practical if costly worldwide alternative. LNG is methane that has been super-cooled beyond the point at which it turns into liquid (-163°C). It occupies 1/600th the volume of gas and can be loaded into insulated ship tanks, shipped to consumer country destinations, and then warmed and regasified into its original form and pumped into local grids. The whole process also requires building special terminals to receive the LNG, warming it up, and feeding it into national and local gas grids. But technology is bringing costs down, and more LNG terminals are being built worldwide.

While fossil fuels are viewed as culprits in the battle to limit greenhouse gases, they remain the lifeblood of the world economy and will remain so for years to come. The task will be to use all the instruments of technology to increase energy end-use efficiency, to accelerate competitive alternatives, and to forge an ecofriendly al-

liance between Earth's environment and the growing world population's legitimate needs for safe and affordable energy supplies.

Strip Mining

Strip or surface mining, one of the earliest of mining techniques, involves digging to remove topsoil that covers shallow mineral deposits. This method is most commonly used to extract coal. Strip mining is often chosen when coal is flat-lying and close to the surface. The method, which is used in Africa, the Americas, Asia, and Europe, is less expensive than underground mining and does not involve the high loss of life and accident rates associated with underground mining. Since the 1970s, the rate of strip mining has rapidly increased. Soaring global energy prices and new technology have made it economically feasible to extract thin seams of coal embedded in hilltops that previously were too costly to mine. However, the environmental impact of strip mining is severe. Many communities, including many indigenous groups, oppose strip mining because of its side effects.

Strip mining includes such environmentally destructive techniques as mountain top removal. In this technique, particularly popular in the Appalachian Mountains in the United States, the top of a mountain is blown off with an explosive mixture of ammonium nitrate and diesel fuel. A seam of exposed bituminous coal is revealed. A dragline, an excavating machine with a bucket that is operated by lines, is then used to strip out the coal. The mountain top is not replaced. Trees, topsoil, and sandstone are dumped into the valleys below. Local water supplies are polluted with mercury and other chemicals used in

Heavy machinery at work at a North Dakota strip mine. Coal is the fuel used for much of the world's electrical energy production. (Pastel Dakota Photo)

mining. More than 1,000 miles of streams have been buried in this way, and an Environmental Protection Agency study found that 95 percent of headwater streams in the United States near mines have been contaminated by heavy metals leeching from the sites. The habitat of many plants and animals is ruined, and the landscape is permanently scarred.

If mining companies attempt to reclaim strip mined land, the most common strategy is to spray grass seeds to create pasture. This technique does little to restore the environment. Forest animals and plants do not survive in grassland, while forests remove carbon, prevent flooding, purify water, and prevent erosion. Accordingly, in 2004 the U.S. Office of Surface Mining developed the Appalachian Regional Reforestation Initiative, a cooperative effort to restore forests damaged by strip mining. The best way to help forest regrowth is to plant saplings in the loose mix of sandstone and shale, known as spoil that mines leave behind. Hardwood trees, such as chestnuts, poplars, and ash, grow rapidly in this soil because there is ample room for root growth and no competition from established trees. The porous soil acts like a sponge during heavy rainfalls and greatly reduces the flooding caused by compacted strip mines.

No international organization has mechanisms in place to guarantee that strip mining companies observe international human rights

► COAL MINING ECODISASTER

Coal mining is far from being a green endeavor. The worst ecological disaster in the United States since the Exxon Valdez oil spill took place in Kentucky on October 11, 2000, when 300 million gallons of coal sludge filled 75 miles of waterways. The thick, black goo, a wet mixture produced by the treatment and cleaning of coal, came from a ruptured mountaintop coal waste impoundment lake near Inez, Kentucky.

The sludge filled the main stem of the Big Sandy River, the Tug Fork, and some of its tributaries, including Coldwater and Wolf creeks. The Kentucky Division of Fish and Wildlife Resources estimated that 1.6 million fish as well as countless salamanders, frogs, and turtles were smothered in the disaster, including every fish in the two creeks. Lawns were buried in up to seven feet of sludge.

Martin County Coal paid \$3.25 million in penalties and damages to the State of Kentucky and restocked affected waterways with fish. By 2005, lawns had again turned green, and streams were clear. However, the coal sludge remains in the soil despite a \$46 million cleanup. Residents of the area worry that the sludge may have long-term health effects.

—Caryn E. Neumann

and environmental standards. Some communities have fought back. In 2006, Mayan Indians occupied land near Lake Izabal in Guatemala that a Canadian company planned to strip mine for nickel. The Mayans cited a 1996 UN-sponsored peace agreement that ended Guatemala's brutal civil war and gave indigenous communities with historical claims to land the right to determine how it is used. Strip mining on Mayan Indian land had already damaged the ecosystem in the region by causing soil erosion, deforestation, landslides, and a host of other environmental woes. Meanwhile, international mining and exploration companies are pursuing strip mining in the Zambezi coal basin of Africa, one of the world's largest and least explored coal regions. The shallow dips and potentially vast resources of the coal seams make this region particularly amenable to strip mining.

The high price of oil has increased demand for alternative fuels. Coal is already the source for about half of the world's power. While it is cheaper than oil, it is not necessarily a better choice because of the environmental impact of coal extraction and coal use.

—Caryn E. Neumann

Global Nuclear Power Industry

The development of nuclear power for the domestic production of electricity began after World War II. On June 27, 1954, the Soviet Union connected the world's first commercial nuclear power plant, which produced 5 million watts, or 5 megawatts (MW) of power, to its electrical grid at Obninsk. Although corporations headquartered in the United States dominated the global nuclear industry in the nonsocialist world through the 1960s, by the 1970s firms representing countries worldwide also competed in a global nuclear marketplace with an installed capacity of 100 billion watts, or 100 gigawatts (GW). The growing antinuclear movement tempered the rise in demand for nuclear power that immediately followed the oil crisis of 1973–1974, and by the late 1980s and early 1990s the industry suffered under severe market stagnation. The worldwide capacity of 300 GW in the late 1980s increased only to 366 GW by 2005. In the late 1940s, a world faced with the specter of atomic warfare turned to the promise of nuclear power

President Dwight D. Eisenhower delivers his famous "Atoms for Peace" speech to the United Nations, 1953. (United Nations)

as a so-called peaceful use of the atom. Beginning in 1945, nearly every nation-state formed a government-run agency to explore the development of nuclear power. Affordable nuclear energy appeared to be just around the corner, and Lewis L. Strauss, chairman of the U.S. Atomic Energy Commission, in a 1954 speech to the National Association of Science Writers characterized the sense of optimism in his famous phrase "electrical energy too cheap to meter." U.S. president Dwight D. Eisenhower buoyed the promise of nuclear power with his "Atoms for Peace" speech made at the United Nations on December 8, 1953, in which he proposed international cooperation in developing atomic energy.

The U.S. corporations General Electric and Westinghouse benefited from government subsidies and U.S.-sponsored technical exchanges with governments across the globe. Beginning in 1963, the two companies made available turn-key nuclear reactors (that is, nuclear power plants completely built and placed into operation prior

to handing them over to the buyer) at prices that were competitive with fossil-fuel plants. U.S. enrichment services enjoyed a virtual monopoly in the supply of uranium fuel for these reactors, which dominated the world market. During the 1960s, these firms also engaged in a number of technology-licensing agreements and joint ventures with foreign companies, many of which were owned in whole or in part by the partnering U.S. corporations. However, state-sponsored companies in Canada, France, the Soviet Union, and West Germany soon undercut the market dominance of these multinational corporations.

The creation of the Nuclear Suppliers Group (NSG) by Canada, France, Japan, West Germany, the Soviet Union, the United Kingdom, and the United States in 1975 signified both the increase in the number of companies that made up the global nuclear industry and the growing desire to curb the proliferation of nuclear weapons without impeding the spread of nuclear power. The NSG responded to the successful Indian nuclear test in 1974, which demonstrated that peaceful nuclear technology could easily be used for weapons development, by agreeing to limit and regulate the trade of nuclear technology. The original 7 nations of the NSG grew to 45 members by 2005, with representatives from every part of the world. Although the global antinuclear movement used nuclear power plant accidents such as those at Three Mile Island (1979)

➤ NUCLEAR REACTORS AROUND THE WORLD

Nuclear power grew as a viable energy source in the last decades of the twentieth century, particularly in many Western countries. As is evident in the above map, the vast majority of the world's nuclear facilities are in North America, Europe, and Japan. However, many developing states have also developed their own nuclear reactors, most notably India and China.

—Abraham O. Mendoza

NUCLEAR POWER PRODUCERS, 2005

and Chernobyl (1986) to slow or stop the expansion of nuclear power, the large number of nuclear power plants still in operation continued to keep the nuclear industry in business.

At the start of the twenty-first century, many nations remained heavily dependent on nuclear power. As of 2001, nuclear power met more than 75 percent of the electrical demand in France and approximately 50 percent of the demand in Japan. However, while in 2006 new nuclear power plants were under construction or being planned in Argentina, Brazil, Bulgaria, Chile, China, Japan, the Czech Republic, Turkey, and the United States, previously nuclear-dependent nations such as Germany, Sweden, and Switzerland were evaluating plans to phase out nuclear power.

Global Water Crisis

Over the course of the twentieth century, worldwide withdrawals of freshwater from lakes, rivers, and subterranean sources increased approximately sevenfold. The most marked increase in water withdrawals occurred in the period from around 1940 to 1990, mainly as a result of the expansion of irrigated agriculture. During the same period, the world's human population approximately tripled, making the increase in water use more than twice that of population growth. By the early 1990s, awareness of the decreasing availability of water per capita induced water specialists and environmentalists to declare that a water crisis on the global scale was immi-

➤ BOLIVIA AND BECHTEL

In September 1999 the engineering company Bechtel signed with Bolivian president Hugo Banzar to privatize the water supply in the city of Cochabamba. Water prices went up by 200 percent, causing massive protests among the poorest elements of the city. After brutal repression by the government and national unrest, the contract was withdrawn. Bechtel filed suit against the Bolivian government in 2001 for \$25 million in damages. However, after international protests, they settled for a symbolic settlement of 30 cents. This episode indicates the growing geopolitical importance that water will have in the future as local governments tend more and more to seek outside help to bolster waning water supplies.

nent. Expressions of concern about the water crisis have been made with increasing frequency since that time, with a host of multilateral agencies, public interest groups, academics, and commercial interests joining in the call for focused, coordinated attention to water.

Several factors need to be considered when explaining the emergence of concern for a global water crisis in the late twentieth century. Progress in internationally coordinated hydro-metric data gathering, especially since the 1960s, that monitored regional and global freshwater availability and use provided data from which predictions of a global water crisis could be extrapolated. The emergence of the modern environmental movement in the 1970s and concern about the degradation of aquatic ecosystems brought the ecological significance of freshwater to the fore by the 1980s. Awareness of water pollution, loss of aquatic habitat, and threats to freshwater biodiversity exacerbated the growing concerns about quantities of water available for human use. By the 1980s, the fact that groundwater was being depleted (used at rates that exceeded those of natural recharge) in many parts of the world became widely acknowledged. Statements such as that made by Ismail Serageldin, vice president of the World Bank in 1995, that the wars of the twenty-first century "will be over water" reflected the growing sense that

water had become a critical global issue. The elaboration of indices such as water stress and water scarcity in the 1980s and 1990s allowed for the graphic representation of present and projected water availability per capita over a territory such as a country or drainage basin. These indices have been widely used to convey the severity of global water problems. For example, the third United Nations World Water Development Report (2009) warned that about half the world's population is likely to be living in areas of high water stress by 2030 due to population growth, climate change, and increased irrigation demands. Perhaps most importantly, despite international efforts during the International Drinking Water Supply and Sanitation Decade (1981–1990), it was estimated that over one billion people lacked access to safe drinking water and that over two billion people had no access to sanitation services in the early 1990s, a situation that has worsened in the twenty-first century.

The idea of water crisis on a global scale became popularized in the 1990s. Publications such as *Water in Crisis* (1993), edited by Peter Gleick, brought the latest scientific findings on water availability and water use to audiences in the English-speaking world. The notion of a global water crisis was readily taken up by the more popular press and by groups and institu-

tions with interests in water. Among these institutions, the World Water Council (WWC) is perhaps the most important. Convened in 1996 by the World Bank, the United Nations Development Programme, representatives of the water services industry, professional water associations, and water policy experts, the WWC has organized a series of high-level meetings known as the World Water Forum every three years. The First World Water Forum took place in Marrakech, Morocco, in 1997, followed by meetings in The Hague (2000), Japan (2003), Mexico City (2006), and Istanbul (2009).

More recently, the rhetoric of a global water crisis has to some extent given way to a recognition that water problems, although unquestionably urgent and massive, occur in the context of particular hydrological, ecological, and social circumstances and that these circumstances vary enormously from place to place.

■ Introduction: Land Use and Population

The exponential growth of the world's population in the decades following the end of World War II, particularly in much of the postcolonial developing world, has resulted in widespread poverty, social unrest, and political instability. In 1900, world population was approximately 1.6 billion. The world's population as of mid-2007 was estimated to be approximately 6.6 billion people. A postwar surge in demographic growth occurring throughout the developing world (i.e., Latin America, sub-Saharan Africa, Asia) contrasts with a protracted population decline in many of the developed nations (i.e., the European Union, the United States, Japan), contributing to a gap between the wealthy aging

North and the poverty-stricken yet younger South. The challenges of the population explosion of the late twentieth and early twenty-first centuries, however, have been met with greater international collaboration. Such cooperation is evident in policies enacted by international institutions such as the United Nations, nongovernmental organizations (NGOs) such as the International Red Cross, or the multination International Conferences on Population and Development that have focused on developing a collaborative solution to global population growth.

Famine, poverty, and environmental destruction are recurrent problems associated with the rapid expansion of the world's population. Wide-

spread famines, resulting from inefficient economic planning, civil conflagrations, large-scale droughts, and poor harvests affect vast areas of dense population, particularly in the Horn of Africa (i.e., Ethiopia, Eritrea). Dire economic conditions in much of the developing world (i.e., sub-Saharan Africa) and nations fraught with burgeoning populations and governments that are hard-pressed to provide enough employment and resources for their respective citizenries result in widespread poverty and squalor amid rapid urbanization and its attendant social ills. Also, some experts speculate that global population growth will create significant environmental damage, with increased demand on resources leading to the further degradation of ecosystems.

In addition to causing severe stresses on the world's environment and economic stability, global population growth has ignited international cooperative efforts to implement policies that will stabilize growth or reverse the demographic expansion. Through a host of international institutions, such as the United Nations and the International Red Cross, the global community continues to address the issue of demographic growth in much of the developing world. In addition, national governments faced with gigantic domestic populations, such as China and India (2007 estimates: China at 1.3 billion and India at 1.1 billion), have developed their own state-centered policies to stabilize their own populations.

Geography of Population

The world's human population, estimated to be 6.4 billion people in 2005, is unevenly distributed throughout the continents of Asia, Africa, Europe, South America, North America, and Oceania (Australia). Vast population growth since the end of World War II is evident in the post-colonial world, while a steady long-term popula-

While Japan has the highest life expectancy in the world, its rapidly aging population is reaching inordinate proportions. (Corel)

tion decline is currently under way in Europe and North America, creating a wide demographic gulf between the aging and prosperous North and the youthful and impoverished South. Within individual nation-states particularly in the developing world, rural populations have decreased in light of the continual migration of people into urban areas, creating gigantic metropolitan conglomerations (i.e., Mexico City, Mumbai, Cairo, and Jakarta) characterized by unsuitable infrastructure, blight, and surrounding shantytowns.

The bulk of the global population is concentrated in Asia with an estimated collective population of 3.9 billion people and possessing the two most populous countries in the world, China (1.3 billion) and India (1.1 billion). Africa is estimated to approach 1 billion people sometime in the twenty-first century, with a current population of approximately 906 million, most of which resides in sub-Saharan Africa (752 million). Europe has an estimated 730 million people, including Russia (143 million). Latin America (South America, the Caribbean, and Mexico) follows with approximately 559 million. North America (the United States and Canada) possesses 329 million inhabitants. Lastly, the continent with the smallest population is Oceania (Australia, New Zealand, and the South Pacific Islands) with an estimated collective population of 33 million.

► TOP TWENTY-FIVE COUNTRIES AND AREAS RANKED BY POPULATION, 2007

Rank	Country or Area	Population
1	China	1,321,851,888
2	India	1,129,866,154
3	United States	301,139,947
4	Indonesia	234,693,997
5	Brazil	190,010,647
6	Pakistan	164,741,924
7	Bangladesh	150,448,339
8	Russia	141,377,752
9	Nigeria	135,031,164
10	Japan	127,433,494
11	Mexico	108,700,891
12	Philippines	91,077,287
13	Vietnam	85,262,356
14	Germany	82,400,996
15	Egypt	80,335,036
16	Ethiopia	76,511,887
17	Turkey	71,158,647

—Abraham O. Mendoza

The unequal distribution of population growth is characterized by the substantial population increase in much of the so-called developing and impoverished nations (what some commentators call the South) and the long-term demographic decline in the economically prosperous Europe and North America (the North), leading to a significant gap in geographical demographic distribution between these two world

regions. Advances in medicine have decreased the death rates and increased the birth rates in many countries south of the equator and thus supported an exponential population growth. However, such population increases have created new pressures on developing countries, which are generally unable to provide social services and employment for their growing populations. Populations in the developing world tend to be younger, composing a substantial plurality of the populace in many cases such as in Nigeria, where people 15 years old or younger constituted approximately 43 percent of the national population in 2005. In contrast, the developed world in the North, particularly Europe and Japan, has seen a long, steady decline in population. Economic prosperity in the past century has imbued the ideal of a cost-effective small family, typically around 1–2 children. This has resulted in the aging of these populations as native birth replacement rates have effectively declined to 1 birth per 1 death, severely straining state welfare systems. Germany's population of people aged 65 and older constitutes an estimated 18 percent of the population, while people aged 15 and younger form only 15 percent of the total. While the United States and Canada have been receptive to allowing immigrants to supplant their native aging populations and ensure economic growth, Europe and Japan have effectively restricted immigration and asylum. However, immigrants from the developing world seeking better economic opportunities continue to enter the wealthy North through illegal immigration or as refugees.

Within individual nation-states throughout both the developed and the developing world, rapid urbanization follows massive migration from the countryside into the cities, fueled by the promise of a better life and a better standard of living, and this further contributes to the growing of unsustainable urban populations. The wealth and prosperity of the developed world allow such urban areas to function adequately as international hubs for commerce, culture, and tourism. However, in the developing world this has led to massive increases in metropolitan areas unable to house and provide essential services for recent arrivals. These new megacities of the developing world are also unable to pro-

vide sufficient employment opportunities for the burgeoning urban population, leading to high levels of poverty, poor living conditions, and health issues. As a result of the lack of adequate housing, many new arrivals choose to live in impoverished shantytowns around the metropolis characterized by makeshift housing made of cardboard, corrugated metal, and other recycled materials. These huge urban conglomerations (i.e., São Paulo, Brazil, with a population of 17.7 million; Mexico City, Mexico, with a population of 17.4 million; and Manila, Philippines, with a population of 14.75 million) number in the tens of millions and are fraught with poverty, unemployment, and continuing growth from native births and rural immigration.

Population Pressure Problems

The world's population has grown from an estimated 2.5 billion in 1950 to 6.4 billion people in 2005. Some experts believe that this increased population will have considerable environmental and social impacts, including the depletion of natural resources, the degradation of the environment, issues attending massive transnational migration, and conflicts regarding control and access to water supplies and arable land. Economic disparity between the developed and the developing world, political and ethnic conflict in various world regions, and economic globalization add further complexity to the pressures that population growth creates globally.

The impact of population growth on natural resources and environmental destruction is considerable. In the developing world, population growth and economic pressures trigger an increase in the consumption of resources and the depletion of renewable resources no longer able to regenerate due to excessive extraction. Food

➤ GRAYING POPULATIONS IN THE UNITED STATES, THE EUROPEAN UNION, AND JAPAN

Population decline in the developed world, particularly in the European Union, the United States, and Japan, has led to considerable public debate regarding the future of the welfare-state and of immigration policies. The United States, while experiencing large growth in its aging demographic, particularly the baby-boomer generation, has offset this decline in its younger population through immigration. Immigration together with native birth rates, while sustaining the U.S. welfare-state, will be unable to continue to do so in the future due to the growing costs of sustaining such a large social security system. The states of the European Union and Japan have experienced a decline of their fertility rates below replacement levels (birth rates), which in turn has resulted in population decline (birth rates lower than or equal to death rates). This has resulted in a vast increase of the aging population relative to the younger working population sustaining the welfare-state. Low fertility rates are likely to slow economic growth, while the large aging population threatens to overwhelm social security and medical systems. Costs of such systems are already stressing national budgets in Germany, France, and Japan. Legal immigration is posed as a solution, but problems over national identity and fears of terrorism have led to reaction against allowing large numbers of migrant laborers and asylum seekers. As of 2007, Japan was placing hope in a *deus ex machina*, that is, the development and manufacture of robots that could aid in home care of the elderly and thus stave off health care and immigration woes.

—Abraham O. Mendoza

supply issues due to soil depletion, erosion, and inadequate distribution networks can lead to famine and social unrest, particularly in sub-Saharan Africa. The rise of the standard of living globally, especially in China and India with their populations of well over 1 billion, further contributes to the degradation of the environment, as it increases energy consumption, pollutant levels, and global warming. Scarce water supplies in arid regions can cause friction between neighboring states, such as Israel and Jordan (Jordan

River), Egypt and Ethiopia (Nile River), and Syria and Turkey (Euphrates/Tigris River).

Increased international migration, in the form of illegal immigration and asylum seekers, fueled by the need of developed countries for cheap labor and the poverty of the developing world is a huge problem related to global population growth. The developed world's (i.e., the United States, the European Union, Canada) need for low-wage unskilled labor attracts transnational migrants from the developing world who wish to escape poverty and instability in their countries of origin. Aging populations in the European Union necessitate a steady supply of workers to pay into their welfare-state systems due to native population decline. Nativist reactions in the host countries, with a discourse related to cultural identity and global terrorism, have recently led to legislation restricting the flow of laborers and asylum seekers, contributing to a significant increase in illegal immigration. In addition, transnational communities, particularly Muslims in Europe, have caused concerns about the growth of global Islamic fundamentalism within immigrant communities in the United States, Canada, the United Kingdom, France, and Germany. After the September 11, 2001, attacks in the United States and the July 7, 2005, attacks in London, transnational Muslim communities, socially and economically alienated in their host countries, have gained significant nativist attention leading to severe restrictions in immigration and asylum inflows.

Population and Famines since 1945

Following World War II, the incidence of famines increased as a result of faulty economic planning

(particularly by communist regimes in the Soviet Union and China), ethnic conflicts and civil wars (especially in sub-Saharan Africa), and poor harvests caused by droughts coupled with faulty distribution networks (particularly in the Horn of Africa). Exponential population growth in developing regions, amid widespread poverty and political instability, has made these regions even more vulnerable to food shortages. This has resulted in millions of deaths despite significant agricultural advances and massive humanitarian aid from Western countries and nongovernmental agencies (NGOs) to these affected regions.

World War II brought widespread destruction across vast swaths of Europe, North Africa, and Asia. The chaos of invading armies, aerial bombings, and swarms of refugees devastated food-distribution networks. In the aftermath of the war, both the Soviet Union and Vietnam suffered famines. The Soviet Union experienced a major famine during 1946–1948 as Stalin's new agricultural policy, part of a misbegotten attempt to reconstruct the war-torn Soviet economy, led to an estimated 1 million to 1.5 million deaths. Faulty economic planning on the part of the Soviet bureaucracy, akin to the mistakes that led to the Ukrainian famine of 1933–1934, played a significant part. The Vietnamese famine that occurred in northern Vietnam from 1944 to 1945 during the Japanese occupation of the country led to an estimated 400,000 to 2 million deaths. The effects of the war had disrupted the economy of Vietnam, historically barely able to sustain itself. A drought in Vietnam accompanied by the efforts of the Vichy French colonial government (under Japanese tutelage) to reform the regional economy for the war effort ripened conditions for famine. In these two examples, the disruptions of war and inadequate government planning contributed to millions starving.

During the Great Leap Forward (1958–1960), the Chinese communist government under the leadership of Mao Zedong and his radical ideological principles organized the nation's agriculture into vast communes, prohibiting the use of small plots for personal use. Forced collectivization eliminated incentives for peasants to work productively, thereby affecting aggregate national output. Agricultural methods based on Soviet pseudoscience (championed by biologist Trofim

Lysenko), such as close planting and deep plowing, led to bad harvests and depleted soils, which further cut total output. Moreover, iron and steel production was heavily emphasized over agriculture, resulting in millions of peasants being diverted from agriculture and put into work to augment industrial output. Such drastic changes in agricultural organization coincided with poor weather conditions, resulting in droughts and floods and further triggering food shortages. For example, in 1959 the Yellow River flooded in eastern China. As a result of these factors, grain production in China dropped from 1959 to 1962 and only recovered after the end of the Great Leap Forward. While scholars debate the total number of deaths, they are enormous. Estimates range from 20 million to 40 million, with some scholars posing even larger totals. Similar economic policies by communist states such as Cambodia (famine, 1975–1979) and North Korea (famine, 1996) resulted in similar outcomes.

Ethnic strife, warfare, droughts, and poor harvests have led to a variety of famines in sub-Saharan Africa and the Horn of Africa. Despite continued United Nations (UN) and Western aid (the United States, Canada, the European Union, Japan, and NGOs), many African nations continued to suffer due to constant civil strife and inadequate food distribution networks overseen by corrupt and inadequate bureaucracies. Refugees and noncombatants were extremely vulnerable to starvation amid these endemic crises. Famines in Sudan, Ethiopia, Somalia, and the Congo (Zaire) have been a consequence of political instability, economic disruptions, social upheaval, widespread drought, absence of infrastructure, poverty, and warfare. In combination with genocide, rape, other human rights abuses, and disease, famines in Africa have resulted in millions of dead in the second half of the twentieth century. Exponential population growth in Africa further exacerbates the situation, creating more mouths to feed amid a dearth of food supplies.

Global Responses to Population Explosion

Responses to exponential human population growth since the end of World War II range from international conferences convened to arrive at a joint global population policy, the development of international nongovernmental agencies (NGOs) advocating the widespread use of contraception, and Chinese and Indian legislation designed to curtail multiple births given their billion-plus populations. NGOs, working under the guidance of the United Nations (UN) and funding initiatives from the U.S. and European governments, have enacted various programs in the developing world to deter population growth.

UN-sponsored world population conferences known as the International Conference on Population and Development (ICPD), to which most countries send representatives, have been held in Bucharest (1974), Mexico City (1984), and Cairo (1994). Global population policy approved by a majority at Bucharest supported full gender

➤ ZERO POPULATION GROWTH

Sociologist and demographer Kingsley Davis (1908–1997) is credited with developing the concept of Zero Population Growth (ZPG) as a potential solution to the global population explosion. ZPG is a condition of demographic balance in a specified population in which the birth rate is equal to the death rate, resulting in neither growth nor decline. The writings of biologist Paul Ehrlich, particularly his first book *The Population Bomb* (1968), made ZPG a rallying cry of the environmentalist movement in the 1970s. Other demographic planners and environmentalists have adopted the ZPG philosophy, insisting that reducing population growth is essential for the health of Earth's environment. However, variables not taken into consideration in ZPG include immigration and economic considerations, which both make ZPG unsustainable. For example, Germany's population is characterized by zero growth with a large aging population and a smaller number of younger demographic segments, a considerable part of which consists of immigrants, resulting in pressures on its welfare-state system. Likewise, many critics detected a racist assumption hidden in ZPG similar to that of the eugenics movement of the turn of the twentieth century in which Westerners expressed fear of the "passing of a great race."

—Abraham O. Mendoza

equality as a tactic to lower birth rates, given the accepted correlation between a woman's education and how many children she will bear. The Mexico City meeting was characterized by the U.S. decision to step back U.S. efforts on population control, a result of the primacy of conservative politics domestically. The most recent ICPD meeting at Cairo (1994) addressed issues in regard to the environment, gender equality, the role of NGOs, and universal education. It was also marked by the return of the United States in terms of its continued engagement in world population policies. Most of the tactics posed are aimed only at developing nations, responsible for most of the world's population growth, and not for the developed world, given the stabilization and actual decline of populations in the more affluent world regions (the United States, Canada, Europe, and Japan).

The role of NGOs in global population responses increased after the Cairo ICPD and has buttressed the efforts of the UN Population Fund (UNFPA) and the U.S. Agency for International Development (USAID). For example, NGOs such as International Planned Parenthood and the Ford and Rockefeller foundations, among others, have contributed funds and programs to help national efforts throughout the developing world, particularly in sub-Saharan Africa, to stem their rising demographic growth rates. These NGOs provide contraception information and services, family planning programs emphasizing the benefits of smaller families, condom distribution, and media campaigns designed at changing attitudes regarding women's status in society in various developing countries around the world, in cooperation with their national governments.

Both China and India, each with populations exceeding 1 billion people, have responded by enacting antinatalist legislation to slow population growth. In 1971, China enacted the *wan xi shao* campaign (later marriage, longer intervals between births, and fewer children), which later evolved into the One Child Policy in 1979. This policy gives couples incentives (child support subsidies, higher pensions in retirement, and better housing) and penalties (higher taxes and full cost of medical and educational services) to encourage them to have only one child. Critics of China's population legislation accuse it of being near compulsory birth control. India's efforts began in the 1950s with increased funding for research and programs for contraception. In 1976, monetary incentives and family planning programs were implemented to help stall further growth. Proposals for compulsory sterilization after the birth of a third child proved to be too controversial and were dropped. Indira Gandhi's advocacy of such measures led to her election loss of 1980. Both China and India have managed to raise awareness of the issue of uncontrolled population growth. However, they have not managed to completely stop overall population growth. This is due to the fact that most of their populations are younger and hence more fertile and even with one child still contribute substantially to the total number of births given their gigantic populations.

Suburbanization since 1945

Suburbanization refers to the postwar phenomenon across much of the developed world regarding population movement from major cities and metropolitan areas to developing communities in surrounding rural areas. Former residents of metropolitan areas migrated en masse from the central business district of major cities to adjacent communities from which they were able to commute to work in the city while maintaining a relatively safe distance from the chaos associated with city life. However, the flight of the middle class and the affluent from city centers encouraged the gradual decay of many urban areas due to the loss of revenues for the local tax base and lower property values, contributing to growing poverty and crime rates. This process has been common to countries such as the United

States, Canada, Britain, and Australia since the end of World War II.

According to experts, the process of suburbanization is directly related to specific push-and-pull factors that persuade people to leave the city center for the surrounding suburbs. Rising inner-city crime rates, overcrowded urban centers, pollution, burgeoning numbers of non-white ethnic communities (particularly blacks and Hispanics in the United States), and automobile traffic and the lower quality of life associated with inner-city areas (i.e., slums, government housing, urban decay) would be among the more significant push factors associated with city life. In contrast, pull factors encouraging migration to the suburbs include the allure of open spaces closer to natural environments, significantly less expensive home prices and property taxes relative to that of the city initially, and the quality of life associated with home ownership, all of which have been promoted in advertising and popular culture.

In the late nineteenth century, rail and boat travel spurred the first suburban developments outside major cities such as New York City and London, providing the affluent with a taste of country life. In the immediate postwar period, however, the United States, Britain, Australia, and other developed countries in much of the West experienced a massive economic expansion, triggering the development of suburban housing tracts surrounding major metropolitan areas. The most famous example—Levittown in Long Island, New York, built in the 1950s—best exemplifies postwar suburbia as a new development in mass housing. U.S. government policies such as the construction of an efficient network of interstate highways and freeways and the underwriting of mortgages for suburban housing had significant impact on suburbanization. Similar government policies in Britain and Australia by their respective governments also spurred migration to the suburbs by the affluent middle classes. In addition to the growing population and affordability of the automobile, improvements on existing railway networks, bus routes, and other means of public transport also made suburbanization a feasible option.

Debates over the consequences of suburbanization in much of the developed world are

➤ LEVITTOWN

In 1947, a new \$50 million housing development plan, later dubbed Levittown in Long Island, New York, began to redefine American suburbia and the middle class. After World War II, young veterans starting families spurred a nationwide housing shortage. In response, William Levitt and his brothers invented an assembly-line method for building identical four-room houses using standardized prefabricated parts. By mid-1948, their teams of carpenters, electricians, plumbers, and the like were building 150 houses per week. Over the next four years, they converted 4,000 acres of potato fields on Long Island, 50 miles outside Manhattan, into more than 17,400 houses divided into neighborhoods centered on landscaped shopping areas and playgrounds. Not only did the Levittown concept solve the housing crisis, but it also offered the chance for thousands of working- and lower-middle-class families to become homeowners, a status heretofore reserved for the higher-middle and upper class. While the construction method was an innovation, the idea of such whole-scale community design dates back to federal initiatives of the nineteenth century. Advocates of the Levittowns in New York, New Jersey, and Pennsylvania such as sociologist Herbert Gans applauded the social stability provided by creating safe, family-oriented environments available to the majority of Americans. Critics,

An aerial view of Levittown, New York, in 1954. (Library of Congress)

such as William H. Whyte and beat poet Gregory Corso, feared the emergence of the isolated nuclear family and despised the alleged cultural wasteland created by mindless consumerism and social conformity. Suburbia also became a target for environmentalists. The Sierra Club's early coffee-table book *This Is the American Earth* (1965) included aerial photographs of new subdivisions in Southern California as part of their critique of the loss of wilderness.

directly associated with urban sprawl and the socioeconomic gap that exists between suburban and urban residents. The growing income gap between urban and suburban areas has a significant influence on the amount of funding for public education, social services, and urban improvement. In addition, the expansive suburban housing tracts that surround city centers have led to the increased development of land, widespread construction, and growing amounts of automobile traffic and congestion. Increasing numbers of inner-city residents also choose to enter the suburbs when housing prices become affordable, making their new neighbors more amenable to flight to even more exclusive suburbs with members of their own socioeconomic or ethnic group. A more recent development worldwide has been a shift toward gated com-

munities, single-home housing developments surrounded by walls and manned by guards to provide a new sense of security and status to residents.

Suburbanization in the Western sense, however, does not explain developments in many areas of Europe, Latin America, or Asia, also shaped by the migratory patterns of elites to particular residential districts that are not specifically suburbs. In countries such as France, suburban communities (*banlieues*) are characterized by government-subsidized tower blocks, heavily populated by North African Muslim immigrants (largely from Algeria) and afflicted with high levels of crime and poverty, in contrast with the wealthy inner-city districts of French cities largely populated by indigenous French. Since the 1970s, gated communities for wealthy elites

have spread in Latin American cities. These gated communities, some of which remain in older inner-city neighborhoods, exemplify the socioeconomic segregation in modern metropolises such as Tijuana and Mexico City. Similarly, in China newer residential districts for elites, characterized by high-rise condominiums and adjacent shopping areas, contrast with the older working-class residential areas of an earlier period.

Urbanization since 1945

Urbanization refers to the increased extent of urban development within a given geographical area, such as a region or a country. It is a term that is often incorrectly used and thus is commonly, and mistakenly, referred to as being the same as urban growth, a term that more precisely relates to the rate at which an urban population or an urban area increases in a given period relative to its own size at the start of that period of time. Urbanization instead involves two fundamental aspects relating to urban development. The first is an increased urban proportion during a given time relative to its size at the start of the defined chronological period (e.g., a year or decade). The second major characteristic of urbanization is that it can be used to describe the proportion of total population or area in urban localities (such as towns and cities). Currently, most regions of the world have experienced urbanization to some degree. Presently, global urbanization rates are 1.8 percent. In comparison, rural population growth is just 0.1 percent.

Frequently there are different levels of urbanization between continents and between countries within continents. By way of example,

A view of Hong Kong's harbor from Victoria Peak. One of the world's most densely populated places, Hong Kong's more than seven million people are crammed into a total of about 420 square miles, almost all of which is highly developed and urban in character. (Corel)

Europe today has a high level of urban population but a slow urban growth rate (0.2 percent). This is an urban population percentage much higher than Africa (urban growth rate 4.9 percent per year) where large numbers of people still live in rural locations. Yet in Africa and other regions of the world, urbanization is increasing. The Indian subcontinent is expected to increase its urban population total in the next 20–30 years by tens of millions of people. Such increases are also expected in other parts of Asia as well as in Latin America (urbanization rate 3 percent) as governments encourage industrialization.

In many Asian countries (urban growth rate about 3.5 percent) as well as in African and Latin American countries, large numbers of rural dwellers are migrating to urban centers, with urban development in places such as China (urbanization rate 41 percent) important not only to economic growth but as an answer to an age-old problem: rural poverty. Hence, urbanization has been encouraged since the 1980s by the Chinese national government. Significantly, in wider terms, less developed economic regions of the world have in the past 50–60 years seen the greatest rate of urban growth, with the United Nations estimating that urban populations in developing regions rose from about 300 million in 1950 to 2.25 billion in 2005.

BRASILIA

Inaugurated on April 21, 1960, to be the new capital of Brazil, the city of Brasilia epitomizes both the achievements and the failures of twentieth-century modernization in that country. While the idea of moving the capital inland was present in the Brazilian constitution since the nineteenth century, it was only in 1955 that it became a reality when Juscelino Kubitschek was elected president. Under the overall theme of advancing “50 years in 5,” Kubitschek called for an urban design competition won by Lucio Costa (1902–1998). As explained by the competition jury, the winning entry had the best combination of a functional urbanism with the necessary monumentality of a capital city. The scheme by Costa was based on two wings of housing blocks (*superquadras*) for workers running north-south in subtle curvature, intercepted by an east-west axis that houses the majority of the federal bureaucracy. Architect Oscar Niemeyer (b. 1907) designed the main buildings in the so-called monumental axis, including the congress, the presidential palace, and the judiciary headquarters, as well as the ministries buildings, cathedral, and theater.

Criticized almost immediately after inauguration for being a desolate dystopia, Brasilia became a classic example of the failures of modern urbanism and the separation of housing, work, leisure, and transportation. Federal employees forced to move from around the country had little or no empathy

National Congress building in Brasilia, a planned city designed by Brazilian architect Oscar Niemeyer. (Corel)

with the wide-open spaces and the absence of street life to which they were accustomed.

However, as the city grew to its current 2.5 million inhabitants, a new generation became enchanted with the shaded green areas, the uncomplicated traffic, and the neighborhood amenities. The result was the gentrification of the *superquadras* (contrary to the utopian ideals of the original plan), forcing the majority of the working class to live in other settlements removed from the center, as in any other large Brazilian city.

—Fernando L. Lara

Irrespective of the location of urbanization, its effects can be extremely difficult to manage. These effects, sometimes devastating, can be economic, social, environmental, or psychological. As large numbers of low-skilled, low-educated migrants come into cities, the demand for satisfactory housing often outstrips supply. Moreover, traffic congestion in cities often ensues, adding to environmental ills. Urbanization also leads to a sociospatial fragmentation, increasing social tensions. Frequently, wealthier members of urban society flee to gated suburban enclaves.

Industrialization has been a major influence on national and global urbanization, leading to radical changes in many societies. These changes include the rise of manufacture, the decline of

the significance of agrarian labor and output, the rise of per capita income, a dramatic rise in national populations as a consequence of changing birth and death rates, a change in the composition of the urban hierarchy, the increased influence of these settlements over the hinterlands, the decline of traditional social structures, new urban lifestyles and attitudes, and the growth of slums and shanty towns where migrants live. It is estimated that in sub-Saharan Africa 70 percent of urban dwellers live in slums. In this light, industrialization and urbanization—often assumed to mutually underpin each other—create negative as well as positive elements, and urban designers, including the modernist architects Le Corbusier and Oscar Niemeyer, have

attempted to tame the two heads of industrialization by proposing entirely new urban places, such as Chandigarh (India) and Brasilia (Brazil).

Urban development affects not only the building industry but, significantly, may overwhelm governmental practices employed previously to safeguard the urban environment, as overcrowding, poverty, inadequate sanitation, and disease demonstrate. Ecological degradation can also arise, including air and water pollution, the loss of flora and fauna, and instability within local water and land ecosystems. To combat such problems, governments have begun to implement initiatives relating to sustainable development, a strategy supported globally by the United Nations and other organizations. In countries such as China, sustainable development has become a significant means to combat environmental, social, and economic problems surrounding industrialization and urbanization.

Urban Renewal, Post-1945

Urban renewal refers both to public policy and to a model of urbanism that followed World War II. As a public policy, urban renewal involves the redevelopment conducted by public authorities, alone or in partnership with private entities, of decaying areas in cities or metropolises. Areas targeted for renewal usually have been of high population density, with derelict urban infrastructure, poor housing conditions, a high proportion of low-income families, and, in some cases, a large proportion of ethnic minorities and immigrants. Initially, these were areas that have been most affected by the profound changes in the economy and in the social structure that occurred after 1945, including the decline of tradi-

tional industries and the move of more affluent populations from the neighborhoods around the central business district (CBD) to the suburbs, which had impacts on the local economy of the major urban centers and in the social composition of these communities.

As a model of urbanism, urban renewal stemmed initially from the modernist discourse of the Congrès Internationaux d'Architecture Moderne (CIAM), first convened in 1928 to reenvision and rationalize the city along modernist principles (or Modern Urbanism). Such principles remained popular in the post-1945 period up to around 1980, when the more humanistic principles of New Urbanism with its goals of preserving human-scaled and walkable neighborhoods began to replace the logical top-down approach inherent in CIAM and Modern Urbanism.

In Western industrialized countries, the first projects of large-scale urban renewal were implemented after the end of World War II. For example, in the United States, the first major urban renewal projects are linked to the Housing Act of 1949 and to the Eisenhower administration in the 1950s. In Europe, in those countries more affected by the war, the reconstruction of the major urban areas was conducted under the principles of Modern Urbanism and the Charter of Athens of the CIAM movement. By the 1960s and 1970s, the urban renewal model applied in Baltimore in the United States in the 1950s became a reference for urban renewal not only in North America but also in other parts of the world where variants of this model were implemented.

In practice, such urban renewal meant the destruction of old buildings and infrastructures and the relocation of residents and economic activities, affecting vast areas in the inner city. In these areas, older neighborhoods were replaced, in some cases, by high-rise buildings, including multifamily housing estates, and new and large transport infrastructures (such as freeways and trains), a process followed often by the gentrification of these neighborhoods. Urban renewal implied the displacement of low-income families, the decline of the private rental sector, and problems in providing social housing. In most of these cities, local business interests played a much more important role than local resident associations

► TEDDY CRUZ—SHANTY TOWNS AS IDEAL FOR NEW SUBURB

Born in Guatemala, Teddy Cruz is an architect who practices and teaches in southern California and is also the founder of the Border Institute. His work has always been focused on the turbulent relationship between San Diego, California, and Tijuana, Mexico. Among his most debated ideas is the proposal that Tijuana shanty towns should be an inspiration for contemporary urbanism. In his projects he acknowledges all the problems with unsecured tenure (land rights) and sanitary conditions in slums but moves on to argue that the process that generates shanty towns and some of its results should be perceived as assets rather than burdens. For instance, while traditional suburbs have the highest levels of consumerism and waste, shanty towns are built out of recycled materials, have more sustainable densities, and are much more creative and diverse in their formal arrangements. Cruz has documented how old tires are used as retaining walls and how metallic bungalows scheduled for demolition in southern California are being bought and transported across the border to Tijuana, where they are relocated on stilts to allow for parking underneath. The contrasts between San Diego and Tijuana make the case even more striking, for according to Cruz nowhere else are some of the wealthiest subdivisions of North America so close to some of the poorest slums of Latin America, separated only by a 10-foot-high metal wall. The presence of such a wall, says Cruz, makes San Diego the largest gated community on the planet. Nevertheless, he points out that 60 million people cross that specific border every year, transporting ideas and concepts as well as goods and services. Inspired by the energy he perceives in Tijuana, Cruz has been fighting to change San Diego's zoning law to make space for affordable housing.

—Fernando L. Lara

in the design and implementation and in sharing the benefits of renewal projects. Such projects were undertaken worldwide in areas such as the Darling Harbour area in Sydney and in Melbourne, Australia; Port Vell in Barcelona; the old port area in Osaka as well as in Kobe and Sakai also in Japan; Cairo in Egypt; Izmir in Turkey;

Kuwait City; Warsaw in Poland; Guatemala City and Buenos Aires in Latin America; and Cape Town in South Africa.

These interventions changed the face of inner cities in Western countries in a way that prompted strong reactions beginning in the early 1960s. Jane Jacobs in her influential 1961 book *The Death and Life of Great American Cities* mounted one of the first major critiques of the type of urbanism that privileged large-scale urban renewal. Indeed, the first generation of urban renewal projects have been controversial everywhere, not only among the most affected social groups but also among academics, independent observers, and political and human rights activists. Critiques also target the CIAM Charter of Athens' principles of functional specialization, with separated city zones for work and housing including the separation of social classes and the need for efficient transportation corridors and services. These critiques, along with the fiscal crisis of the 1970s, led gradually, in the 1980s, to new perspectives and methodologies for the regeneration of the older parts of the cities.

However, as with Modern Urbanism, the new approach is not a monolithic block, and different forms of intervention have been applied in different locales. Nevertheless, recent urban renewal projects tend to favor the redevelopment of existing communities; see the local population as the main asset; revitalize the central business district; involve only selective demolitions instead of wholesale renewal; use tax, fiscal, and administrative incentives to revitalize traditional activities; and, since the 1980s, give greater importance to cultural projects in urban regeneration, improving the local community's self-image and social cohesion. Such postmodern approaches enable local citizens to have greater control over and ownership of their houses and businesses and greater involvement with environmental and cultural issues.

Megacities

A megacity is widely acknowledged to consist of a metropolitan area that has a population in excess of ten million persons, but in reality often it consists of not just one but two or more metropolitan areas that have merged to form a major conurbation. One example would be the merging of Yokohama with Tokyo in Japan, with a resulting urban center with a population well in excess of 10 million persons. Where two or more metropolitan centers join together, the term “metroplex” is often used, yet other definitions of “megacity” are also known to exist, such as those that relate to both a large population size and high population density. In Canada, for instance, the term “megacity” is employed to note a large municipal area but may also include both urban and rural districts within a given municipal boundary. Since cities are acknowledged as the cultural and economic motors of nations, the significance of a megacity within its domestic context is not to be underestimated. The importance of these places is in part demonstrated by economic markets that are of continental and often global importance.

The first widely acknowledged megacity was New York, which reached a population of more than 10 million persons by about 1950. Currently there are more than 20 megacities that are widely dispersed throughout the world in North America, South America, Europe, Africa, and Asia. The largest megacities currently include Tokyo, Japan (at least 30 million people); Mexico

➤ LEARNING FROM LAGOS—AFRICA'S MEGACITIES WORK

While megacities globally are officially distinguished chiefly by their size, large African cities (and megacities of the global South more generally) are commonly attested an additional feature, that of dysfunctionality. More specifically, Africa's megacities are frequently portrayed as overurbanized because population growth outstrips economic growth and are also characterized by an absence of planning and control.

Lagos, Nigeria, is often perceived through this frame of dysfunction. As one of Africa's four megacities, Lagos has grown from a mere 300,000 in 1950 to an astounding 10 million in 2006. By 2015, the city's population is expected to reach 17 million. Over the past two decades, this unprecedented growth rate has yielded a dramatic deterioration of city infrastructure and services, worsening socioeconomic conditions for its inhabitants and leading to spiraling crime rates.

Yet some argue that if we only view Lagos (and the other African megacities) as an urban nightmare, then we miss a much more significant point. Indeed, a growing body of Africanist urban scholars is challenging the tendency to measure cities of the global South through models of the Western industrial city. New York-based architect Rem Koolhaas studied Lagos for eight years. He concludes that even though Lagos lacks planning and appears degraded, the existence of bottom-up self-organization processes among the city's residents creates an improvised functionality within the apparent chaos. In other words, the presence of an informal sector and the absence of large-scale planning interventions does not equate to dysfunctional urbanism. Thus, Koolhaas and others remind us that rather than researching what is wrong with Lagos, we should pay more attention to how it functions. Dynamism and creativity make megacities work. We can indeed learn from Lagos.

—Fatima Müller-Friedman

City, Mexico (about 23 million people); New York City, New York (more than 22 million people); Seoul, South Korea (22 million people); São Paulo, Brazil (20 million people); and Mumbai and New Delhi in India (each having a population of more than 19 million people). Two other

Congested street in Tokyo, Japan. Tokyo is Japan's capital and its largest city with roughly 12 million inhabitants. There are more than 30 million people in the greater Tokyo area. (Corel)

important megacities are Lagos, Nigeria, and Manila, Philippines.

While the first megacities appeared in nations of the developed world such as North America and Europe, in recent years megacities have appeared in other parts of the world, that is, in the developing world as a result of the onset of modern processes of industrialization that stimulate urban growth. China, for instance, stands as a strong example of a newly industrialized nation experiencing both rapid and large-scale growth within its urban centers. The resulting growth of Shanghai and Beijing has promoted them to megacity status.

Garbage

The amount of solid waste (or garbage) accumulating worldwide in rubbish dumps, landfills, and

disposal sites or being illegally dumped in oceans has grown exponentially since the end of World War II. Recycling programs are a viable method of decreasing waste, but they are inadequate to handle the rising deluge of disposal packaging, paper goods, plastics, and toiletries that have accompanied global consumerism. While it is mainly developed nations that are concerned with the effects on the local environment caused by disposal techniques (landfills leaking into the water table, incineration causing air pollution, illegal dumping), developing nations contend with the added issue of health consequences to impoverished people living amid garbage dump sites.

Following the end of World War II, increased global interactions and trade networks grew. The booming consumer market in much of the developed world (the United States, Western Europe, Australia, Japan, and Canada) established that greater profits could be generated via the production of inexpensive disposable goods rather than long-term durables. The packaging industry created its own niche by providing boxes and plastic and paper materials to protect and display these goods to enhance distribution and marketing. Increasing globalization has brought manufacture to outsourcing locations in the developing world, which offered inexpensive labor and new markets for goods. The consumerist ethos, consumer habits, and the rise of the plastics industry have added to the world's accumulating garbage. To give only one example, as of 2008, one consumer group estimated that 500 billion plastic bags were in use worldwide annually.

Typical waste disposal before World War II in much of the West was characterized by the municipal dump, which accumulated household garbage collected by municipal collectors, or incineration, which involves burning garbage whether at regional sites or even in individual apartment buildings. Scrap metal and other reusable materials typically were recycled, while other goods were left to decompose in the dump. Following the population boom of the 1950s, municipalities turned to the use of landfills (also known as middens), large disposal pits in which garbage is buried. The Fresno Municipal Sanitary Landfill, opened in 1937 in central California, was

the first modern sanitary landfill in the United States, utilizing the techniques of trenching, compacting, and the burying of waste with soil. Landfills have the potential of being reused and landscaped after being filled. However, seeping waste can and does pollute local groundwater supplies. Recognition of this problem led to demand for safer landfill techniques such as impermeable liners and fill. Nevertheless, landfills are still typically built in economically depressed rural areas, where they create an eyesore for the local community and offensive odors and can pollute local water sources.

In the developing world, the accumulation of garbage in open dumps in outlying areas near urban centers (e.g., Mexico City, São Paulo, and Beijing) are typically foraged by poverty-stricken indigents and their children who live in destitution and are subject to health hazards from these living conditions. Various urban areas in sub-Saharan Africa, Latin America, and South Asia, without the benefits of modern municipal trash collecting services, have large amounts of trash accumulating in their city streets. The developing world also suffers from the importation and unauthorized dumping of garbage, often toxic, from the developed world onto its soil. International demands for regulation of the international

Birds circle over large piles of garbage, seeking food at a landfill. Most cities in the United States are rapidly overflowing their landfill space, and some are having to meet the challenge by developing creative waste reduction strategies and incentives. (Photo Disc, Inc.)

➤ TOXIC WASTE—THE *KHIAN SEA* BARGE SAGA

The growth in the movement of hazardous wastes, particularly from wealthy industrialized countries that are exporting it to poorer developing countries, is of great concern. The tale of the barge *Khian Sea* is just one of many stories of dumping that illustrate the extent of this problem.

On September 5, 1986, the *Khian Sea* left the port of Philadelphia holding 14,000 tons of ash from an incinerator located in that city. The ash was the remains of incinerated municipal refuse containing arsenic, cadmium, lead, and dioxin, all considered harmful or toxic.

The barge sought a dumpsite and was subsequently turned away from the Bahamas, Bermuda, the Dominican Republic, Honduras, Netherlands Antilles, and Guinea-Bissau. After these initial rejections, the City of Philadelphia signed an agreement to send the ash to Panama. The Panamanian government refused permission to dump the cargo. After a series of voyages, in 2002 the ash returned home to Pennsylvania to be placed in the Mount Franklin reclamation landfill.

—Arthur Holst

garbage trade have resulted in an increase of illegal dumping into the world's oceans, abetting an ecological disaster with long-term ramifications.

Greater efforts in both the developed and the developing world by governments and regional municipalities at creating recycling programs, advocating lifestyle changes (sustainability) to prevent mass disposal of consumer goods, and the restriction of dumping illustrate a growing global awareness of the problems created by garbage disposal in an era characterized by mass disposable goods. Many creative solutions posed in the developed world (the United States, the European Union, Canada, and Japan) to handle garbage include the usage of landfills for the extraction of methane gas for electricity, the mulching of biodegradable waste for the creation of natural fertilizers in municipal compost heaps, and the funding of recycling facilities. In 2007, the San Francisco municipal government banned the use of plastic bags in grocery stores within the city to compel citizens to rely on canvas bags

and encourage a culture of sustainability. Similar efforts regarding unrecyclable items, such as plastic bottles and e-waste (electronic goods with metal pollutants) are increasingly widespread in many Western municipalities.

Society and Culture

The Cold War, Third World anticolonial movements, and globalization all have had an enormous impact on world cultures since World War II. In this period throughout the world, particularly in growing urban centers, regional folkways and artisanal production ceded more ground to mass culture. Mass culture implies a standardization of lifeways as people depend less on regional customs and become, for better or worse, global citizens. A key feature of this continuing postwar shift to mass culture was the rise of networking technologies, electronic media, and infrastructures encouraging global consumerism. This overarching trend stems from the faltering of socialism in this period and a widening embrace of the Western economic model, what some would also call the spread of Western hegemony. Yet beneath the apparent homogenization of economic structures and cultural forms is an ongoing struggle between the modern and the traditional. In addition, the heightened environmental awareness of recent decades has shifted the formula as advocates of green lifestyles combat with the call to consumer pleasures.

The emergence of the U.S. model of high consumerism post-1945 appears as the realization of the liberal dream. That dream insisted that science, technology, education, free markets, and, ideally, democracy will lead to progress, a world marked with abundance, innovation, and freedom, including freedom from want. With the collapse of the Soviet Union and the end of the Cold War, this model was reinforced and has been embraced to some degree even by the People's Republic of China (PRC). The consensus seems complete. Consumerism also enforces a notion of multicultural tolerance, as all creeds, colors, and ethnicities are of equal value as niche markets. Yet underlying this triumph of an emerging unitary world culture (with the Cold War "We Are All Berliners" morphing to a post-Cold War "We Are All Shoppers") remains a vision of ongoing class warfare and of a traditional social fabric damaged by ceaseless motion and social anomie. Global consumerism (or neoliberalism) can be regarded as a reigning thesis already conjuring up its antithesis in the form of global terrorism, with the new synthesis waiting in the wings still unknown.

The Cold War infiltrated world cultures in various ways. In the United States, the Civil Defense Agency, founded to protect the public from nuclear attack, encouraged a spate of backyard bomb shelter building that reached an absurd level with the 1959 announcement of a Florida couple that they would be spending their two-week honeymoon in their bomb shelter. Ongoing atomic bomb tests in Nevada were commemorated with a series of showgirls who posed as "Miss Atomic Bomb" and "Miss Atomic Blast" starting in 1953. Gallows humor and bravado

prevailed in these displays that would be more appropriate, perhaps, to new car sales. The Cold War had warping effects on societies both East and West. Intolerance for freethinking, if expressed far more significantly in the Soviet Bloc, also found its way to the United States in the postwar anticommunist witch-hunts and book bans. Both the United States and the Soviet Union attempted to prove that they best provided for their citizens, as highlighted in the Nixon-Khrushchev Kitchen Debate in Moscow in 1959. Standing in a model U.S. kitchen in Moscow built as part of an American National Exhibit, U.S. vice president Richard Nixon insisted that the United States better housed its citizens and offered them more cars, televisions, and radios. When Nixon also suggested that it was better to argue about “the relative merits of washing machines than the relative strength of rockets,” Khrushchev retorted that he believed that the United States was involved in both competitions.

In the high art realm, commonly treated as the centerpiece of culture, modernism resurged both as a critique of and an adjunct to the Cold War face-off. Soviet arts stagnated with the absolute embrace of social realism, which the West left behind after the 1930s. Magazines in the West showcased artists such as the abstract expressionist Jackson Pollock, whose frenzied abstract canvases suggested American individualism and creativity. Liberty Radio and Radio Free Europe, U.S. propaganda radio, broadcast American jazz to similar ends. New developments in jazz such as bebop and cool jazz showed a rejection of the past and a rebellious self-assertion of African American and romantic outsider identities. In architecture, modernism became a mass style, best reflected in the sleek geometric starkness of Mies van der Rohe’s skyscrapers and worst in the bleak and unadorned

Le Corbusier-influenced public housing projects of the postwar era. Such cheerless fare only slowly gave way to the exuberance and wit of postmodernism, with its pastiche of styles. Often with government aid, film production became a global culture industry, with film centers maintained throughout Western Europe, Eastern Europe, Russia, India, the Near East, and Japan as foci of national pride and proof of a nation’s cosmopolitanism.

Magazines in the West showcased artists such as the abstract expressionist Jackson Pollock, whose frenzied abstract canvases suggested American individualism and creativity. Liberty Radio and Radio Free Europe, U.S. propaganda radio, broadcast American jazz to similar ends.

If elites embraced the high arts vision of modernism and its avatars, such as Pollock, a middle- and low-brow taste for kitsch, folk art, and nostalgia developed as well. Dwight D. Eisenhower dabbled in watercolors and paint-by-numbers and admired the folk art of Grandma Moses, who painted nostalgic images of a rural past. Walt Disney’s Disneyland, opened in 1955, featured as its entryway a nostalgic Main Street, a sentimentalized rendering of a turn-of-the-century U.S. small town. In Africa, artists trained in Western techniques sought to revitalize vernacular traditions and mix these with Western techniques to forge a new nationalist vision. Middle-of-the-road venues such as Alfred Stieglitz’s “Family of Man” photography exhibition toured the world in the 1950s. Its photo-

graphic images, culled from images by professionals and amateurs, of people in everyday life around the world sought to undercut Cold War divisions and offer a unifying vision of humanity in elemental situations. The exhibit also subtly championed democratic institutions such as the United Nations to ease crises.

The Marshall Plan for Europe and the rebuilding of Japan encouraged American-style consumerism and economic infrastructure worldwide, including the expensive highway systems necessary for trucks and for the automobile culture, with its lure of individualism that was most thoroughly championed in the United States. Buying became a duty in the Cold War United States as returning soldiers married, had families, and purchased new homes in the new suburbs, waiting to be filled with household products.

Yet many of the children of suburbia in the 1960s began to question the consumerist dream. African Americans demanded their access to plenty and political power, the United States fought its protracted neo-imperialist war in Vietnam, and recreational hallucinogenic drugs began to be manufactured, distributed, and consumed. Witnessing and participating in such social unrest emboldened a critical vision. A counterculture developed in the United States in the 1960s, and its culture of protest spread to other nations such as Mexico, Japan, and Western and Eastern Europe. Many of the student radicals expressed their support of anticolonial struggles worldwide. Posters of revolutionaries such as Che Guevara and Native American warriors of the past such as Geronimo became potent symbols of resistance. Important social changes, including the women's rights movements, gay liberation movements, and environmentalism, were outgrowths of this culture of protest. Yet the increasingly radical protests ultimately were met with violent repression; much of the counterculture dissolved into the mainstream or helped create (and profit from) an alternative form of consumerism that reflected environmental and natural values. Advertising changed to reflect this youth-oriented consumerism, and new products including the Apple computer fueled counterculture dreams and corporate fortunes.

New communications and transportation infrastructure, including the container revolution, more closely interlinked international commerce. This encouraged the deregulation that allowed wealthy nations with advanced technological capabilities to deindustrialize and shift manufacture to the developing nations, with their pools of easily exploited labor. The power of labor unions was stretched thin. Critical voices first depicted globalization as the Coca-Colonization or McDonaldisation of the world as the United States imported and imposed its products and lifestyle. Yet in more recent decades it has become clear that globalization is a multilinked network. Teenagers in South Korea might listen to Japanese youths singing American-style rap music, while adults in Russia might watch Mexican television soap operas (*telenovelas*), and in South Korea gamers have become respected professionals akin to athletes in the United States. Images of Hello Kitty are licensed and marketed worldwide as one avatar of Japanese cute culture. Along the way, local community has both gained and suffered. While the loss of local

In postcommunist Eastern Europe, Ostalgie, or affection for the mass productions of the Soviet-era past, has aided sales of Kofola Cola in the Czech Republic, while in Hungary the communist-era Tsiza running shoes are again popular, as new consumers promote a local identity ironically anchored in the lost communist past.

community is often lamented, the problems associated with provincialism also have faded as computers, global positioning systems, and cable television create more and more global citizens.

Some resistance to globalization is absorbed as glocalization. In a crucial shift, for example, cuisine has not only globalized but glocalized, with fast foods such as rice-bun hamburgers in Japan and California roll sushi springing to existence in the United States. In postcommunist Eastern Europe, Ostalgie, or affection for the

mass productions of the Soviet-era past, has aided sales of Kofola Cola in the Czech Republic, while in Hungary the communist-era Tsiza running shoes are again popular, as new consumers promote a local identity ironically anchored in the lost communist past. Proponents of the local food movement position themselves much like the antimodernists of the turn of the twentieth century attempting to embrace handicrafts in a machine age yet with the added ammunition of a green ethic and the dangers of global warming.

The problems associated with globalization, including labor exploitation, environmental hazards, and global health epidemics, remain conspicuous. Glocalization aside, concerns about the development of a bland universal commercial culture have not dissipated. Experts who have studied the new frontier of space tourism, for example, suggest that the most likely activity for space tourists, if and when a space travel infrastructure is developed, will be shopping. Since the closing decades of the twentieth century, a new culture of protest has sprung up around yearly economic conferences, particularly those of the World Trade Organization and the World Bank. At the same time as environmentalists, trade unionists, and localists assail globalism, the triumph of Western consumerism remains in jeopardy; the same infrastructure that supports globalization has also aided the rise of global terrorism. The liberal dream with its valued individualism also has defied the creation of a unified belief system, as new subcultures, for example, coalesce around different Internet interest sites to promote, perhaps, the latest conspiracy theories.

—Fred Nadis

■ Introduction: Social Class Dynamics since 1945

Following World War II, the United States, Canada, Australia, and Western Europe experienced a period of economic prosperity in which large segments of these societies enjoyed greater social mobility. The GI Bill of

Rights, passed in 1944 in the United States, provided funding for veterans to attend college and allowed them to obtain low-interest government-backed mortgages to purchase homes, while state funding of postsecondary education in Western

Europe (particularly in those states that would eventually constitute the European Union) granted working and lower-middle-class Europeans social mobility. In addition, these states developed a welfare infrastructure that provided a measure of security for many citizens. However, the social mobility experienced by many whites was elusive for many people of color in the United States and the European Union. Authorized guest workers and undocumented workers in the United States, Europe, and the oil-wealthy Gulf states filled positions in the low-wage sector. Racial minorities in the United States not only were largely denied the opportunity to purchase housing in newly developed suburban neighborhoods, but urban renewal initiatives and the construction of highways to connect suburban whites to the cities destroyed many communities in which people of color were concentrated. The Oil Crisis of 1973, the decline in real wages in the United States and the European Union, the shift from an industrial to a service economy, and the more recent fiscal crisis spurred by the fall of the subprime mortgage market have exacerbated an already-existing economic gap and created an even more stark concentration of wealth among a small percentage of the population.

Post-Cold War developments in the undeveloped nations of the world had a different trajectory in terms of social class dynamics than in the global North. Deregulation, coupled with free market ideology and rapid globalization, often only offered economic gain to local elites in developing nations. The introduction of economic liberalization in current or former communist strongholds, notably China and Vietnam, has produced mixed results with regard to opportunities for social mobility. On the one hand, liberal reforms in China have produced a growing middle class of business owners and entrepreneurs that is expected to double by 2020. However, growing urbanization in Chinese society has also produced an urban underclass, while peasant farmers continue to occupy the lower rungs of the socioeconomic ladder. Meanwhile, the implementation of privatization (the selling of public holdings to the private sector) in Russia and other former Soviet republics has done little to transform the power structure within

these nations. Moreover, most citizens in the former Soviet Bloc nations, particularly those in rural communities, have fared worse in part because they relied upon the state to provide a source of income and livelihood.

Constitutional reform in postpartition India, including protections and programs for the lowest strata of Indian society (the *dalit*, or “untouchables”), have failed to dismantle the caste system, and the growth of a middle-class sector derived from the outsourcing of labor by U.S.-owned and other foreign corporations have merely perpetuated stratification in Indian society. Moreover, the wealth gap in Latin America, the Middle East, and Africa has also created a significant cleavage between business elites benefiting from extraction industries and the benefits of modernization, while the vast majority of the population remains mired in poverty amid the uncertainties of globalization.

—Josef Castañeda-Liles

Rise of Mass Education, Literacy, and the University

According to historian of higher education Martin Trow, following World War II the industrialized world underwent a transition from elite to mass and finally to universal higher education. In the first post-World War II decade, only 5 percent of Western European high school students and about 30 percent of American high school students entered college. By the 1960s, that number had risen to about 15 percent for most Western European nations and 50 percent for the United States. And while the numbers for the United States remained more or less stable since then, the number of high school students entering college in European states grew to 30 percent by the 1990s.

Today there are 1,959 universities in North America and 1,678 universities in Europe. Exact numbers are not available because of differences with regard to the definition of a university. In Germany, for instance, one can find universities, pedagogical colleges, technical universities, and Fachhochschulen, which prepare students for very specific professions. In the case of France, special schools, not universities, are charged with the task of training the elite. In the United States,

➤ HIGHER EDUCATION ENROLLMENT— A GLOBAL TREND, GLOBAL EXPLANATIONS

Along with the expansion of higher education institutions worldwide, the increase in higher education enrollment has been a universal trend during the twentieth century. Scholars have tended to explain this increase in postsecondary enrollment by focusing on national-level or regional-level factors (e.g., the impact of the GI Bill in the United States or the process of decolonization in Africa and Asia). But there may be global explanations for this trend. According to sociologists Evan Schofer and John W. Meyer, the rapid expansion of postsecondary enrollment worldwide, particularly after World War II, was due in part to a pervasive adoption of a new model of society that emphasized liberalization and development in which the production of human capital was essential for national economic expansion. The specific institutional and ideological changes that facilitated the expansion of postsecondary enrollment included greater democratization and the international acceptance of human rights, the expansion of science into various aspects of the social world, the implementation of national development plans, and the expansion and institutionalization of international nongovernmental organizations promoting democratization, science, and educational access while holding nation-states accountable to a world community. Schofer and Meyer find that all four factors contributed to the global increase in higher education enrollment throughout the twentieth century, particularly after the close of World War II.

Bibliography

Schofer, Evan, and John W. Meyer. "The Worldwide Expansion of Higher Education in the Twentieth Century." *American Sociological Review* 70(6) (2005): 898–920.

four-year colleges and universities that do not have the authority to grant doctoral degrees are always counted together with doctoral-granting universities.

Since 1945, the number of institutions of higher learning worldwide grew significantly. In the United States, it increased from 1,304 in 1945

to 1,893 in 2008. The Servicemen's Readjustment Act of 1944 (GI Bill) contributed much to the expansion of American higher education in the postwar era in the United States. With this legislation, the U.S. government provided financial assistance for those World War II veterans who sought a university degree. The GI Bill led to a tremendous increase of the student population in the United States, the founding of new campuses, and a widespread sense that higher education was an entitlement for all. The Higher Education Act (HEA) of 1965 established guidelines for the distribution of student aid by the government, while the 1972 HEA Reauthorization Act was of particularly high significance since it made for-profit educational organizations eligible to receive federally funded student aid. As a result, Pell Grant awards to students at for-profit institutions grew from 7 percent in 1973 to 26.6 percent in 1988.

In the 1950s, West German higher education, to take another example, was organized in six different types of institutions: universities, technical universities, colleges, theological colleges, colleges for artistic and musical education, and pedagogical colleges. There were a total of 154 such institutions with a total student population of about 133,000 students in West Germany. The majority of all students (60 percent) attended universities. By 1993, the number of institutions of higher learning had grown to 315 with a total student population of more than 1.875 million students. About 75 percent of all students attended universities.

In Africa and Asia, postsecondary education also expanded dramatically. At the beginning of the twentieth century, there were, according to Warren F. Ilchman and Alice Stone Ilchman, only 81 universities outside of Europe and North America. By 1985, this number had grown to 1,500 universities. More than 80 percent of these universities had been founded after 1945. The growth of universities was accompanied by a growth of student populations. In India, for example, university enrollment grew from 100,000 in 1947 to more than 4 million in the 1990s. Economic problems and social strife, however, have prevented many African countries from making significant advances in broadening access to higher education. While the student population

on the African continent increased from 21,000 in 1960 to 437,000 in 1983, it has stagnated since the 1990s. Further, there remain significant differences between various countries in Africa and Asia with regard to the development of the university system. While some countries pursue a policy of expansion, others maintain an exclusive and elitist postsecondary educational system.

At the end of the twentieth century, about 7 percent of high school students worldwide attended postsecondary educational institutions. And although globally women enter universities less frequently than men, they represent about 40 percent of the world's university population.

Class and Society in the Postwar United States

In spite of the growth of the welfare state under the New Deal and the massive economic expansion of World War II, class structure in the United States in the subsequent period was characterized by a growing economic gap and a social stratification increasingly determined by a person's race, gender, ethnicity, and occupational prestige. Between 1945 and 1990, the U.S. economy experienced a transition from an industrial to a postindustrial society as skilled and non-skilled manufacturing jobs flowed overseas to cheaper labor markets. The privileged upper and middle classes were better able to adjust to these structural changes, while those reliant on

THE POWER ELITE

Columbia University sociologist and social critic C. Wright Mills's influential work *The Power Elite* (1956) examined the way in which power in post-World War II America was organized and distributed disproportionately, favoring a cadre of a privileged few. Mills argued that the organization of American power is shared by three interrelated institutions: the corporate, military, and political elite.

According to Mills, business interests in the post-World War II United States had shifted their focus from local regional markets to national ones. While social background remained important, exceptional organizational skills became sought after as corporations expanded their markets. Through their national and international markets, corporate elites gained greater political influence. In addition, Mills points out that the relationship between the military and the corporation became increasingly close as military personnel freely crossed over to civilian employment, which in turn had a profound impact on the course of business.

As a result of the Cold War, military preparedness became an ongoing endeavor, leading to a permanent war economy. The war lords—Mills's name for the upper roosts of military power—gained an audience with politicians who wanted to be associated with military strength. Increasing government spending in military technology and education propelled the military ascendancy to unprecedented levels of power.

Mills claimed that many top positions in the executive branch were held by politicians who had close ties to the corporate and military worlds. Not attracted by the pay, many sought positions within the higher recesses of government so as to direct policy that would further benefit their class. The power elite was comprised of men who could effectively move from one circle to the other, usurping power into a concentrated ruling class far removed from the average American and the workings of a genuine democracy. His was a chilling analysis that had a great deal of influence on the New Left thinkers of the 1960s student counterculture.

—Jeffrey A. Hinton

industrial employment were hard-pressed to find work. Furthermore, the economic plight of inner-city residents, mostly people of color, worsened as city services lost their former tax base constituencies to the growing white suburbs.

Despite the civil rights movement of the 1950s and 1960s and other movements advocating rights for underprivileged groups, much of the ensuing legislation did not address the fundamental problems that exacerbated class (which were mostly associated with race) issues in American society. Marred by inadequate funding and facilities, the educational facilities in inner-city and rural communities failed to properly educate children of color. Increased poverty led to increased crime rates in many of these neighborhoods, often associated with gangs, drugs, and theft, further exacerbating these communities' social deterioration.

In the 1980s, the Reagan administration dismantled the War on Poverty programs of the 1960s and embraced deregulatory policies that encouraged the globalization of industries. Many of the existing federally funded economic safety nets were dismantled. Concurrently, the War on Drugs that began during the Reagan administration increased prison populations from lower-income groups. As the lower class was criminalized, art forms flourished that glorified the rebellious urban gangsta in rap music, graffiti art, and fashion. At the same time the media circulated images of yuppies, young urban professionals who celebrated a life of greed and luxury typified by gentrified neighborhoods and the number of limousines that began to appear on city streets. In the essay "Fortress Los Angeles," Mike Davis argued that in this period, the class divide was made visible in urban landscapes, as "architecture of paranoia" developed to separate the middle class from street life, whether in gated communities, shopping malls, the shrinkage of public space, or the increased criminalization of the poor.

Simultaneously, large numbers of immigrants, particularly from Latin America, entered the United States both legally and illegally, providing a pool of inexpensive labor and further depressing wages for unskilled and domestic employment. Many of these immigrants were relegated

to the bottom of the American class structure, as they lacked education and the ability to communicate in English and worked for subsistence wages. Many also worked illegally and off the books.

In contrast, large numbers of white ethnic Americans were able to establish relatively stable social and economic livelihoods following World War II. With long-standing social institutions such as university alumni societies, Rotary clubs, good old boy networks, and fraternities, many upper- to middle-class white Americans were granted opportunities not available to their less-privileged fellow working-class white and nonwhite citizens. However, large numbers of whites, particularly in economically depressed regions such as Appalachia and the declining Rust Belt, were subject to social and economic conditions similar to their fellow citizens of color. Informal hiring practices ensured that white workers would be a plurality in the job market, particularly in white-collar professions, further exacerbating the socioeconomic gap.

While the federal government instituted Affirmative Action programs beginning in the 1960s to ensure admission of nonwhite ethnic groups and women to higher education or access to employment, these quotas did not completely alleviate the structural socioeconomic problems of inequality in American society. However, in spite of such unequal distribution of opportunities and wealth, many women and individuals from nonwhite communities were able to move up the social ladder and establish patterns and institutions for economic improvement for others to follow.

The War on Poverty

By the time President Lyndon B. Johnson first proclaimed the War on Poverty in his State of the Union address in January 8, 1964, the urgency to enact an antipoverty campaign resonated among the American public with the popularity of such studies as Michael Harrington's *The Other America* (1962), John K. Galbraith's *The Affluent Society* (1957), Gunnar Myrdal's *An American Dilemma* (1944), and the contentious culture of poverty perspective proposed by Oscar Lewis (1959). Whereas Harrington and Galbraith discussed the effects of market capitalism on social inequality and Myrdal outlined the contradictions between American liberalism and the state of black Americans in the 1940s, Lewis asserted that the poor remain poor because this group adapts to the conditions of poverty and gradually absorbs values that reinforce their own marginality. These studies, particularly Lewis's, together with the longstanding drive from University of Chicago social scientists to work with communities, formed the intellectual background for Johnson's War on Poverty.

The specific details of Johnson's plan were made public in a special message to the Congress when the president proposed the program's centerpiece, the Economic Opportunity Act (EOA) of 1964. Emerging in tandem with Johnson's groundbreaking civil rights legislation, this legislation captured many of the concerns outlined earlier: community revitalization, expansion of educational opportunities, investment and a federal incentive package, and the creation of job training programs for 200,000 young Americans and work study for another 140,000. At first, the Johnson antipoverty agenda called for a comprehensive tax cut to help stimulate economic expansion. This fiscal initiative was followed shortly thereafter by a number of programs such as Job Corps and Head Start, designed to transfer marketable skill training and expand educational opportunities for the poor. More controversial still were the directly funded Community Action Programs (CAPS), which sought the direct participation of members of poor communities.

On the education front, Johnson's Great Society, of which the War on Poverty was a part,

enacted some 60 separate bills intended to improve educational opportunities for minority students by providing access to public schools and financing higher education with federal grants, low-interest student loans, and minority scholarships. One of Johnson's most controversial attempts to expand educational opportunities was the Affirmative Action program. This program encouraged higher educational institutions to consider race among the qualifications for admissions. The rationale was that since poverty and racial discrimination had deprived minorities of a fair chance to attain a college education

in the past, the lagging effects of this inequity should be taken into account during admissions to remedy this injustice.

Another radical component of the War on Poverty was the drastic expansion of public works projects, particularly construction. Johnson also created New Deal-styled programs such as the Job Corps to curtail unemployment. Great Society programs also gave rise to an unprecedented expansion of the federal government as new departments such as Housing and Urban Development (HUD) were created. Other existing bureaus such as the Transportation Department experienced extensive growth.

The funding for the War on Poverty was scaled back as the Johnson administration escalated U.S. military involvement in Vietnam. The economy could not accommodate two fronts. By 1967, giving in to intense criticism, Johnson folded the Office of Economic Opportunity yet reassembled many programs under different bureaucracies. By the 1980s, during the Reagan administration, consensus developed that the War on Poverty had been a failure. Critics from the Right, particularly Charles Murray in *Losing Ground* (1984) and economist Milton Friedman, argued that government social spending programs had long-term adverse effects on the economy and the moral fabric of the nation, as they not only were costly but also undermined personal responsibility and the drive to excel.

Yet other scholars point to successes of the War on Poverty, including statistics that suggest that programs such as food stamps and increased funding for Aid to Families with Dependent Children (AFDC), begun during Franklin Roosevelt's New Deal, strongly decreased the percentage of the population under the poverty line between 1959 and 1968. Other initiatives stemming from the Kennedy and Johnson anti-poverty programs such as Head Start (for preschoolers), Upward Bound (to help high school students prepare for college), VISTA (Volunteers in Service to America), and legal services continue to have their champions. Even many of the Community Action Programs that were the maligned centerpiece of the War on Poverty still remain, with government funding shared with corporate and other private sponsors.

The shift in esteem held toward these programs is evident in the enactment of the 1996 Personal Responsibility and Work Opportunity Reconciliation Act signed by President Bill Clinton. President Clinton embraced the rhetoric of personal responsibility popular among conservative critics of government social services and dismantled the AFDC while offering temporary assistance instead to needy families who met income restrictions, thus championing the conservative welfare to work approach to poverty.

Class Structure in Post-Soviet Russia, Eastern Europe, and Central Asia

Class structure in the post-Soviet world of Russia, Eastern Europe, and Central Asia has myriad similarities with that of the defunct Soviet Union. After 1991 the old Soviet elites of the party, the bureaucracy, and the military generally maintained their power in the new republics, while the mass of the multiple nationalities accommodated themselves, somewhat hesitantly, to the new political and economic arrangements. The initial enthusiastic reception of capitalism, liberalism, and nationalism quickly waned as the dissolution of the old Soviet power structure through privatization and the redistribution of

resources among the republics created social and economic chaos. Within a few years Russia asserted its economic and political hegemony, and new social problems were characterized by the increasing wealth gap between the masses and the new elites under capitalism, which were in fact the old Soviet elites with even greater political and economic clout.

The devolution of the Soviet Union to the Russian Federation replaced the socialist edifice with rampant privatization that benefited ex-Soviet functionaries without leaving much to the average Russian. The Soviet *nonmenklatura*, which consisted of Communist Party members, government functionaries, and bureaucrats, was responsible for administering the state, the economy, and industry. As a result, they were well placed in their positions to take advantage of privatization to accrue state industries when they went up for sale. The resulting kleptocracy, created out of the chaos of Soviet collapse, gained virtual control of the Russian economy. In contrast, the majority of the Russian people were exposed to the traumatic situation of adapting to capitalism in such a short period. The ruinous inflation and economic collapse of the Russian economy as it adapted itself to attract foreign investment through inflationary policies often hurt the average Russian. People who had previously survived on an assured living wage or a pension provided by the Soviet state found themselves destitute.

The chaos of the post-Soviet era and the growing gap between the newly rich ex-Soviet bureaucrats and the average Russian created the ideal environment for surviving crime cartels based on prostitution, extortion, and other black market practices to flourish, creating a wealthy criminal class. In this same period, hardships heightened for people from outlying areas of the defunct Soviet Union that remained on the margins of society due to the ethnic and religious characteristics that separate them from the Russian Orthodox general population.

Most of the newly emancipated East European republics suffered symptoms similar to Russia in the immediate post-Soviet era. Former technocrats of the communist regimes found themselves in a position to take advantage of rapid privatization and bought up state indus-

➤ DEDOVSCHCHINA IN THE POST-SOVIET MILITARY

In post-Soviet Russia, the retention of conscription across all social classes maintains the institutional Soviet Army as a model for diluting social differences among soldiers. The issue of *dedovschchina*, a form of hazing of new conscripted recruits, still plagues the Russian military, as hundreds of soldiers are estimated to die yearly due to issues of hazing, humiliations, privations, and brutal beatings bordering on torture. Class differences in the ranks have led many lower-class soldiers to haze their economically better-off comrades with the pretext of toughening them up for the vagaries of the life of a soldier. The brutalization of Russian recruits exposed to harsh living and working conditions for multiple years under conscription characterizes the problems created by *dedovschchina* in the military establishment.

The resulting deaths and the psychological and physical damage of recruits have created much consternation among the Russian public and government. Since the end of the Soviet Union, the Russian government has promised to reform the military to remove this vestige of the late Soviet Army. Yet *dedovschchina* continues to be a problem among the ranks, contributing to high levels of suicide, various psychological disorders, and brutal acts of retribution during combat, such as in the war in Chechnya by Russian soldiers.

—Abraham O. Mendoza

tries in order to enrich themselves. The adaptation to capitalism hurt rural communities much more than urban areas because the rural regions had depended on assured government markets rather than the now open market. More cosmopolitan urbanites quickly adapted to Western trends but also suffered privations as the economies underwent crash capitalism.

The Central Asian republics had an entirely different situation in the post-Soviet era. While they did have to adapt to the new economic and political situation, they also reemerged with a sense of national identity imbued with fervent nationalism created by the establishment of various republics with primarily Islamic cultural affinities. In the Soviet era this aspect of their ethnic characteristics had been suppressed and

subsumed under a Soviet identity. The power elite who had benefited under the Soviet Union, mostly local Soviet officials, again emerged as the leadership elite after the devolution of the Soviet Union. The gap that existed between urban Russophiles and rural regionalists created a vast class difference in the newly established republics. The secular-minded urban middle class wished to create for itself a more European identity, while the poorer rural classes sought to distinguish themselves as culturally Islamic and create linkages with the Middle East.

Changing Class Structure in Post-Maoist China

When Mao Zedong, the paramount leader of China for nearly 30 years, died in 1976, China was a society that consisted of two distinctive social classes: the workers and peasants. At the same time, only a small number of intellectuals served as a separate social stratum. Peasants made up 80 percent of the total population. The middle class or property-owning groups were wiped out when Mao came to power. Since Mao's death, China has undergone a radical social transformation thanks to the market-oriented economic reform launched by Deng Xiaoping in 1978. Amid the massive economic restructuring, new social classes have emerged, and social mobility has increased. Privatization, industrialization, and improvement in educational opportunities are the major forces behind these changes.

China was once a planned economy with the state and rural collectives controlling all resource allocation, production, and distribution. The gradual privatization of state sectors and the dramatic reduction in state control over economic activities have opened doors for private entrepreneurship and economic freedom. The private sectors expanded rapidly. Following Deng's restructuring, many people became self-employed or owners of private firms and factories. In 2006, there were more than 11 million private business owners. They employed more than nearly 70 million employees and controlled nearly 7 trillion yuan assets (about 1 trillion U.S. dollars).

Economic growth and rapid industrialization accelerated the urbanization process. More than 140 million rural laborers have left their farmland and become wage earners in urban areas. Urban laborers have increased diversity in terms of occupation, employment, and background. More than 40 percent of the urban industrial workforces are made up of workers who still hold a rural household registration in a system that is commonly known as *hukou*, which registers people by their residency. Three decades ago, most workers were employed by state sectors. Today, most work in the private and other nonstate sectors. In addition to industrial work-

➤ RURAL FAMILIES IN CHINA

More and more rural farmers in China, especially young couples, have moved to urban areas to seek employment. They have left behind their children due to the continued restriction of the household registration system (which ties the government's social welfare benefits with people's place of residency) or because they may not have enough time or resources to raise them in the cities. Some estimate that as of 2007, there were more than 20 million children in rural areas cared for by grandparents or relatives. This has caused many psychological and behavior problems for many of those children who do not have a normal family life and may have some negative long-term social impact if the government does not respond to the issue soon.

—Baogang Guo

places, another emerging segment of workforce employment is in the service industries, including banking, insurance, real estate, hotels, restaurants, tourism, taxis, and cleaning.

The peasant class has also undergone rapid changes. Although the percentage of peasants engaging in farming has declined sharply, the absolute number of peasants engaging in agricultural production continues to rise. It is expected that another 200 million from this background will be absorbed by urban expansion in the next two decades. For those who stay behind, their income will continue to lag behind that of urban residents. As a result, one of four peasants has to make money from nonfarming activities such as business, processing, and transportation.

One notable change is the emergence of various white-collar social strata thanks to the rapid expansion of public and private education systems. The large educated workforce pool has contributed to the growth of the knowledge-based economy. The new strata include new government civil servants, business managers, and college-trained professionals and intellectuals who by 2007 made up about 12 percent of the workforce. Together with many of the private business entrepreneurs, about 20 percent of Chinese may be classified as the middle class in 2007. This number is expected to double by 2020.

However, market reform also has had a negative impact. At the bottom of the social pyramid, there exists a new social underclass, namely the urban poor. This includes unemployed school graduates, laid-off workers, part-time or day laborers, a sizable number of jobless rural migrant laborers, some of the elderly population, farmers who lost their farmland due to urban sprawl, and disadvantaged groups such as the disabled or those in poor health, all of whom make up about 10 percent of urban population.

Class and Caste in India since 1945

The caste system is the complex system of social divisions that still exists in present-day India. Caste is an ancient hereditary system that developed from Hinduism, organizing all members of the society into groups with specific social roles. A person's caste determines who one can marry, specifies what sort of employment he or she is permitted, and even controls what he or she can eat or touch. Given that the majority of the people in India are Hindu, the caste system has played an influential role in the history of India. However, since Indian independence from Britain (1947), constitutional reforms and egalitarian ideology stemming from secularist and socialist political factions, in addition to substantial economic development, have significantly challenged traditional Indian conceptions regarding the caste system.

The Hindu concept of *varnashramadharma* refers to the system of classes of social life and stages of individual life in Hinduism. Hindus are divided among four *varna* (meaning arrangement in the context of social hierarchies) and a fifth group, known as the untouchables. The four major *varna* are the *Brahmans* (intellectuals and professional class), the *Kshatriya* (military and political class), the *Vaishya* (laboring class), and the *Sudra* (servant class). Below the

CASTE AND POLITICS—AFFIRMATIVE ACTION LEGISLATION IN INDIA

In contemporary Indian law, the term “reservation” refers to a form of affirmative action designed to aid the socially disadvantaged castes of Indian citizens, legally defined as the Scheduled Castes and Scheduled Tribes (specifically the Sudras and the untouchables). The reservation statutes require that a percentage of positions are reserved in the Parliament of India, individual state legislative assemblies, the civil services, and public educational institutions, where otherwise disadvantaged castes would be inadequately represented.

Following India’s independence from Britain in 1947, the new Indian constitution specifically prohibited any discrimination based on religion, race, caste, sex, and place of birth. While this provided equal opportunity for all Indian citizens, the constitution also included clauses to ensure reservation “for the advancement of any socially and educationally backward classes of citizens or for the Scheduled Castes and the Scheduled Tribes.” While this system has allowed a percentage of lower-caste individuals to advance in Indian society, it has yet to address the widespread socioeconomic inequities that exist due to the caste system. However, critics of this system allege that it is a form of reverse discrimination against the higher castes within Indian society.

—Abraham O. Mendoza

Sudra are the untouchables, who are believed to be impure from birth and are assigned employment in positions assumed to pollute the higher classes. Such positions include working with corpses and dead animals and cleaning sewage. As such, the untouchables are deemed as a lower social and economic class apart from the rest of Indian society. Each of the varna is divided into *jati* (birth) or kinship groups with hereditary social roles and specific professions preordained within Indian society by their respective varna. According to tradition, Hindus will marry only within their own *jati*.

Following Indian independence from Britain in 1947, increased globalization and technological advances have allowed for the creation of more diverse and specialized employment, com-

plicating how new professions fit within the existing *varna* system. In addition, political factions strongly influenced by Western ideologies such as Marxism and liberalism helped institute reforms to redress the social hierarchy of modern India and allow for greater egalitarian inclusion of the lower castes in Indian society. As a result, the Indian constitution has been modified to officially outlaw caste-based discrimination. In addition, the concept of untouchables was formally outlawed by the Constitution of India in 1950, and subsequently the caste was henceforth collectively referred to as *Dalits*, a more politically correct term (while Gandhi suggested using the term “Harijan,” meaning “Children of God”). A significant number of non-Hindu Dalits adhere to religions (Christianity, Buddhism, and Islam) that have historically politically agitated against the Hindu majority for legal provisions granting all Dalits greater opportunities within the Indian state.

This ancient social system has provided widespread stability in Indian culture and society; accordingly, many Hindus have been reluctant to reject traditional prohibitions and restrictions. However, the caste system has kept a large part of the Indian population in a condition of servitude and has restricted social mobility, placing it out of phase with modern ideologies. The prospect of greater egalitarianism continues to complicate Indian politics and society, as some traditionalist Hindus resist the prospect of change, while non-Hindus and Hindu Dalits agitate for equal opportunity.

Class Structure in Latin America, 1945–Present

After World War II, industrial growth, larger cities, and agricultural commercialization brought changes to Latin America’s social makeup and

the relative sizes of the socioeconomic classes. Large landowners adopted capitalistic practices and replaced the old *latifundista* (elite hacienda owners, or *hacendados*). Many of the new *latifundistas* who replaced the *hacendados* were college-educated and well traveled. They combined agricultural business with industrial and financial entrepreneurship. Above all, they were just as capricious and avaricious as the old *hacendados*. An industrial and financial middle class also appeared, with strong links to foreign investors. An overlapping group known as the urban middle sector expanded rapidly. Also, a small yet combative industrial working class emerged.

As a response to mounting foreign debt, international lending agencies required Latin American nations to reduce social welfare programs and privatize or eliminate many state-run activities. Most Latin American governments implemented neoliberal fiscal policies. These budget-slashing mandates resulted in rising unemployment and poverty among the middle and working classes. While benefiting multinational corporations and their regional partners, neoliberalism reduced the number and role of small and medium-sized industrial firms.

In the second half of the twentieth century, North American and European capital was attracted to the rapidly burgeoning market in South America and Mexico. With vastly greater financial resources and superior technology, foreign corporations bought out hundreds of locally owned companies. They thus gained control of important sectors of the host nations' economy. Realizing that a prosperous middle class or bourgeoisie was crucial to their own survival, these foreign corporations cultivated friendly bonds with the largest national businesses, mainly through hybrid companies. Thus, the new Latin American bourgeoisie, tied to global capital, showed little interest in nationalism.

Meanwhile, the urban middle sectors straddled the class boundary between two groups. On one side were the landowning elite and the new bourgeoisie. On the other side were the industrial working class and the peasantry. The urban middle sectors included affluent business managers who could be considered part of the new bourgeoisie as well as retail employees and

➤ THE INFORMAL SECTOR

Throughout the second half of the twentieth century, the informal sector was Latin America's largest class. It emerged because industry could employ only a fraction of the workforce. The informal sector included countless underpaid domestic servants, street vendors, persons who offered to watch and clean cars, tattooists, shoe and boot polishers, lottery ticket hawkers, prostitutes, pimps, illicit drug dealers, and beggars. Sociologists and economists estimate that by the end of the century, more than half of all Latin Americans were part of the informal sector.

Passengers aboard Mexico City's Metro train can expect to see the informal sector in action. During the 30–45 seconds that it takes for the train to travel from one subway station to the next, travelers may be entertained by a musician or contortionist in search of tips. On the next passage, they may encounter a teenager peddling pencils, rulers, or counterfeit DVDs and CDs.

All members of the informal sector have two things in common: they are self-employed, and their work is both irregular and perilous. By its very existence, the informal sector serves as a reminder that neoliberal economic policies have had a detrimental effect on a vast segment of Latin America's population.

—Jeffrey Lucas

low-level civil servants who earned less than skilled laborers. The urban intermediate sectors also included shop owners, independent craftspeople, and white-collar workers. With urbanization and the proliferation of commercial markets, the number of bureaucrats mushroomed. Before the 1990s, public servants comprised roughly 20 percent of Latin America's population. The number diminished after 1990 due to neoliberal cutbacks.

The peasantry—that is, small landowners, tenant farmers, and landless rural workers—experienced economic crisis with the advent of the new *latifundio* (or agribusiness). Agricultural mechanization, which had begun in the early twentieth century, proliferated after World War II and replaced millions of farm laborers. The lifting of trade restrictions meant that Latin

American farmers had to compete with foreign grain producers. Under these conditions, small farmers struggled to survive. At the same time, neoliberalism negated land reform laws. In Mexico and several other countries, constitutional protection of indigenous community property was amended, enabling speculators to purchase large tracts of land from rural villages. Consequently, an increasing number of peasants moved to the cities or immigrated to the United States in search of employment. These intranational and transnational movements were driven by low standards of living. Near the end of the twentieth century, Mexican financial experts estimated that two-thirds of rural families were profoundly poor, that is, unable to acquire the basic necessities.

With the spread of capitalism came the growth of an industrial working class. Factory laborers and mineworkers were better organized than any other faction. However, artisans made up the largest group. Artisan shop dynamics were characterized by paternalism and one-on-one bargaining. The prevalence of this type of working environment hampered the development of a strong and articulate labor movement.

Class Structure in Western Europe, Post-1945

Class structure in postwar Western Europe was defined by the European economic miracle that lasted until 1973, after which high unemploy-

ment and inflation exacerbated class antagonisms as reflected in politics and society. The so-called economic miracle began with postwar reconstruction under the Marshall Plan and the formation of the European Community (European Union after 1992) that ensured that Britain, France, West Germany, Italy, Belgium, the Netherlands, and Luxembourg developed prosperous economies with improved standards of living for their respective citizenries. A more equitable distribution of wealth, better educational facilities, an increased number of university graduates, and near full employment for three decades decreased the friction between European social classes.

During the period of the economic miracle, political compromises first born out of wartime cooperation kept at bay class antagonisms between the working class and the middle class. For example, in Britain the creation of the welfare state, which ensured the well-being of all its citizens by provisions of health services and unemployment insurance, was created by such a political compromise between the social classes. Throughout much of the early 1950s to the late 1960s, France, Italy, and Germany also had center-right coalition governments that ensured that the working classes made suitable living wages by advocating labor-management cooperation. West European governments also poured money into primary, secondary, and higher education. Education allowed children of the lower middle class and working classes to advance up the social and economic ladder. University education created an educated workforce to fill newly developing professions that necessitated specialized skills in management, finance, and government.

As native Europeans were able to increase their social and economic standing, non-European guest workers were brought in to fill the jobs that they had left behind. Britain invited West Indians and South Asians, France brought in Algerians, and West Germany invited Turks all as guest workers to fill nonskilled manufacturing and service trades. Most settled in housing projects near their places of employment, isolated from greater society. Poor living and working conditions and low pay characterized the plight of guest workers. While they did make consider-

▶ EUROPE'S TRANSNATIONAL COMMUNITIES

Major European cities in the postwar era have developed into multicultural urban areas characterized by distinctive ethnic neighborhoods composed primarily of nonindigenous nationals. These neighborhoods developed as the influx of guest workers flocked to areas that already had been settled by fellow nationals, following transnational support networks. As immigration continued and guest workers married and had children, the ethnic populations in European cities vastly increased in size. London has several South Asian (Southall, Tower Hamlets, and Newhall) and West Indian neighborhoods (Croydon, Lambeth, and Newhall), among others. Paris has various Algerian and Moroccan ethnic suburbs. In particular, Germany has the largest population of Turks outside of Turkey, with most residing in Greater Berlin.

While ethnic enclaves in European cities are not new, the fact that most of these communities are of non-European extraction is a new development. Strained relationships exist between the greater society and the non-European ethnic populations. Unemployment, growing crime rates, and terrorism are increasingly blamed on ethnic minorities. Incidents such as the Brixton Riots in London

View of the Turkish neighborhood of Kreuzberg in Berlin, Germany, where ethnic differences are evident. (Kristina Musholt)

by British Blacks (1981) and widespread riots in France in 2005 by French North Africans illustrate how the frustration due to economic and social marginalization may lead to increased social frictions in European cities.

—Abraham O. Mendoza

ably more money than in their countries of origin, they suffered social marginalization and discrimination due to their religious, racial, and ethnic differences.

The 1973 Oil Crisis ended the economic prosperity that Europe had enjoyed since the end of World War II, creating economic hardships and class antagonisms. Unemployment, wage cuts, and inflation severely affected the livelihood of many West Europeans. The working and middle classes suffered privations, as many of them were thrown out of work or contended with rising inflation. Guest workers, at the bottom of society, suffered the most, as they were the first to be laid off and were also blamed for the lack of employment opportunities for indigenous Euro-

peans. The gradual deterioration of the welfare state in subsequent decades, which led to increased hardships for guest workers seeking citizenship in addition to growing antagonism against ethnic minorities, characterizes contemporary European class relationships.

■ Introduction: Gender and Sexuality

The struggle for gender equality encompasses challenges to a variety of social, political, and economic inequalities based on gender identity. These struggles include more than just the inequities between men and women and the renegotiation of masculinity and femininity. Individuals who identify as part of the lesbian, gay, bisexual, transgender, and queer/questioning (LGBTQ) community challenge the discrimination they face based on gender performance, sexual orientation, and physical characteristics.

Increased attention to inequalities in education, labor, and marriage and family structures have been analyzed by scholars as important components of gender equality struggles. In fact, a quick analysis of educational opportunities is a primary means of determining whether a society is promoting equality between men and women. In 2001 the United States declared a War on Terrorism and promoted the notion that women in Afghanistan needed saving from the rule of the Taliban. Emphasizing how women and young girls were denied an education, the George W. Bush administration heralded educational inequalities as central to Afghani women's victimization. Some transnational feminists have argued that this kind of discourse homogenized Muslim women and ignored other important issues that need to be addressed, effectively placing the West as superior and further marginalizing women in Afghanistan.

Labor has also served as a benchmark for determining gender equality. The jobs available to men and women as well as the wages garnered can illuminate the role that gender plays in employment opportunities. Scholars note that women are often placed in lower-paying undervalued jobs. This is in part due to the historical legacy of situating men as the primary income earner, while women were to labor in the home. The majority of jobs in care labor, such as nursing and childcare, are held by women and seen as an extension of gender norms that promote women as naturally caring, nurturing, and compassionate. A consequence of this essentialization is lower wages for work that is argued to

match innate features of womanhood. In addition, feminized labor such as care work makes it difficult for men to enter into such professions, as it is seen as emasculating labor.

The home as a gendered site of labor is complicated by social and cultural family structures. Notions of traditional family structures privilege heterosexual unions over homosexual ones. From the latter part of the twentieth century to the present, gays and lesbians have fought for the right to adopt and marry. In the United States both issues are decided upon by the state, with federal laws not granting gays and lesbians the same rights as heterosexual couples. The struggle for gender equality is complicated by differing laws and cultural attitudes worldwide. For example, Canada, Belgium, and the Netherlands are countries where gay marriage is legal; this becomes controversial when couples cross national borders and their status is no longer recognized.

Multiple social movements and activists have confronted gender inequalities, but depending on geographical, historical, and cultural contexts the challenges vary. Levels of inequality are further complicated by intersectional forms of identity such as race, class, sexuality, age, and religion. Therefore, different approaches are necessary when dealing with issues such as women's roles in Islamic societies, transgender issues, the role of sexual identity, and the formation of masculinity and femininity. This has led to an emergence of different feminist, gay and lesbian, and men's movements throughout the world.

—*Janiene Langford*

Feminism in Global Perspective

It is nearly impossible today to speak of one feminist movement. In actuality, feminism has been fragmented along different ideological or theoretical lines throughout its history. Third-wave feminist ideology and its insistence on the recognition of different categories and possibilities of oppression have led to a vast variety of feminisms. The majority of these new groups began with the alienation felt by many women in what was seen as a primarily white middle-class

➤ FEMALE CIRCUMCISION

Female circumcision, sometimes referred to as female genital mutilation or female genital cutting, is a sociocultural practice originating in Africa that is performed on girls as an initiation rite into womanhood, among other reasons. The World Health Organization (WHO) has described this practice as the partial or total removal of the external female genitalia or other injury to the female organs. Female circumcision is traced as far back as the second century CE.

According to the WHO, between 100 million and 140 million girls have undergone female circumcision worldwide. Although female circumcision is prevalent in Africa, where it occurs in approximately 28 countries, it occurs in many countries and regions elsewhere, including Arabia, Asia, France, England, Australia, and the United States. However, it is not practiced in all African communities. Types of circumcision differ from community to community in each country. While statistics vary, the percentage of such procedures is as high as 90 percent in some communities.

To understand any form of circumcision, one needs to understand beliefs and attitudes toward sexuality in the circumcising community. This is because while sexuality is generally associated with biology, like gender, it determines social behavior and is often used as an instrument of social organization. In many societies sexuality is viewed as a disruptive force, which ought to be controlled in order to maintain social harmony.

Because sexuality defines human behavior, feminist theories of sexuality tend to locate it

within power dynamics of gender inequality. Feminists and human rights activists view the cultural practice of female circumcision as a violation of women's basic rights to good health, bodily integrity, freedom from torture, and self-determination and as a form of social control, sanctioned by a patriarchal society.

Health risks include injury, hemorrhage, infections, prolonged child labor, infertility, inability to experience sexual pleasure, and sometimes death, a violation of Article 5 of the Universal Declaration of Human Rights, which cautions against the subjection of anyone to torture or cruel and inhuman or degrading treatment. Female circumcision continues to attract international protests because of these risks. Where public policies against the practice have been instituted, the practice appears to decline. Yet the persistence of this practice in a number of communities where the practice is banned is indicative of how deeply rooted and complex the practice is and how difficult it is to transform attitudes.

women's movement. Others took shape independently as the former European colonies in Asia and Africa gained independence in the aftermath of World War II. While there is no strict agreement among these many diverse groups about the experience of oppression, there has increasingly been recognition of the multiplicity of this experience.

Histories of Third World feminist movements have been overshadowed to a large degree by the dominance of the Western model of a movement based on separate and distinct waves. Although this is the most common classification

of feminism, these divisions do not apply to women's movements in Asia, Africa, or Latin America. Often seen as part of the third wave, Third World feminism has developed along radically different lines, and women in these regions have experienced oppression in vastly different ways.

The importance of race and class as factors situating oppression has historically been an integral part of non-Western feminist movements. Feminists in India and Africa, for instance, have relied on Marxist or socialist ideologies and the accompanying importance of class analysis to

locate and describe female oppression. In many former European colonies, women became involved in anticolonial independence movements throughout the 1960s and 1970s. In most cases, the experience of colonialism and the racism that is inherently a part of this represented the dominant oppression. Furthermore, the concerns that drove second-wave feminists were often not relevant for women outside Western political and economic structures. In India, for example, female infant mortality, child marriage, and the issue of dowry were among the major concerns of Indian women in the 1970s.

Postcolonial theorists such as Gayatri Chakravorty Spivak and Chandra Talpade Mohanty have increased debate about the nature of feminism in non-Western countries. Much like third-wave feminists, women in non-Western feminist movements have criticized the predominant whiteness of the feminist movement in North America and Europe. Another common critique is that Western feminism tends to homogenize or appropriate the experiences of Third World women and assume a level of oppression similar to that of the West. In reality, there is no universal experience of oppression. Likewise, the second-wave theory that gender must be the overriding source of oppression has very little relevance for women in the Third World. While this idea has long been recognized by Western women of color, it has historically characterized non-Western feminist movements.

Second Wave Feminism in Europe and the United States

In the 1960s and 1970s, women throughout Europe and the United States drew attention to issues that impacted women's lives and fought

to improve their status in the workplace, their homes, and their countries. Among these women's many concerns were equal pay, education, employment opportunities, access to contraception and abortion, improved health care and child care, an end to domestic violence and rape, and lesbian and gay rights. In large organizations and small informal groups, in small towns and large cities, women from diverse economic and cultural backgrounds identified the problems they faced in their everyday lives and united to overcome such challenges by changing laws and bringing new awareness to women's rights. Together, their efforts became the second-wave feminist movement.

Movement participants, advocates, and enemies called it second-wave feminism because when women fought for political and economic rights in the 1960s and 1970s, it was not the first time they had done so. During the late nineteenth century and early twentieth century, what are now known as the first-wave feminists in the United States and Europe fought most specifically for the right to vote, which would give them a real say in national government. American women and European women in nations such as Britain, Germany, the Soviet Union, and Sweden attained voting rights successfully by the early 1920s.

By the mid-twentieth century, even more European women had won voting rights, but European and American women also began to realize that voting rights were not enough. During World War II as men enlisted, women across Europe and the United States took on jobs formerly held only by men while also serving in militaries. After the war, as more and more women tried to balance both work and home, they experienced a tension between the new realities of their lives and the growing demand that they return to their traditional roles for women as wives and mothers. In 1949, French author Simone de Beauvoir's *The Second Sex* focused on the ways in which women historically had been subordinated to men. Little more than a decade later, New York housewife and writer Betty Friedan wrote *The Feminine Mystique* to explore why women—particularly American housewives—seemed to be so unhappy with their lives. These two books would become touchstones to American and European women in the years to come.

In the United States and in Europe, second-wave feminists divided into two general groups: liberal (or equal rights or welfare) feminists and radical feminists. Both groups of activists often had similar goals but took very different approaches to activism. Liberal feminists and socialists often employed direct action, lobbying congressional representatives or creating lawsuits to fight sexual harassment or unfair work conditions and launched similar efforts through legal channels to change laws or to create new ones. Radical feminists, meanwhile, believed in the need to change people's conceptions about women's social roles and rights before trying to change legal systems. Both groups of feminists engaged in consciousness-raising (CR) sessions in which women came together to talk about the problems they confronted and to explore ways to resolve them. All feminists also utilized protest tactics and similar activities to varying degrees. No matter their approach, however, all feminists shared the common goal of expanding women's rights and opportunities. Liberal feminists, such as those in the American National Organization of Women (NOW) or the Dutch Man-Woman Society, emphasized women's equality with men. Some more radical groups such as the French *Féministes Revolutionnaires* and the U.S. Redstockings asserted that women were better than men and deserved an appropriate social position to reflect that or argued that women must be separate from men entirely in order to achieve true equality.

In the United States, the civil rights movement offered many women their first experiences in social organizing. The New Left and student movements of the 1960s also influenced women in both the United States and in many European nations. In the United Kingdom and other European nations, working-class women often dominated the movement. In the United States, the second-wave feminist movement tended to be a middle-class phenomenon that often alienated women of color when white feminists privileged gender divisions over those of race or class.

Partly because of the diverse range of feminist opinions, tactics, and perceived goals, second-wave feminism generated a sizable opposition that included men and some women, such as the American Phyllis Schlafly, who fought suc-

cessfully against the long sought after Equal Rights Amendment to the U.S. Constitution. Although results were mixed, by the end of the 1970s and the early 1980s, women across the United States and Europe had gained ground. Women won access to a wider array of professional occupations than ever before and began to take on jobs previously held only by men. In the United States, newspapers did away with sex-segregated "Help Wanted" ads. Women's health facilities began to emerge across Europe and the United States, providing new venues in which women could gain knowledge about their bodies and their distinct physical needs and capabilities. Abortion remained a key item on feminist agendas, with many nations granting abortion rights to varying degrees.

Men's Movement

The men's movement emerged in the 1970s as a response to concerns raised by the feminist movement about men's roles in liberating women. As women pressed for equality, men who were sympathetic to their appeals wondered how they might help raise consciousness about prejudice and restrictions against women. The first wave of the men's movement, which is sometimes referred to as men's liberation, grew out of this line of questioning.

Early participants in this first wave dedicated their efforts to exploring how sexism injured both women and men. The idea, akin to a major tenet of the civil rights movement, was that prejudice begot prejudice and that men who enabled or allowed sexism in public or private were also hurting themselves. They believed that traditional

➤ IRON JOHN EXCERPTS

“The Fifties male . . . got to work early, labored responsibly, supported his wife and children, and admired discipline. Reagan is a sort of mummified version of this dogged type. This sort of man didn’t see women’s souls well, but he appreciated their bodies; and his view of culture and America’s part in it was boyish and optimistic. Many of his qualities were strong and positive, but underneath the charm and bluff there was, and there remains, much isolation, deprivation, and passivity. Unless he has an enemy, he isn’t sure that he is alive.”

“In the seventies I began to see all over the country a phenomenon that we might call the ‘soft male.’ Sometimes even today when I look out at an audience, perhaps half the young males are what I’d call soft. They’re lovely, valuable people—I like them—they’re not interested in harming the earth or starting wars. . . . But many of these men are not happy. . . . Ironically, you often see these men with strong women who positively radiate energy.”

Bibliography

Robert Bly, *Iron John: A Book about Men* (New York: Vintage, 1992), 2–3.

gender stereotypes, which depicted men as powerful and tough, damaged both women and men and that attacking such stereotypes might benefit both genders. By eliminating gender stereotypes, perhaps they could help both women and men fulfill their true potential.

Although the first wave of the men’s movement in the 1970s was a clear response to the women’s liberation movement, it also owed much of its energy to contemporary civil rights movements. The search by black Americans for equality and dignity reminded contemporaries that not all men were part of the machinery of oppression against which largely white feminists struggled. Similarly, the gay rights movement of the 1970s demonstrated that men who did not fit dominant gender stereotypes could demand recognition and dignity as men. Together, feminists, blacks, and gays challenged the existence and acceptance of the traditional image of men as stolid, oppressive, and powerful.

While men who belonged to the first wave of the men’s movement were sympathetic to and supportive of the feminist movement, men in the second wave sought to pursue a similar therapeutic course for men. The second wave, or mythopoetic phase, of the men’s movement called for men to return to their roots and, perhaps as a consequence, to reject many of the assumptions of feminism. Inspired in part by poet Robert Bly, who later wrote *Iron John* (1990), one of the movement’s founding texts, these men argued for the need to escape the emasculating influences and pressures that an overdominance of women supposedly created. These men also rejected the template for masculinity from the 1950s of the organization man who repressed his emotions. With a view to recovering their lost masculinity and emerging from the malaise of modern manhood, the mythopoetic men attempted to return to nature, sometimes entering forests and beating drums. They also discussed their problems with groups of like-minded men and sought a greater emotional authenticity.

In the mythopoetic men’s movement, some viewed feminism critically, believing that any gains by women, however slight, became evidence that men’s power was dwindling. But while the popular media made much of this aggressive antifeminist slant, most members of this second wave did not wholly adhere to it. By the mid-1990s, members of the second wave dis-

Men beating drums at one of the Wild Man Gatherings inspired by the writings of poet Robert Bly. (Mark Peterson/Corbis)

cussed more universal and community-oriented topics, such as how to be good fathers while shunning the angry white-men image. Groups such as the Christian Promise Keepers and leaders such as Minister Louis Farrakhan organized massive rallies of men with a view of demonstrating a commitment to unity, family responsibility, and racial equality. In that sense, the men's movement had thus come full circle, as contemporary members, like their first-wave counterparts, embraced diversity within their all-male gatherings and promoted the idea that men and women alike should be in touch with their emotions. In lieu of marching out to the forests to discuss their fears of feminism, members of the modern men's movement now openly post their concerns and hopes on Internet blogs and Web sites. The men's movement, however, seems inevitably linked to the rise of feminism and the sense of a challenged masculinity.

"Makeover" Men— Bodybuilding and Masculinity

Although bodybuilders share a history with the sideshow strongman that dates back at least to the nineteenth century, bodybuilding did not emerge as a popular sport until well after World War II. The changing fortunes of bodybuilding, and the associated shift of emphasis from strength to self-discipline and physical beauty,

have informed our modern understanding of the meaning of masculinity. Yet bodybuilding has always been tied to the ethos of success and self-improvement.

The first man to gain recognition as a bodybuilder was Eugen Sandow, who at the turn of the nineteenth century was idealized by men and women alike as an ideal specimen of physical culture. During a period when Americans were relatively modest about public displays of the body, Sandow was able to publish nude and seminude pictures of his muscular body. Some modern scholars have suggested that Sandow's muscular nakedness was an early form of publicly available gay erotica. One might argue, in fact, that the entire culture of makeover men—indeed, the entire bodybuilding industry—stemmed in part from its homoerotic appeal. Sandow's example inspired Bernarr Macfadden, a tireless promoter of physical culture and health food who in 1899 published *Physical Culture*, the first of his many magazines.

In the United States, immigrants who were otherwise segregated from the mainstream culture could use bodybuilding as a physical makeover and attain a degree of acceptance. One example was Angelo Siciliano, an immigrant from Italy. In the 1920s, Angelo built up his body, changed his name to Charles Atlas, and after winning Bernarr Macfadden's 1922 award for "Most Perfectly Developed Man" advertised his Dynamic Tension mail-order program for bodybuilding with pictures of his own muscular body. Like Atlas, Bob Hoffman, who founded the York Barbell Company in 1938, promoted a lifestyle along with his product. Hoffman thought that strength, not just muscle, was key and this emphasis on power must have appealed to would-be muscle men who desired agency and not just corporal development.

Modern male bodybuilding owes much to the Canadian brothers Joe and Ben Weider, who founded the International Federation of Bodybuilders (IFFB) in 1946. Eschewing strength and emphasizing physical beauty, the Weiders were rivals to Hoffman's bodybuilding philosophy. Both camps advertised their version of masculinity through various magazines and competitions, but the Weiders, who focused on showmanship, performance, and sexual charisma, won out.

> CHARLES ATLAS

(Library of Congress)

It is difficult to overestimate the influence that Charles Atlas and his mail order business selling his Dynamic Tension exercise and bodybuilding method had on American culture from the 1920s on. Atlas tapped into the very American ideals of self-help, self-determination, and independence. The boy who bought Atlas's Dynamic Tension program as advertised in comic books was also buying into the rags-to-riches legend traced earlier in Horatio Alger's stories for boys in the nineteenth century. Like the boy in some of Atlas's advertisements, the purchaser hoped to transform himself from a 97-pound weakling into a strapping muscle-bound man. When Atlas presented cartoons in which a bully kicked sand in the face of the skinny boy, young people identified with the victim. Atlas amassed a fortune through his salesmanship, and he was cited in a whole range of popular culture artifacts, including songs, books, and movies. He even inspired President George H. W. Bush to liken Iraqi dictator Saddam Hussein to a bully kicking sand in America's face.

—Joel Silverman

During the Cold War, as masculinity became popularly equated with a more prominent and muscular shape and form, bodybuilding gained respectability. The Weiders and other entrepreneurs stoked the public interest in bodybuilding, and the movement spawned businesses such as gyms, health clubs, weightlifting equipment, health food products, and an underground trade in anabolic steroids. In the 1980s, major feature films featured muscle-bound actors such as Arnold Schwarzenegger (whom Joe Weider discovered and promoted in the 1970s) and Sylvester Stallone. With the election of the foreign-born Schwarzenegger to the governorship of California in 2000, bodybuilding culture had clearly entered the mainstream.

Comic Books and Masculinity

Comic books, despite being unfairly characterized as kids' stuff by some, have been recognized by recent historians and other social science scholars as treasure chests filled with cultural, social, political, and gendered meaning. Like other historical artifacts, comic books tell us about the time in which they were created and generally reflect the prevailing attitudes and ideals of society at large. Specifically, notions about the qualities that make a "real man" changed over the twentieth century and, subsequently, so have male superheroes in U.S. comic books.

Because comic book creators are in the business of making successful products, they want their characters to reflect the sense and mood of the time. The most successful superheroes are those whom readers can identify with personally. Many readers, especially the younger ones, look for qualities in a superhero that they can relate to or that they wish to emulate. For many young men and boys in the twentieth century, comic books were one of the first and most accessible places to encounter different masculinities and reimagine their own masculine identity, and thus these texts represent an extraordinary place to explore the historical portrayal, construction, and interpretation of masculinity.

Focusing on the 1960s, there were strong challenges against prevailing notions of masculinity in comic books, just as there were in America at large. During these years of political and social turmoil, the dominant masculinity of the 1940s and 1950s—white, heterosexual, self-confident, unquestioningly patriotic, and law abiding—came under attack and changed in ensuing decades. In the 1960s, just as a new generation of men and women questioned authority, fought the establishment, and embraced social and racial equality, a new generation of superheroes became more liberal. Superheroes such as the Green Arrow and the Silver Surfer cared as much about social inequality as they did about defeating rampaging monsters. This was in part a reflection of the fact that the young comic book readers of the 1940s and 1950s had grown up and matured. The change in the age of readers was evident in the new popularity of superheroes on college campuses in the 1960s. A 1966 issue of *Esquire* reported that an unprecedented amount of mail originating from college campuses was delivered to the Marvel office, that 50,000 college students had paid to become Marvel fan club members, and that Stan Lee's lecture at Bard College drew more attendance from students than did one by Dwight D. Eisenhower. It logically followed that as comic book readers matured, so too did their favorite superheroes.

Superheroes challenged the consensus of optimism and confidence, established in the pre-Vietnam War era, in the American virtues of anticommunism, corporatism, consumption, domesticity, and middle-class social aspirations.

Marvel Comics was the most successful at creating this kind of narrative, crafting new heroes such as the Fantastic Four, Thor, Spider-Man, the Incredible Hulk, and Iron Man, who reflected the uncertainty of Cold War America. Ambiguity, self-doubt, alienation, and imperfection came to define the superheroes of the 1960s and 1970s. Readers were presented with the irony of a superhero who could not always accomplish what he set out to do, despite his superpowers. For example, Spider-Man, the Marvel hero, could not save his uncle Ben or his girlfriend Gwen Stacy from death despite his superpowers and heroic deeds. This frustration echoed the feelings of many American men after their country's loss in Vietnam. Furthermore, as mutants, many of these superheroes grappled with feelings of doubt, self-loathing, and isolation with which adolescent readers could relate.

The 1970s and 1980s witnessed a reaction against the uncertainty of the previous decade with the introduction of the ultraviolent antihero in comic books. Amid political scandals, right-wing reactions to the 1960s, and the ending of the conflict in Vietnam, superheroes changed into something much harder, more violent, and disillusioned. The Boy Scout-like characters such as Superman, who represented the once-dominant masculinity of the 1930s and 1940s, dropped in popularity to the new men of violence and ripped bodies typified in characters such as Wolverine and the Punisher.

Susan Jeffords argues that representations of Vietnam in mass culture during the 1970s and 1980s became emblems for the remasculinization and regeneration of patriarchy in the United States in the face of challenges to older masculine ideals. Many American men were fed up with the ineffectiveness of their government and political figures and blamed the loss in Vietnam on a feminized federal government, seemingly unwilling to do everything necessary to win wars. Film also reflected these sentiments. Just as movie audiences embraced the character of Rambo for giving voice to the frustrations with government and society, so too did readers embrace a new breed of superheroes that embodied the remasculinization of America. Marvel's own fighting machine, the Punisher, actually predates Rambo by eight years. These and similar

characters, often returned Vietnam veterans, were social outcasts and loners who bypassed authority and law to exact their own brand of street justice against criminals. Visual depictions of the male body in comic books also changed dramatically, reflecting this remasculinization. With muscles as external signifiers of masculinity, male superheroes were increasingly drawn as hypermasculinized in the 1970s and 1980s.

Ultimately, superhero comic books show us that masculinity is a malleable cultural marker that changes over time. Through their pages we see what values, emotions, and images defined what it meant to be a man at different moments during the twentieth century.

Women in Islamic Societies, Post-1945

The status of women in Islam is defined by the history and culture of the greater Muslim world and the teachings of Islam in its various texts and their interpretations. Some Islamic scholars argue that the Quran (holy book of Islam) supports the idea of Muslim women's religious and moral equality to that of men. However, Sharia (Islamic law), the official law of many Islamic countries, establishes significant differences between men and women in terms of their respective rights, duties, and obligations. Nonetheless, some countries with sizable Muslim majorities have given women substantial rights in their constitutions while maintaining cultural restrictions on women's behavior and status. Many conservative Islamic scholars (among them Islamic funda-

Women wearing burqas on a street in Istanbul, Turkey. (Tinou Bao)

mentalists) argue that the differences between men and women as consecrated in Islam are timeless and not open to interpretation. In contrast, many liberal Muslims and Muslim feminists maintain that more progressive interpretations, based on older analyses of the Quran, can reconcile Islam with the liberation of women in the Muslim world.

The history of the Middle East, North Africa, and Central Asia has been shaped by centuries of the admixture of the religious tenets of Islam with regional cultures. In the decades following the end of World War II, in the wake of decolonization and the emergence of multiple nation-states in the Near East and Central Asia, many Muslim-majority nations found it expedient to offer women the franchise and greater civil rights, in part to foster suitable diplomatic relations with the West. Building on the modernizing example of Turkey earlier in the century, countries such as Iraq, Egypt, and Iran focused their nationalist energies on creating a secular state bent on modernization while adapting Western ideologies to their own ends. However, while some of these countries did allow women some level of civil rights according to their secular constitutions, women often were nonetheless

constrained to follow Sharia in the domestic sphere of family and overall daily life, in accordance with long-established local and regional cultural norms.

The new secularizing tendencies offended many traditional Muslims and religious leaders; one result was the emergence of reactionary forms of Islamic fundamentalism, which saw these secularizing values as a polluting influence on the lands of Islam. Many Muslim women found themselves constrained both by nationalist secularizing forces that reinforced local customs (and their patriarchal arrangements) as well as by Islamic fundamentalists who sought to install Sharia and its resulting constraints on the civil rights of women. Forms of public shaming and abuse, including beatings, remained common as punishment for adultery, wearing clothing deemed immoderate, or appearing in public without a male chaperone. This unofficial enforcement of gender role norms often was tolerated by government officials even when deemed illegal by the state legal system.

In more fundamentalist states, Sharia inflects much of the legal system. For example, Saudi Arabia and Iran maintain specific religious courts for civil law matters as part of their legal codes. Legislation derived from Sharia also has been instituted in countries such as Afghanistan (most recently under the Taliban), Libya, and Sudan to a lesser extent. Other countries, such as the Palestinian territories, Egypt, and Algeria, while not instituting Sharia officially as part of their legal and penal codes, tend to look the other way to its unofficial practice, effectively tolerating it as a characteristic of regional Islamic culture.

Islamic scholars, academics, and Muslim feminists are currently engaged in a debate concerning the status of women in Islam. Many conservative scholars in countries such as Iran, Saudi Arabia, and Pakistan advocate maintaining Sharia and cultural norms in terms of modest dress (such as *habibs*, *chadors*, or *burqas*), deference to the husband, legal status, and sexual segregation. However, many liberal Muslims and Muslim feminists advocate a more progressive stance and interpretation of Islamic law and cultural standards, allowing women greater freedom, access to education and employment, and increased legal and political representation.

➤ HONOR KILLINGS AND MUSLIM WOMEN IN EUROPE

A common problem in European Muslim communities, as they become increasingly alienated from greater European society and economically and socially marginalized, is the influence of Islamic fundamentalism and its associated social constraints for Muslim women. According to various European law enforcement agencies, women's activist groups, and moderate Islamic organizations, in recent years growing numbers of Muslim women are killed and/or mutilated to uphold their family's honor in accordance with cultural and religious traditions from their countries of origin. Such cases typically involve an attack on a Muslim woman by a close relative, typically a brother or father angered by her refusal to accept a forced marriage or her insistence on leading a European lifestyle in denial of her Muslim heritage.

According to official German police, newspapers, and activist organizations, there were approximately eight episodes of honor killings in Berlin in 2005 and approximately 47 killings of Muslim women in Germany within the previous six years. It is estimated that tens of thousands of European-born Muslim women are forced into unwanted marriages, often to much older men, in their family's country of origin to ensure a proper Muslim family unit in accordance with cultural and religious traditions. Refusal to submit to such marriages has the potential of resulting in an honor killing at the hands of the woman's own relatives. Britain, France, and other European countries' with sizable communities of Muslim immigrants are also plagued by the problem of honor killings, associated with the growing problem of Islamic fundamentalism in these countries. This also places severe constraints on Muslim women living in the liberal democracies of Europe that mirrors the lot of Muslim women in much of the Middle East, North Africa, and Central Asia.

—Abraham O. Mendoza

In spite of these disagreements in the Muslim world, many women have managed to achieve positions of political power and influence, most famously Benazir Bhutto who had served two terms as prime minister in Pakistan and continued to be a power broker until her assassination in 2007.

In spite of calls for progressive reform, women in Islamic societies continue to exist in an environment hostile to change, with the potential for honor killings, domestic violence, enforced dress codes, and severe constraints on civil liberties, particularly in Saudi Arabia, the Palestinian territories, and Iran. Many of these patriarchal attitudes and customs also shape the experience of women in Muslim diaspora communities throughout the West, such as in France, Germany, and Britain. Despite greater freedom under the host countries laws, women of the Islamic diaspora remain vulnerable to the cultural constraints of their immigrant communities, imbued with patriarchal values stressing the subservience of women to men.

Transgender

The term “transgender,” in popular usage only since the early 1990s, is an umbrella term describing people who do not identify with the binary gender positions of man or woman. Drag kings, drag queens, transsexuals, intersex people, cross-dressers, butch lesbians, effeminate gay men, and more may all be considered transgender people. Although some of the gender identities included in this list are linked to sexual desires (such as butch lesbians and effeminate gay men), a transgender identity does not imply a particular sexual orientation; transidentified people may name their sexual desires as heterosexual, homosexual, bisexual, asexual, or something else.

As an identifying term, “transgender” is an alternative to “transsexual,” which more specifically designates someone who medically transitions to another sex. “Transsexual” is often understood as a pathologized term due to its

emergence in the 1950s from psychological discourses of gender identity disorder. While transsexuals fall under the transgender umbrella, calling oneself “transgender” often signals a more radical gender politics of identifying as a gender between or outside of male and female, while “transsexual” often signals a transition from one stable, coherent gendered position to “the other,” affirming a binary conception of gender. Therefore, some people who have medically transitioned (thus fitting the technical definition of transsexual) may nevertheless identify as transgender, rejecting the pathologized connotation of transsexual. The terms “transgender” and “transsexual” may thus refer to very similar embodiments, even if they do not refer to similar gender politics.

Because the definition of “transgender” overlaps with that of “transsexual,” the history of transsexuality informs our current understanding of transgender. Western transsexual and transgender identities emerged in the twentieth century as a result of changes in the understandings of sex along with developments in endocrinology and plastic surgery. The possibility of sex change allowed by these developments was popularized for people in the United States through media accounts of Christine Jorgensen’s sex reassignment in Denmark in 1952. Having newly discovered these technologies, people wrote letters to mental health and medical professionals detailing their cross-gender identifications and requesting sex reassignment. Sexologist Harry Benjamin received many of these letters and directed a number of transsexuals to sympathetic specialists.

Benjamin subsequently wrote *The Transsexual Phenomenon* (1966), outlining a portrait of transsexuality read by therapists and by those seeking transition. Thus armed with the transsexual life history sure to get them the surgeries they desired, transsexuals repeated this narrative in the 1970s and 1980s to service providers. Clinicians remarked on the accuracy of Benjamin’s profile of transsexuals, noticing that many of their patients shared similar stories of feeling trapped in the wrong body from a very early age and of having asexual or heterosexual desires post-transition. This narrative was codified, starting in 1980, in the American Psychiatric Associa-

tion's *Diagnostic and Statistical Manual (DSM)* under "Gender Identity Disorder." This diagnosis remains, although many now recognize that there are multiple transgender experiences.

The newer term "transgender" was first used by Virginia Prince in the 1980s. She used the term to distinguish between transvestites (now more appropriately called cross-dressers) who occasionally wear clothing of the other sex and transsexuals who undergo bodily modification to live as the other sex. Prince used the term "transgender" as a noun to describe, for example, someone who lives in the role of the other sex without undergoing bodily modification.

However, the meaning of "transgender" changed when activist Leslie Feinberg used the term in the pamphlet *Transgender Liberation: A Movement Whose Time Has Come* (1992). Feinberg used the term as an adjective to establish a political alliance among all people who were opposed to the binary gender system. Susan Stryker, an important transgender theorist and historian, points out in her 2006 essay "(De)Subjugated Knowledges" that the term "transgender" grew in popularity in the early 1990s to describe a variety of gendered embodiments and expressions too complex to be accounted for by a binary model of sex and gender.

Although many people still find comfort in the normative forms encouraged by psychologists in the 1980s, some people are choosing to inhabit genderqueer and other spaces that defy easy categorization, opting to only take hormones, to have certain surgeries but not others, or to simply transition socially, forgoing hormones and surgeries altogether. In short, some are choosing to craft incoherently gendered bodies. In the context of these varied embodiments and identities, transgender theory is an emerging body of intellectual work drawing its lineage from feminist and queer theory, expanding on theoretical themes from these fields by attending to the transgender phenomena that question conventional alignments of sex, gender, and sexuality.

LOU SULLIVAN

According to Susan Stryker's essay "Portrait of a Transfag Drag Hag," Louis G. Sullivan, born female, had no connections to other female-to-male (FTM) transpeople living in Milwaukee in the 1970s. Instead, he found a sense of community among drag queens and gay activists and referred to himself as a "heterosexual female transvestite" to account for his attraction to men and his masculine presentation. After moving to San Francisco, Sullivan attempted to medically transition to male in 1976 but changed his mind. He spent the next three years overcoming internalized misogyny by participating in feminist consciousness raising and learning automobile maintenance. When he transitioned in 1979, he spoke with psychologists, challenging their idea that only heterosexual transpeople could successfully transition. He also published a pamphlet titled *Information for the Female-to-Male Cross-Dresser and Transsexual* and established an FTM support and advocacy group in San Francisco.

Sullivan celebrated his newly embodied gay male identity in 1980 by visiting gay bathhouses. At this point, the AIDS epidemic had been affecting the community for a few years but was not yet well understood. Sullivan died of AIDS-related complications in 1991 at the age of 39, but his activism laid some crucial groundwork for FTM community organizing and for transhomosexuals seeking transition.

Postwar Changes in Sexual Mores in the United States

The mid-twentieth century (1940s to 1960s) in the United States is sometimes characterized by political and religious conservatives as a period of high moral virtue, a period when everyone adhered to strict rules about sex, and as a period when sexual behavior occurred only in monogamous heterosexual relationships between two married people of the same race and only for the purpose of procreation. While this may reflect how sexuality was presented (or sanitized) on popular television shows or in the Hardy Boys series of detective novels for teenagers of the 1950s, it has little other validity. Yet as these cultural representations would suggest, in the mid-twentieth century talk about sexual activity was not as common as in more recent decades. Many factors, such as the postwar vogue for psychoanalysis, the publication of the Kinsey Reports, and the 1960 introduction of the "Pill" as well as emerging demographics that fueled the youth rebellion of the 1960s encouraged the ensuing sexual revolution of the 1960s and 1970s. In subsequent decades talk about sexuality and assumptions of the importance of such openness became more prevalent in everyday life and in media.

Other than increased honesty in talking about sexual behavior, however, were there major differences in sexual behavior? As was the case with masturbation and petting, premarital intercourse among adolescents was common in the mid-twentieth century, though regularly denied. Teen birth rates reached a high in the mid-twentieth century that has not been equaled

since. In 1957, 97 out of every 1,000 girls between the ages of 15 and 19 gave birth. That number has declined since and was just 41.2 births out of every 1,000 in 2004. The high birth rates among teenagers in the mid-twentieth century were masked by several behaviors that were no longer commonplace by the end of the twentieth century. First, the average age of first marriage was substantially lower in the mid-twentieth century. The lower age at first marriage often masked premarital intercourse by legitimizing it: unmarried adolescent women who became pregnant often married their sexual partner, covering up their illegitimate child-births. For those who could not or would not marry the father, rehabilitation was often the result: the child was placed for adoption, and the woman was encouraged to start over, giving the impression that she had never had a child.

Another illustration of changing attitudes toward sex and social taboos is the change in frequency of cohabitation. Reflecting a genuine lifestyle revolution, the number of cohabiting couples increased by almost 1,000 percent between 1960 and 2005. In the same ways interracial sexual relationships, although still subject to public opprobrium, are more common, legally sanctioned, and presented in the media. Changes have been even more dramatic in same-sex relationships. While underground homosexual cultures thrived in population centers such as Chicago and New York, in the mid-twentieth century almost all public discussion of homosexuality framed it as a disorder or sin, and in many places it was against the law. Attitudes toward homosexuality began changing in the 1960s, as the civil rights and women's liberation movements encouraged the formulation of the gay liberation movement in the late 1960s. After many protests, the scientific community stopped considering homosexuality a disorder in 1974, when it was officially removed from the list of recognized psychological disorders by the American Psychological Association. While homosexuality is still marginalized in the United States, attitudes toward and laws regulating homosexuality have changed since the mid-twentieth century. For instance, when asked in 1973 whether they thought sex between two adults of the same sex is wrong or not, 73 percent of adult Americans

said that it was “always wrong,” while only 11 percent said that it was “not wrong at all.” In 2004, 58 percent said that it was “always wrong”; 32 percent said that it was “not wrong at all.”

What were the origins of the sexual revolution? One possible factor was the increase in knowledge about sex and sexual behavior, particularly with the publication of the Kinsey Reports. Another major factor leading to changing sexual mores was the development of the birth control pill in 1960. The development of a reliable and easily accessible form of birth control for women reduced the risk of pregnancy, alleviating the major concern that women held about having premarital and extramarital sex.

The pill offered foundational support for a slow diminution of the double standard in sexual behavior between men and women. In the mid-twentieth century men were expected to be sexually aggressive and promiscuous; women were not. While popular marriage manuals might indicate otherwise, even in marriage women were supposed to submit to their husbands, lessening the possibility of their own sexual fulfillment. The sexual revolution of the 1960s was, in part, a response to this double standard. Many of the changes in social mores that took place in the latter half of the twentieth century were realignments of standards for men and women, bringing the expectations of sexual behavior for women in line with those for men. Even so, this double standard of sexual aggression has not completely disappeared. It is still expected in many parts of the United States that men will be more sexually aggressive than women. A 1991 survey of junior high school students found that a majority of students believed that a woman was “asking” to be raped if she wore a seductive outfit on a date; 80 percent believed that married men had a right to force their wives to have sex with them. It also remains the case in some regions of the United States and among some subcultures that sexually active women are denigrated while sexually active men are praised.

While the United States remains more sexually restrictive than many other developed countries, U.S. culture is more open to frank discussions of sexual behavior in the early twenty-first century than in the mid-twentieth century.

—Ryan Cragun

➤ THE KINSEY REPORTS

Why did attitudes toward sex change between the mid-twentieth century and the late twentieth century? One possible factor leading to these changes was the increase in knowledge about sex and sexual behavior. One of the first U.S. scientists to examine sexual behavior was Alfred C. Kinsey, whose research team interviewed thousands of Americans about their sexual history. While some of his findings and methods have since been challenged, Kinsey's research revealed behaviors generally denied by society in the 1930s and 1940s. Prior to his investigations, studies of human sexual behavior were not widely available in the United States. Kinsey's publications on sexual behavior among men (1948) and women (1953) prepared the way for a sexual revolution in the 1960s. Social mores in the United States, however, continue to hamper the spread of such knowledge. A recent study quizzed American adults on basic facts about biology and sexual behavior. The majority flunked. Knowledge is available in the twenty-first century, but access to it remains difficult due to restrictive social norms even after the sexual revolution.

History of Gay/Lesbian Rights Movement

The 1969 Stonewall Riot marked the beginning of a national and international gay and lesbian rights movement. On Friday, June 27, 1969, New York City police officers arrived at the Stonewall

► THE INTERNATIONAL GAY/LESBIAN RIGHTS MOVEMENT

The modern gay and lesbian rights movement has always been international. It first began in 1897 when the Scientific-Humanitarian Committee was founded in Berlin. This group began the trend of homosexual groups identifying themselves with secularization, science, and democracy. This early German effort, though, collapsed during the Holocaust when homosexuals were persecuted and executed by the German National-Socialist (Nazi) Party. After World War II, homosexuals faced authoritarian regulations of moral and sexual behavior in both communist and democratic countries. Despite these challenges, in the 1950s small political groups formed in Los Angeles, Paris, and Copenhagen. The contemporary movement, however, owes its formation more directly to the 1960s and 1970s student-based New Left movement. In places such as Japan, North America, Western Europe, Mexico, and Czechoslovakia, homosexuals utilized the New Left's critiques of the family and sexual repression to promote gay liberation and lesbian feminism. As part of this effort, the International Lesbian and Gay Association (ILGA) formed in 1979. ILGA has successfully lobbied Amnesty International to recognize lesbians and gay men as prisoners of conscience and has also lobbied the World Health Organization to remove homosexuality from its lists of mental diseases, in addition to publishing three Pink Books that describe the situation of homosexuals and offer proposals for improvement. Although homosexuals still face discrimination, today cities across North and South America, Europe, Africa, and Asia have gay and lesbian advocacy organizations.

—Kassi Klinefelter

Inn, a Greenwich Village gay bar. Throughout the 1960s, police raids on gay bars were common. On that night, though, the bar's occupants fought back. As police officers removed the bargoers, a crowd assembled outside and began taunting the cops. Then after a lesbian woman struggled with the officers, beer bottles were thrown. Next a parking meter was used to knock down the bar's door. Finally, someone lit the building on fire. These events sparked a

weekend of rioting throughout Greenwich Village and the formation of the Gay Liberation Front (GLF) in the following weeks. More importantly, the Stonewall Riot led homosexuals across the country to begin organizing. In commemoration of these events, the first gay pride parade was held on Stonewall's one-year anniversary. A new era of gay and lesbian activism began. However, these events evolved from 20 years of localized efforts.

Two prominent early groups promoting homosexual rights in the post-World War II era developed in California. In 1950, five men formed the gay rights organization the Mattachine Society in Los Angeles. For its first three years, the Mattachine, a secret society, fought for the recognition of homosexuals as a social minority with a unique identity. However, in 1953 the organization democratized its membership in response to allegations of communism. These events eventually led to the resignation of three of the founding members and a new direction for the Mattachine Society. Now under the leadership of Harold (Hal) Call, the organization moved its headquarters to San Francisco, started a monthly magazine, the *Mattachine Review*, and began promoting homo-hetero sameness.

The Daughters of Bilitis (DOB), formed in 1955, is the first known American lesbian emancipation organization. Like the Mattachine Society, the DOB underwent early changes. The San Francisco organization first suggested by Filipina Rose Bamberger was a lesbian secret social organization. Less than a year after its formation, it was restructured. Members Phyllis Lyon and Del Martin pushed for political activism. This shift led four of the original eight members to leave the DOB. At the end of 1956, the DOB published the first issue of the *Ladder*, its monthly newsletter (published until 1972). Like the Mattachine Society, the DOB's newsletter provided it national influence. For instance, in 1956 one of the Mattachine chapters had only five members, while the *Mattachine Review* had more than 500 subscribers. The Mattachine Society and the DOB both encouraged the assimilation of homosexuals into mainstream American society. However, the two organizations differed in their approach to group membership. The Mattachine Society was open to anyone concerned with ho-

mosexual civil rights, whereas the DOB was designed primarily for lesbians.

In the 1960s, homophile advocates, as they called themselves, promoted increased activism. Frank Kameny and Barbara Gittings, two homophile leaders, argued that activists should move beyond education and begin challenging unjust laws and public policies denying homosexuals equality. The 1960s protest movement helped the gay liberation movement spread. Some radical activists joined Black Panther marches. Additionally, the movement adopted elements of the feminist critique of American society. Their efforts led to dialogues with the Protestant clergy and the medical establishment in addition to legal challenges and public demonstration. However, the 1960s homophile activists left their biggest imprint by spreading an alternative view of homosexuality through the news coverage of their activities. Homophile activists, the Mattachine Society, and the DOB's activities provided the critical backdrop for a national and international gay liberation movement, initiated by the Stonewall Riots.

Since the Stonewall Riots, homosexuals worldwide have organized, fought, and won important civil rights improvements. Within four years of the riots, there were almost 800 gay and lesbian American organizations, and by the end of the 1970s, thousands existed. Major achievements include the lifting of the Civil Service Commission's ban on gay employees, the removal of homosexuality from the American Psychiatry Association's list of mental disorders, and the recognition of civil unions for same-sex couples

■ Introduction: Families and Family Planning

Family structure and family planning have become issues of global concern in the late twentieth and early twenty-first centuries as they intersect with international immigration and an increasing economic disparity. Moreover, family structure in the developed world has evolved into a more inclusive definition. Trends such as gay marriage adoption poli-

cies and the absence of children from households altogether have pushed the definition's boundaries. However, this dynamic has led to debates between traditionalist and liberal definitions of the family.

Global exponential population growth since 1945 has led to an increased level of transnational efforts, through the United Nations or foreign

aid, at setting population limits via family planning. The goal is to limit population growth and its detrimental effects on the environment, the international economy, international labor flows and accompanying problems, and poverty levels in the developing world (e.g., sub-Saharan Africa). In much of the developed world, the reduction in size of middle-class family households has resulted in public debates over the core ethnic population not reproducing in adequate numbers to sustain the welfare state and the subsequent necessity for allowing larger numbers of immigrants (mostly people of color); this discussion is carried out often in extremely coded, frequently racist, anti-immigrant rhetoric by politicians (e.g., in Germany, Britain, and France).

Religious organizations and more conservative sectors of the population in the West take issue with liberal state policies for family planning, which they interpret to advocate promiscuity (leading to the promotion of abstinence-only rhetoric as an alternative to sex education) and abortion as a means of contraception, particularly in the United States. However, in countries such as India and China, both with populations that have surpassed one billion, the institution of state policies on family planning has been deemed necessary to stem the potential chaos of runaway growth on their fragile economies. Nevertheless, instances of forced sterilization in India and the one-child policy in China have been heavily criticized for their alleged infringement on individual reproductive rights.

In contrast, couples making a conscious decision not to have children at all (often opting for a pet) or adopting have increased in much of the developed world as an alternative to the traditional family in an attempt, in part, to offset population growth. Nevertheless, alternative familial arrangements such as adoption of children by gay families have been of significant controversy in the West in relation to the polemic over gay marriage, particularly in the United States.

—*Abraham O. Mendoza*

Structural Shifts in U.S. Families since 1945

While the nuclear family was already the norm in the United States in the mid-twentieth cen-

tury, the structure of families since then has changed considerably. One of the more notable ways is in family timing. The average age at first marriage in 1950 was 22.8 for men and 20.3 for women; in 2003 the ages were 27.1 for men and 25.3 for women. This later age of first marriage means that there has been a substantial increase in the proportion of women under 40 years of age who have never married. But there has also been a dramatic increase in the percentage of women over 40 years old who do marry. Women over age 35 at the end of the twentieth century are significantly more likely to marry than were women over age 35 in the 1950s. Families are still forming; they are just doing so later.

Another effect of the later age at first marriage is fewer children. Women in the 1950s and 1960s had, on average, between three and four children. By the end of the twentieth century, women in the United States had, on average, fewer than two children. The proportion of children born to unmarried women increased by 10 percent in the 1980s alone, although almost all of that increase is accounted for by the increase of children born in cohabiting households. Families are also less likely to include both parents in the household. Between 1960 and 1986, the total number of children growing up with only one parent more than doubled, from 12 percent to 25 percent of all children under age 18. At the end of the twentieth century, half of all children spent at least some time in a single-parent household. In light of this change, it is somewhat surprising that the percentage of children in the United States who live with neither parent has declined since 1940. In 1940, 10 percent of children lived with neither parent; only 4 percent of children in the United States at the end of the twentieth century lived with neither parent.

Another surprising contrast to the higher rates of children raised in single-parent homes is the fact that both men and women spent more time with their children at the end of the twentieth century than they did in the mid-twentieth century. In 2000 men spent almost ten hours more with their children per week than did men in the 1970s; women spent about four hours more per week with their children. Additionally, due to longer life spans, close relationships with extended families were more common at

the end of the twentieth century than in the mid-twentieth century; 78 percent of adults consider their relationship with their grandparents close, and most adults talk with their parents at least once a week.

Several factors account for why children are less likely to have two parents while growing up. The first factor is, of course, divorce. Divorce rates tripled between 1960 and 1982. The 1982 rate continued through the end of the twentieth century: 50 percent of first marriages (and 60 percent of second marriages) end in divorce within 40 years. At the same time, rates of cohabitation have increased. In 1960, only 439,000 couples (0.5 percent of the total U.S. population) lived in a nonmarital opposite-sex household. By 2006, the number of cohabiting couples increased to 6 million—if you include same-sex unmarried couples (4 percent of the total U.S. population)—to become the majority experience among cohorts of marriageable age. Furthermore, a majority of people cohabited before marriage by 2000. In 2005, the percentage of households made up by married couples dropped below 50 percent, compared to 84 percent in the 1930s.

Many factors play a role in these changes. One of the biggest is the decline in real wages since 1972, when they hit their postwar peak. Real wages increased through the late 1940s to the early 1970s but declined from the 1970s through the mid-1990s, meaning that workers made less money relative to inflation at the end of the twentieth century than they did immediately after World War II. The decline in real wages forced many middle-class families that wanted to maintain their middle-class lifestyle to transition from a single-income family to a dual-income family in which the wife worked. Another factor that facilitated this transition was the increase in consumer goods—washing machines, dishwashers, electric irons, and so on—that freed up considerable amounts of wives' and mothers' traditional time working in the home. Additionally, women made inroads into higher education during the second half of the twentieth century and now outnumber men in undergraduate enrollment and in graduation rates. Marriage was delayed to pursue job training and education, which in turn has delayed the age at which women have their first child. While the problem

➤ PETS AS FAMILY MEMBERS

A recent phenomenon across the West is the greater inclusion of pets as family members, in some instances comprising the sole object of affection for childless couples. As the cost of raising a child increases in much of the West, many couples have chosen not to have children and choose to dote their parental affection on a dog or a cat or even birds, fish, or other creatures. In countries such as the United States, France, and Japan, many childless couples may spend a considerable amount of their disposable income on pet spas, toys, doggie or kitty hotels, physical therapy, and other luxuries. An entire industry catering to pet owners, not just in terms of pet products but also services, is estimated to earn in the tens of billions of dollars in the United States alone. According to San Francisco's Animal Care and Control Department, that California city has an estimated 120,000 dogs in contrast with anywhere to approximately 108,000 to 113,000 children as estimated by U.S. Census figures in 2005. Trendy restaurants and coffee shops, not to mention some employers, now allow people to bring their pets along.

—Abraham O. Mendoza

of lower real wages for women remains a challenge, the greater equality between men and women has made women less dependent on men for support and freed them to live outside traditional nuclear family arrangements. The women's movement of the 1960s and 1970s and changes in divorce laws also empowered many women to leave abusive relationships. All of these factors along with changing attitudes toward marriage and women's roles resulted in substantial changes in the family in the second half of the twentieth century.

Family Planning in India since 1945

Sometimes celebrated, sometimes reviled, India’s family planning program has been described as both a model for other developing nations and a cautionary tale. These mixed reviews have plagued the program since its inception. In 1947 the Indian government led by Jawaharlal Nehru initiated a plan to modernize the newly inde-

pendent nation. Twentieth-century modernization theories viewed state-run population control efforts as an essential step in achieving modernity, but Indian attitudes were not as enthusiastic regarding family planning. Early promoters of family planning had been British social reformers, but the influential Mahatma Gandhi opposed birth control in favor of sexual restraint. Consequently, many nationalists found family planning to be in dissonance with Indian independence. However, Nehru believed that population control was essential to India’s modernization, and in 1952 India became the first nation in the world to implement an official family planning program. In its 55-year history, the program has promoted a number of different strategies from education to incentives to limit India’s growing population.

Family planning began as a voluntary program in the 1950s but over time became more coercive. Initially, India’s family planning program worked to increase the availability of contraception information and services to women. After this strategy failed to meet expectations, efforts were intensified. Family planning officials were given targets prescribing how many people they were to recruit. While the government argued that targets helped set realistic goals, opponents argued that they were arbitrary and caused providers to pay less attention to users’ health.

Family planning efforts were further intensified under Indira Gandhi. In 1975, in response to widespread unrest, Gandhi declared a state of emergency and took authoritarian control of the government. Monetary assistance to states became contingent on family planning results, and certain licenses and permits were only made available to sterilized individuals. In order to meet targets, some officials forcibly sterilized men. During this emergency period, the number of individuals sterilized went up tenfold. Dissatisfaction with family planning was a major factor in the 1977 election in which Gandhi and the Congress Party were voted out of power and replaced with Janta (People’s) Party representatives. The new government tried to distance itself from the coercive tactics used during the state of emergency, changing the name of the national program from “family planning” to “family wel-

► ADVERTISING FOR SONS

In India, where there is a strong preference for sons, ultrasound technology has made it relatively easy for parents-to-be to find out the sex of fetuses and abort unwanted girls. While sex-selective abortions have been illegal in India since 1994, the law is difficult to enforce and consequently has not been effective. As a consequence, the latest estimates, as of 2007, show that there are only 927 females for every 1,000 male babies born in India.

While such staggering gender gaps are mostly associated with India and China, American doctors and companies are playing an increasingly important role in the business of having male babies. In America, advertisements directed at Indian immigrants, one of the fastest-growing ethnic groups in the United States, tout procedures that can preselect or identify the sex of a fetus. In India these advertisements would be illegal, but American advertising allows son preference to be expressed freely and openly. The effect of this advertising remains unknown, as there are no official statistics that show how common gender selection techniques are among Indian immigrants or other ethnic groups.

fare.” When the Congress party was voted back into power in 1980, Gandhi reiterated her commitment to family planning, this time emphasizing that the program was voluntary.

Since the 1990s, due to the pressure of international donors such as the World Bank, India’s family planning program has become more client-centered. In addition to efforts to limit fertility, the programs encourage public education, the empowerment of women, and the prevention of AIDS. In 1996 the government eliminated quotas and urged family officials to take a more user-friendly approach, consulting with individuals about their preferences and needs. In recent years, technology has come to the forefront of Indian family planning. Mass media campaigns encourage families to have no more than two children and to rethink the necessity of having sons. With a population of 1.3 billion in 2006, India is expected to surpass China as the world’s most populous nation by 2050; however, overall fertility rates are dropping. A new concern is the uneven ratio of males to females born as a result of India’s strong son preference, calling into question how India’s next generation will marry and reproduce.

Although targets have been abandoned, India’s family welfare program is still somewhat coercive, as it offers compensation and incentives for individuals who accept contraception services.

Family Planning in China since 1945

China’s landmass, which is slightly smaller than the size of the United States, supports a population that is more than four times larger than that of the United States. As China’s already sizable population began to swell in the twentieth century, population control programs were initially opposed by Mao Zedong based on the assumptions that a large population would fuel a strong economy and that large families were auspicious. However, when China’s first census in 1953 revealed that the national population was more than 100 million larger than originally thought, government officials implemented a population control policy.

China’s first official population policy encouraged couples to marry later, widely space their children, and use the free contraception

ADOPTION POLICY

Every year, with thousands of girl babies abandoned to orphanages, China has become the world's leading source of children for foreign adoptions. However, in 2007 the Chinese government enacted new restrictions on adoptive parents from foreign countries. These restrictions prevent prospective parents from adopting if they are single, obese, over 50 years old, or fail to meet other financial, physical, or psychological standards. China was once known to have a fairly open adoption system, so these new regulations are a blow to many prospective parents, who complain that the new rules are unfair and too strict. However, the Chinese government insists that such measures are necessary because the number of applicants far outweighs the number of available children.

—Meghan Davison

distributed by public health workers. Popularized by the slogan *wan, xi, shao* (“late, spaced, few”), the policy urged couples to have no more than two children. When these measures failed to adequately curb population growth, in 1979 China adopted the well-known one-child policy. Signaling a vast change in thinking since Mao's rule, Chinese ruler Deng Xiaoping argued that family planning was necessary for economic and social development. With few exceptions, families were limited to only one child, often forcibly. The policy was readily accepted in urban areas where families tended to be small; in rural areas, however, where large families and male children were needed for farm labor, the policy met with hostility.

In response to widespread resistance, the government was forced to relax the stringent one-child policy. Since 1984, rural couples are permitted to have two children. Regulations vary by province, but in many areas some couples are allowed to have a second child, especially if their first is female or disabled.

Still, small families have become the standard in China, and consequently fertility rates have drastically dropped. As in India, this success is often overshadowed by accusations of coercion and human rights violations. Stories about the

persecution of women who have too many children as well as reports of widespread infanticide and child abandonment alarm many human rights organizations, which have criticized the program as too strict.

Furthermore, the success of the program has led to new demographic problems. Chinese families traditionally prefer sons to daughters, and the strict family planning policy has made this son preference more obvious. Under extreme pressure to both have sons and limit the size of their families, many couples have resorted to infanticide, sex-selective abortions, and giving up newborns for foreign adoption. Consequently, the ratio of male to female children born is wildly uneven, and some demographers predict dire social consequences when this generation comes of age to marry. Another concern is the aging population. Those over age 60 are the most rapidly growing age group in China, and China's youths will face the burden of caring for them as they age.

The Abortion Issue

The recent conflict over abortion has been unsettling to societies across the globe. Intellectual and philosophical rationales abound in the United States as elsewhere, but the central question is simply whether or not women have the right to terminate unwelcome pregnancies. On one hand, many people—humanists as well as those with deep religious convictions—call themselves pro-life and argue that every human life is sacred. They support government prohibition of abortion based on their belief that society has an obligation to protect and defend innocent unborn children. Opponents of government in-

volvement, who refer to themselves as pro-choice, argue from both philosophical and practical perspectives. The theoretical position is that women must be able to control the use of their own bodies. Proponents sometimes cite Locke's assertion in *The Second Treatise of Government* that citizens own both their bodies and their labor unconditionally. In this view, the state has no inherent authority to legislate regarding a woman's right to make decisions pertaining to her fertility. Many pro-choice advocates are strongly motivated by the large number of deaths or permanent damage resulting from unregulated illegal abortions. Both pro-life and pro-choice positions are matters of deeply held belief; the controversy cannot be resolved by any empirical proof. Governments around the world have become involved, making decisions, passing legislation, and enduring legal challenges regarding the conditions under which women may terminate pregnancies.

For the greater part of Africa's post-Neolithic history, there has been an abundance of land and a shortage of labor. Female fertility has been seen as a source of wealth. From that historical background, it is not surprising that most African countries restrict abortion unless there is a serious threat to a woman's life or health. There are exceptions: Cape Verde, Tunisia, and South Africa have relatively relaxed laws regarding abortion, and Togo recently moved to extend legalization to instances in which the pregnancy is the result of rape or incest. Throughout Africa, in spite of government attempts to control abortion, it is certain that women have access to folk practitioners who take measures to end pregnancies, sometimes under less than ideal circumstances. We do not have dependable statistics about the impact of this on women's health.

The religious and philosophical traditions of Asia all place high value on life but tend to avoid becoming involved in political issues regarding the regulation of fertility. With some exceptions, abortion is now legal in much of Asia. Legality notwithstanding, it is a matter of great controversy in some areas, particularly in India and China, where abortion is often used to prevent unwanted female births. In the absence of national retirement plans such as Social Security, parents' long-term well-being depends on having

➤ RU-486 AND ABORTION

Known early in its test trials as RU-486, Mifepristone was developed in 1980 by the French company Roussel Uclaf. It was found to be an effective abortifacient (drug that induces abortion) in the first couple of months of pregnancy. Furthermore, it was found to serve well as an emergency contraceptive in small doses. Amid controversy, it was sold for the first time in France as Mifegyne. Its importation into the United States was banned by the administration of George H. W. Bush in 1989 but was later lifted by the Clinton administration after being approved by the Food and Drug Administration (FDA). Pro-life (antiabortion) groups throughout the West protested against its sale and use and continue to do so. While strongly advocated by pro-choice groups, pharmaceutical companies, and the medical establishment as a safe method for first-trimester abortion, the legalization of this drug throughout much of the world has continually stirred opposition and provoked controversy.

—Abraham O. Mendoza

sons to care for them. In both societies, female children are often considered an expense incurred for the benefit of a prospective groom's family since a woman is expected to contribute to the care of her husband's parents rather than her own. As of 1991, India had a ratio of about 945 women to 1,000 men, an imbalance that could eventually have unfortunate consequences. In an attempt to address the problem, many provinces have made it illegal for a physician to reveal the gender of an unborn child. In the early 1970s provinces across China adopted a one-child policy that strictly limited the number of children that couples were allowed but outlawed female infanticide. These acts specifically prohibited the murder, mistreatment, or sale of girl babies and their mothers but did not require that female fetuses be brought to term. As an additional complication, human rights activists have charged the Chinese government with forcing poor women to terminate pregnancies while allowing wealthy people to buy the right to second children by paying fines. Abortion has not

been as sensitive an issue in Japan, which legalized the procedure in 1948. Although there have from time to time been restrictions, it is now considered a woman's decision.

Russia was the first country to make abortion legal during the twentieth century. In 1920 Vladimir Lenin decreed that no woman should be forced to bear a child against her will. He framed it as a human rights issue, but it is probable that he was acting more to address the health issues caused by illegal abortions performed under unsanitary and unsafe conditions during the havoc of the revolution and civil wars. The policy was reversed in 1936 but reinstated in 1955. Other Eastern Bloc countries followed suit between 1955 and 1960. By 2007, when Portugal enacted a law allowing abortion until the tenth week of pregnancy, the procedure had become legal across most of Europe with the exception of Malta and Ireland, where the procedures are available only to save the life of the mother.

Most Latin American governments have made abortion a criminal offense, but there seems to have been a general relaxation in the past two years. In 2006 Colombia's highest court ruled that women could obtain abortions if a mother's life was in danger, if the fetus was not expected to survive birth, or if the pregnancy was the result of rape or incest. The region was hit with a shockwave in April 2007 when the legislature in Mexico City legalized abortion during the first 90 days of pregnancy. Both opponents and supporters of the new laws sounded much like their counterparts in the United States. Opponents contended that the ethical and moral framework of their society was under attack; supporters claimed that making medically safe abortions available would save women's lives. There are estimates that up to 5,000 women die each year in Latin America from bungled abortions. Notwithstanding the opposition of religious authorities, many Latin Americans are beginning to advocate that women be granted the right to terminate pregnancies under some conditions. Debates are becoming heated in Colombia, Brazil, Venezuela, Uruguay, and Argentina.

In the United States, the firestorm ignited by *Roe v. Wade*, the U.S. Supreme Court decision of 1973 that ruled most restrictions on abortion unconstitutional, still rages. As is the case with

other societies, the history of abortion rights in the United States has had many twists and turns. Many pro-life (antiabortion) proponents were alienated by the violence of a fringe minority of their movement. Alliances have not been straightforward or simple. The pro-choice position has been characterized as feminist, yet that in itself is an oversimplification. In recent years, many feminists have found themselves in the awkward position of being personally pro-life while philosophically pro-choice. In her article "Our Bodies, Our Souls," prominent feminist Naomi Wolf insists that "the death of the fetus is a real death." Many thoughtful feminists join her in refusing to accept a simple answer to a complex moral issue. Yet despite misgivings, few feminists are willing to have governments take the decision away from the women whose bodies are involved. Both sides agree that the solution is to prevent unwanted pregnancies but seem unable to find a compromise that protects both women and unborn children.

Birth Control, 1945 to Present

Birth control, in its varying forms, for decades has been at the center of ethical debates regarding morality and reproductive justice. In the late twentieth century, as new methods emerged, concerns came to the fore including potential health risks, disease, and population control, particularly in nations with large populations such as China and India.

During the 1950s there was increased interest in the United States to create an oral contraceptive for women. With the push of longtime advocate Margaret Sanger, biologist Gregory Pin-

cus produced the first effective birth control pill in 1957, but it was not made available to married women until 1965 with the *Griswold v. Connecticut* ruling, and not until 1972 with *Eisenstadt v. Baird* were single women given access to what is now commonly referred to as the Pill. While the Pill liberated women who had access to it from the fear and burden of unwanted pregnancies, in 1969 concerns about the potential health risks of the Pill surfaced, culminating in the book *The Doctor's Case against the Pill*, which helped to spur the Nelson Pill Hearings in 1970.

In France, tensions have mounted in recent decades among its growing Muslim population. Social workers have introduced women to a range of birth control methods to give women reproductive control, but according to some scholars, these options have increased marital tensions by challenging traditional gender roles and thus undermining the male's authority in a traditionally patriarchal household. These tensions have manifested in an increased pressure on religious leaders to ban the use of birth control, but Muslim religious leaders have not come to a consensus about whether or not forms of birth control are doctrinally acceptable. There are those who support the use of contraception by asserting that Islam emphasizes that children must be treated well and that to have more children would mean that they could not financially provide for their family.

Religious doctrine and birth control is also a point of contention within the Catholic Church, but this does not mean that birth control methods are not practiced by Catholics. The Catholic Church encourages couples to practice the rhythm method, but it has proven to be highly ineffective in preventing unwanted pregnancies. Some priests supported their parishioners' use of the birth control pill, but Pope Paul VI officially declared in his 1968 *Humanae Vitae* that the Pill directly countered Catholicism's stance on reproduction. The consequence of this debate has been that lay Catholics make individual decisions on this matter, undermining the authority of the pope, particularly in the United States and Western Europe. Other forms of birth control are also restricted by the authority of the pope, including the use of condoms. As HIV and

➤ IN VITRO FERTILIZATION

In Vitro Fertilization (IVF) was first successfully carried out in 1978 with the birth of Louise Brown in England. The process allows infertile individuals the chance to conceive by fertilizing an egg in a Petri dish and then incubating the embryo for up to 18 hours. The practice has been heavily criticized, however, as there are debates over who has access to IVF and who is deemed worthy to reproduce.

IVF is available worldwide, although there have been attempts in nations such as the United States, Italy, Egypt, and Sweden to limit the availability, with religion often at the center of the debate. For example, in Egypt, some leaders of the Islamic faith have argued that IVF is unnatural and therefore against Allah's will. Similar arguments have been made by Christian groups in the United States and Europe, with attempts to pass legislation that would make legal access to IVF more difficult.

The majority of people who undergo IVF are upper-middle-class individuals. Those who are not financially well-off do not have access to the expensive procedure, making IVF a primarily elite practice. In addition, whites are more likely to undergo IVF, which some have argued perpetuates a hegemonic racial structure that values whiteness over other racial and ethnic groups. These issues have led to the conclusion that governments should be involved in regulating and funding IVF to avoid inherent inequalities in the free market system.

Feminist scholars have also critiqued the free market system's relation to IVF, arguing that women's bodies and reproduction are being commodified. In addition to these critiques, some feminist scholars have suggested that IVF is a manifestation of a patriarchal structure that primarily values women as mothers. They argue that if a woman is unable to become a mother, she is placed in an inferior social position, putting a great deal of pressure on women to reproduce.

—Janiene Langford

AIDS continue to take a devastating toll in Africa, the Catholic Church has increasingly faced international criticism.

The female condom, first on the market in the late 1980s, has become an option for contraception in more than 90 countries and has often been touted as a way to protect women from

both pregnancy and disease, especially in situations where women are unable to convince male partners to use a male condom. In Africa in countries such as Zimbabwe, Nigeria, and South Africa, health care providers have argued that female condoms can significantly slow the rate of HIV/AIDS transmission, but distributing and convincing people to use this form of contraception has proven to be challenging. To counter resistance, governments and nongovernmental organizations (NGOs) have worked to educate people on the benefits of the female condom, and its use is increasing globally.

Beginning in 1981, the U.S. government started funding what is known as abstinence-only educational programs under the Adolescent Family Life Act (AFLA), referred to in popular discourse as the Chastity Act. Leaders of the Christian Right were concerned that access to birth control had created an immoral culture in which people could have sex with multiple partners without repercussions. The stated purpose of the abstinence-only programs was to prevent teen pregnancy and the spread of sexually transmitted infections (STIs) by promoting abstinence. Some argue that abstinence-only education is ineffective, as the majority of Americans do not abstain before marriage, but proponents maintain that sex education promotes premarital sex. In 1983 the American Civil Liberties Union (ACLU), in conjunction with other organizations including clergy members, sued the AFLA, claiming that it was violating the Establishment Clause of the Constitution, blurring the lines between church and state. After ten years of litigation, it was finally determined that the AFLA could function but could not use Christian rhetoric to promote its goals of abstinence education.

As concerns about the sustainability of natural resources and increasing evidence of climate change enter into global discussions, population control has come to the fore of debates, as it did during the early phases of the environmental movement.

Gay Marriage Controversy

The ongoing controversy over gay marriage is often the result of a traditional interpretation of Scripture that regards homosexuality as a sin and a choice as opposed to what many in the scientific community believe is genetic, a trait one is born with. In the United States as in countries such as Uganda and Saudi Arabia, the religious view that homosexuality is immoral has been the dominant one. However, since the onset of the gay rights movements of the 1970s, in many areas of the world attitudes and laws have extended increased civil rights to homosexual and lesbian couples.

Although tolerance toward gay people has increased since the 1970s, resistance to marriage equality remains in many countries. In 1996 the U.S. Congress passed the Defense of Marriage Act (DOMA), which stated that at the federal level the government only recognizes marriage as a union between a man and a woman, even if a given state allows it. Many state legislatures followed with their own version of DOMA. But a few states showed support for their gay citizens. In 1993 Hawaii's Supreme Court concluded that

it was unconstitutional to prevent same-sex marriage, but then the state legislature passed a 1998 law banning such unions, and the state court rendered its earlier verdict moot.

In July 2000 Vermont became the first state to allow same-sex couples to legalize their relationship, passing a civil union law. Civil union gives same-sex couples in that state some of the legal rights of marriage. In 2004 Massachusetts became the first U.S. state to give same-sex couples full marriage rights. In June 2008 a second state, California, also began allowing same-sex marriage; however, in November 2008 after a bitterly fought campaign, California voters passed an initiative that banned further gay marriages. Arizona and Florida also passed bans of same-sex marriage, and Arkansas banned gay couples from adopting or being foster parents. Nevertheless, by 2008 two more states offered civil union—New Jersey and New Hampshire—and Connecticut's Supreme Court ruled that gay couples did have the right to marry.

Such legislation in the United States appeared later than in several European countries. In 1988 the Netherlands was the first country to establish civil unions, followed by Denmark in 1989 and Norway in 1993. France has allowed civil union since 1999, while Germany has allowed it since 2001. Europe also led the United States in permitting same-sex marriage. The Netherlands moved from civil union to full marriage rights in 2001. Belgium began allowing same-sex marriage in 2003, while both Canada and England made same-sex marriage legal in 2005. The surprise was Spain. Known as a predominantly Catholic country, it still decided to permit same-sex marriage in July 2005. But throughout Latin America, the Catholic Church has been staunchly opposed to even civil unions. A few exceptions have occurred; in the city of Buenos Aires, Argentina, for example, civil unions have been permitted since late 2002.

Another country that is tolerant toward homosexuals is South Africa, which wrote protections for gay men and lesbians into its constitution and started allowing same-sex marriages in late 2006. But most African countries do not share that view. More typical is Uganda, where being convicted of homosexual conduct can result in life in prison.

➤ CIVIL UNION VERSUS MARRIAGE

In 2000 Carolyn Conrad and Kathleen Peterson made history in the United States as the first couple to legalize their relationship under Vermont's Civil Union law. But civil union only gives same-sex couples some, not all, of the rights accorded to married people. In a civil union, couples can file a joint state income tax return, making them eligible for tax benefits. But because of the Defense of Marriage Act, they must file their federal income tax as single people and pay higher taxes. Partners in a civil union are considered coequal parents if they have children and can gain decision-making authority if one partner is medically incapacitated. But they are not entitled to Social Security survivor benefits if one partner dies, nor are they eligible to receive a pension if one member had been in the military. And with few exceptions, civil unions are recognized only in the state where they were performed, unlike heterosexual marriage, which is valid across state lines.

—Donna L. Halper

Worldwide, gay marriage remains a divisive issue. In many countries, it is a moot point because homosexual conduct is still considered a crime. In addition to Uganda, in India homosexuals can still receive sentences from ten years to life if they are caught. In Saudi Arabia the penalty for convicted homosexuals is death. Iran has also applied the death penalty for people convicted of homosexual conduct.

In China homosexuals and lesbians are no longer persecuted, but neither civil union nor same-sex marriage is permitted. The same is true in Russia, where laws that once criminalized homosexuality are gone, but intolerance persists. And in Israel the civil unions of couples who had their ceremony in another country are recognized, but Israel itself permits neither gay marriage nor civil unions.

In the West and much of Europe, attitudes toward gay men and lesbians have become more welcoming, but in large portions of the world homosexuals are still shunned or imprisoned. Yet even in countries where being gay is against

the law, small advocacy groups work to change attitudes. The fight for gay rights and marriage equality will not stop any time soon.

■ Introduction: Cold War Culture

The onset of the Cold War in the late 1940s contributed to drastic cultural changes and political discourses the world over as a response to the potential threat of the "other" created by the ideological divide between the superpowers. The growing paranoia in both the West and the Soviet Bloc over internal enemies working from within triggered political witch-hunts, such as McCarthyism in the United States and the elimination of so-called class enemies from Soviet civil society who were shipped off to the Gulag. This concern also manifested itself in cultural forms such as film, literature, and public debates by politicians and intellectuals. Moreover, popular culture also reflected this paranoid atmosphere in movies about alien takeovers of humanity, in public interest in chess competitions (particularly Bobby Fischer's claims that the Soviets employed psychics to disrupt his thoughts during his match with Boris Spassky in 1972), in advertising that touted missile systems, and in myriad pronouncements about the relative comforts provided by the competing systems.

While often paranoid anticommunist discourse pervaded the domestic culture and society of the postwar United States and its North Atlantic Treaty Organization allies, anticommunism also shaped foreign policy. In its efforts to stem the growth of communism abroad, U.S. policy included supporting, installing, and propping up authoritarian pro-U.S. anticommunist regimes. This led to a growing resentment in much of the developing world toward the United States in what was seen as interference in their domestic affairs, creating a ubiquitous anti-Americanism

particularly after the Vietnam War debacle of the 1960s. This anti-Americanism would fuel resentment not only against U.S. military hegemony but also against what some groups (e.g., Islamists, Third World guerrillas, and European conservatives) interpreted to be corrupting social and economic influence by the United States on traditional values, mostly exemplified by its embrace of consumer culture.

The apprehension over internal enemies conspiring against society in tandem with the growing threat of nuclear annihilation also fueled other forms of societal anxiety in the West. These expressed themselves in myriad forms, such as the building of bomb shelters in suburbia, the institution of atomic bomb drills at elementary schools, and the very real fear of nuclear winter as expressed in science fiction films, comic books, and television shows, particularly in the United States. However, there were also currents of thought that expressly critiqued a free society that hampered civil liberties and supported foreign aggression. Existentialist philosophers, beatniks, and free speech activists were critical of the type of society that the Cold War was creating. They decried a loss of the very freedom in which the United States and anticommunists took pride in their campaigns against the Soviet threat. More definitively, the Vietnam War and the civil rights movements did much to illustrate the shortcomings of the United States both at home and abroad to a global community that was seething with resentment against the beacon of freedom and democracy.

—Abraham O. Mendoza

Consumerism and Mass Culture (and Critiques), 1945–Present

The term “mass culture” refers to media, events, and products consumed in similar or identical form by large (inter)national audiences. Forms of mass culture include advertising, network television, popular music, and the Hollywood film industry as well as built environments, branded goods, and consumer products. Some commentators see mass culture as a tool used by governments and corporations to keep consumers in a state of servile, ignorant bliss. For others, it is a democratic force that extends cultural participation to the majority. These conflicting perspectives emerge from distinct historical moments and describe a diverse and rapidly evolving phenomenon.

The 1944 GI Bill made university education, professional careers, and single-family homes accessible to millions of returning U.S. soldiers. To supply this market, new suburban developments, such as the 6,000-unit Levittown in New York, founded in 1947, were built using generic designs and prefabricated materials. Levitt and Sons applied Henry Ford’s principles of mass production to the highly personalized space of the American home. According to the sociologist David Riesman, these bland, uniform environments would shape equally homogenous inhabitants. Journalists and academics observing the new suburbia often critiqued a white middle-class culture driven by competitive, conspicuous consumption. The suburban lifestyle of the 1950s, with its green lawns, Tupperware parties, barbecue grills, and new-model Chryslers, has remained an enduring paradigm of consumer society.

Riesman and his contemporaries echoed the more far-reaching critique advanced by the Frankfurt School. Theodore Adorno and Max Horkheimer were Marxist intellectuals who fled Nazi Germany for America, where they continued to develop their critique of the culture industry. Their pessimistic analysis was informed by the propaganda campaigns of the European dictatorships and by their identification of a similar tendency toward authoritarian control in the United States. Adorno argued that American radio spoon-fed its message to passive audiences,

A picture-perfect suburban American family in the 1950s, often seen as a symbol of postwar mass consumerism. (Roberts/ClassicStock/Corbis)

leaving no space for imaginative or intellectual engagement. In this way, “The culture industry as a whole has moulded men as a type unfailingly reproduced in every product.” From a similar perspective, literary critic Dwight Macdonald condemned “masscult” as a parasitic, degraded imitation of “high” art, while other cultural analysts of the 1950s and 1960s identified psychological manipulation and brainwashing techniques in advertising.

Developments in the post-World War II era, most significantly the booming domestic economy and widespread access to broadcast television by the early 1950s, enabled American mass culture to expand its reach and power. While the Nielsen Ratings began to record eight-figure audiences, the corporate incursions into international markets facilitated by the Marshall Plan (1947–1951) led French communists to oppose so-called cocacolonization. Disneyland in Anaheim, California, opened its gates in 1955; Elvis

► THE KITCHEN DEBATE

On July 24, 1959, a model American kitchen, on display at the American National Trade and Cultural Exhibition in Moscow, became the site of a heated exchange between then U.S. vice president Richard Nixon and Soviet premier Nikita Khrushchev. The exchange, thereafter known as the Kitchen Debate, began as lighthearted banter between the two men but quickly developed into a heated political fray. Despite the ongoing arms race, the spontaneous debate between Nixon and Khrushchev focused primarily on consumer goods, many of which could be found in the model kitchen, and the quality of life under their respective forms of government. This underscored the fact that the rivalry between the two superpowers and their economic systems had become as much about the industrial output of automatic laundry machines as of nuclear missiles and military might.

Presley moved from Sun Records to RCA, first topping the Billboard chart with “Heartbreak Hotel” in April 1956; and McDonald’s established its franchise system in 1958.

While confirming many theorists’ fears, the expansion of mass culture in the latter part of the twentieth century was accompanied by new interpretations of its status. The countercultures of the 1960s appeared to signal a rejection of consumerism but also utilized and invigorated many of its forms. Pop artists Andy Warhol and Claes Oldenburg took a wry, playful eye to the ephemera of consumer society, offering screen-printed Campbell’s Soup labels and giant fabric hamburgers as works of art. Participants in the New Hollywood movement instigated by the countercultural classic *Easy Rider* (1969) later produced the first movies deemed blockbusters with *Jaws* (1975) and *Star Wars* (1977).

Since the 1960s, critics and cultural historians have been increasingly willing to approach forms of mass culture, from Bugs Bunny to professional wrestling to Tupperware, in less condemnatory and at times even celebratory terms. Emphasizing the “complexity of mass culture’s implication in social life,” scholar Janice Radway analyzed women’s engagement with mass-market

romance novels to show the ways that “real people can use the romance to address their unmet needs.” Reconceiving their subject as popular culture, such studies have emphasized the way that mass culture responds to the desires of audiences who, in turn, personalize and adapt these products.

Conservative commentators such as Allan Bloom vehemently opposed this shift in attitudes. The culture wars of the 1990s saw Bloom and his colleagues railing against a dumbed-down society saturated at every level by popular forms. In the same period, American mass culture reached truly global markets with a McDonald’s opening in Moscow’s Red Square, the launch of MTV Asia, and Starbucks aiming to operate 40,000 locations worldwide. International protest movements targeting corporate-led globalization argued that this represented an intensification of the cultural imperialism instigated by the Marshall Plan, eroding local cultures and creating a homogenous McWorld.

Like many other technological innovations, the Internet has fundamentally changed culture. The mediascape of Google, eBay, and YouTube seems far removed from the one in which 23 million Americans sat down on April 18, 1952, to watch the same episode of *I Love Lucy*. Fragmented and global, new media and new markets present a direct challenge to the existing theories and practices of mass culture and consumption.

Anticommunism in the West

It was British prime minister Winston Churchill, less than a year after the close of World War II, who effectively heralded the new reality of the Cold War between East and West in his epochal “Iron Curtain” speech. As Central and Eastern European states successively fell under Soviet influence, the Western response steadily hardened. The Truman Doctrine of 1947 announced a policy of containment that aimed to halt the further progress of Soviet expansion in Europe. The doctrine was supported by the development of the Marshall Plan later that year. Under its terms, the United States offered ailing European powers a package of aid and reconstruction to provide for their postwar recovery and thereby secure them against the spread of communism. The Soviet response was to establish the Warsaw Pact, which brought all 15 members of the Union of Soviet Socialist Republics (USSR) and its European satellite states into close political alliance.

One result of this bitter international standoff between East and West was that anticommunism became an important component of the domestic and foreign policies of the United States and its allies. Domestic anticommunism, however, had taken root much earlier. The U.S. Red Scare (1919–1921), which closely followed the Bolshevik Revolution, established the techniques of legal persecution and anticommunist propaganda later deployed during the Cold War. Formed in 1938 and supported by large sectors of the public and national press, the House Un-American Activities Committee (HUAC) quickly became the most powerful legal instrument in the postwar anticommunist crusade. The Senate’s Permanent Subcommittee on Investigations (PSI) became another particularly dangerous tool when its chairmanship fell into the hands of Senator Joseph McCarthy of Wisconsin.

The PSI, HUAC, and state-based un-American activities (or loyalty) committees worked simultaneously to discredit the reputations of prominent leftists and left-leaning liberals who had thrived during the prewar Popular Front against fascism and to root out communists from areas of contemporary public life such as the U.S. Army, the U.S. government, education, and the

➤ DR. STRANGELOVE AS ANTICOMMUNIST SATIRE

The American obsession with science emerged in the 1950s alongside anxiety about Soviet power and the possibilities of nuclear war. Stanley Kubrick’s *Dr. Strangelove or: How I Learned to Stop Worrying and Love the Bomb* (1964) is a satire that inspects the insanity of the nuclear age. The premise centers on an air force general who takes it upon himself to enact a virtually irreversible command to attack all Soviet military depots with nuclear weapons. His justification is that he believes that the Soviets are responsible for adding fluoride to water, sugar, flour, fruit juice, and ice cream to infiltrate and impurify Americans’ “precious bodily fluids.” The film ends with the pilot of one bomber, Major “King” Kong, astride a nuclear bomb whooping like a cowboy as it falls toward a target in the Soviet Union to bring on Armageddon.

—Kelly Detrick

entertainment industry. While HUAC hearings became media events, during the Truman administration the Federal Bureau of Investigation (FBI) also quietly began to perform background checks of all federal employees, in the process discharging homosexuals, for example, as security risks. This process of persecution characterized the early years of the Cold War in America. These investigations further traumatized a public concerned about the East-West arms race and the possibility of nuclear annihilation.

As the Soviet Union actively repressed liberalization efforts in its satellite countries and Khrushchev made public details of Stalin’s purges, anticommunism gained further intellectual respectability. Numerous Western intellectuals denounced their previous affiliations with communism. Most notable perhaps was *The God That Failed* (1949), an anthology of essays by authors including Arthur Koestler, Stephen Spender, Andre Gide, Ignazio Silone, and Richard Wright that chronicled each author’s youthful romance with communism and eventual disillusionment and repudiation.

As the 1950s drew to a close, the public fervor of anticommunism subsided slightly. This was partly a result of the emergence of more

moderate leaders such as Nikita Khrushchev and John F. Kennedy. However, although traditionally seen as a period of relative détente in superpower relations (paralleled by the domestic growth of the New Left), the later 1960s and the 1970s also saw the retrenchment of international antagonism and the fighting of proxy wars in contested regions in the Third World. While continuing their campaign against homegrown radicals and communists, dedicated cold warriors in the U.S. government now redeployed tactics of subversion and counterintelligence in a new international context with the aim of undermining communist or leftist governments around the world.

This process continued into the early 1980s, when there was a return to the acute tension of the early Cold War era. Perceiving the threat from the Communist Bloc to be greater than ever, the United States began developing Cruise missiles and the Strategic Defence Initiative (or “Star Wars” antimissile systems) and engaging in renewed counterinsurgency to combat Soviet expansionism.

The so-called Second Cold War was short-lived. The impetus behind the West’s anticommunist strategy was removed at a stroke with the ascendancy of Mikhail Gorbachev in the mid-1980s. Gorbachev immediately liberalized the Soviet economy, reduced its military expenditure, and reengaged with the West. Under these new conditions of freedom, known as glasnost (openness), the Soviet Union began to fragment. This was best symbolized by the collapse of the Berlin Wall and the eventual defeat of the Russian Communist Party after 73 years in power.

Above all, the Cold War ended in ideological and political defeat for Soviet-style communism. After decades of internal dissent and open conflict with the West, the communist edifice was finally destroyed from within. For many in the West, these dramatic events confirmed that their anticommunist stance had indeed been correct all along. However, the so-called victory of anti-communism was not global. Marxist-derived ideology and practice maintains its grip on countries around the world to this day, most notably China, North Korea, Cuba, and other Latin American states, even if it is increasingly expressed

in a more general attitude of anticapitalism or anti-Americanism.

Anti-Americanism

Anti-Americanism can be defined as an ideology expressing opposition or even hostility to the United States, its culture, its people, its government, or its policies. However, a broad range of attitudes and actions critical of or opposed to the United States cast across a wide spectrum characterize variants of anti-Americanism, from a French newspaper editorial critical of U.S. foreign policy to an Islamic terrorist blowing up a U.S. military installation. The most overt current examples of anti-Americanism reflect opposition to U.S. foreign policy, although there are various other more indirect forms of anti-Americanism that pervade the modern world (antiglobalization, anti-McDonald’s, antigenetically modified foods). Various world regions have unique forms of anti-Americanism based on their relationship with the United States. In light of U.S. military projection abroad and increased globalization, anti-Americanism is prevalent throughout much of the world.

European anti-Americanism since the end of World War II is characterized by hostility against American cultural influence in Europe as well as

resentment of America's rise in status to a global superpower concurrent with Europe's declining importance in world affairs. Following 1945, with the infusion of American occupation troops scattered all over Western Europe (leading some Britons to popularize the quip "overpaid, oversexed, and over here" in reference to American GIs), Marshall Plan aid, and the influx of U.S. consumer goods, many elite Europeans began to resent this presence of what they considered an inferior culture, leading some critics to suggest the so-called coca-colonization of not only developing nations but also Europe by the United States. Over the course of the latter half of the twentieth century, the growing U.S. global role and its control of the world economy led to increased diplomatic conflict in Europe. In the 1960s French president Charles de Gaulle removed France from NATO command in response to what he viewed as American infringements on French foreign policy, requesting the removal of American forces from French soil and initiating a French nuclear weapons program. In a similar vein, from the 1960s to the 1980s many Europeans had been overwhelmingly in opposition to U.S. Cold War foreign policy. The results range from protests against the Vietnam War to demonstrations against President Ronald Reagan's attempt to place Pershing II missiles in Western Europe. In spite of their initial support for the United States after the terror attacks of September 11, 2001, many European nations also have been critical of the U.S. position in the Middle East, particularly in regard to its support of Israel and in its unilateral approach to the Iraq War. Some Europeans have also fervently demonstrated against U.S. genetically modified food (perhaps illustrative of some of the irrational aspects of anti-Americanist fears of U.S. cultural hegemony) among other facets of American consumer culture (such as the famous 1999 incident in which French farmer José Bové dismantled a McDonald's in France), which they deem as intrusive to European cultural norms. In blaming the United States for globalization and an overly aggressive foreign policy, correctly or not, European anti-Americanism is characterized by its opposition to American foreign, economic, and cultural policies in Europe.

➤ STEICHEN'S *THE FAMILY OF MAN* EXHIBIT

Edward Steichen (1879–1973), director of the photography department at the Museum of Modern Art in New York City, loved grandiose, thematic exhibitions. "The Family of Man" exhibit of 1955 was his greatest project. His previous exhibitions "Road to Victory" (1942) and "Power in the Pacific" (1945) attracted unheard-of audiences because of their dynamic presentation. Photographs of all different sizes, as big as 10 by 40 feet, juttied out and clustered together and involved the viewer in a pictorial essay. For "The Family of Man," 6 million submissions were condensed into 503 photographs by 273 artists, known and unknown, from 68 countries. Most centered on family—parents, children, and lovers from every class and environment—and on the joys and sorrows and commonality of daily life. Some of the images also depicted crises and the workings of democratic institutions. Over the next eight years, the U.S. Information Agency organized shows of the exhibit in 37 countries in 85 shows, and roughly 9 million people saw it. No art exhibition had ever before been mounted on this scale.

"The Family of Man" conveyed a soothing message in the wake of the Korean War, the ongoing Cold War conflict, and McCarthyism. The exhibit's final photograph of a hydrogen bomb explosion underscored the necessity for cooperation despite Cold War tensions. The show's message, supporting an U.S. vision of democracy, social cohesion, and global cooperation, was carefully crafted. Many of the exhibit photos were cropped, enlarged, renamed, and otherwise edited to support the underlying message.

In the postwar period, anti-Americanism in much of the communist second world and the third world (sub-Saharan Africa, South and East Asia, and much of Latin America) has been characterized by the demonization of the United States as an economic neocolonial imperialist. Through its alleged manipulation of the World Bank and the International Monetary Fund, the United States is seen as imposing its will on the domestic policies of the developing world, as evidenced in the demonic portrayals of the United States in the 1980s during the Latin American

➤ ANTI-AMERICANISM AND 9/11

L'Effroyable imposture (The Horrifying Fraud) by French journalist and political activist Thierry Meyssan is a highly controversial 2002 conspiracy theory book on the September 11, 2001, terrorist attacks (9/11) and the alleged role of the U.S. government. The English edition is titled *9/11: The Big Lie*. The book's central argument suggests that the terrorist attacks of September 11 were self-inflicted on the part of the U.S. government in cooperation with the American military-industrial complex in order to provoke a reaction in support of its planned wars of aggression (War on Terror) against Afghanistan and Iraq. The book presents Osama bin Laden as a U.S. intelligence operative, made a scapegoat by the CIA. In addition, the book alleges that both the Bush and bin Laden families had much to gain from this endeavor, as both families' wealth management firm, the Carlyle Group, had much to profit in the aftermath of the catastrophe.

While the book has been a best-seller in France and much of Europe, it has also received severe criticism over its accuracy in both the European Union and the U.S. media. The U.S. government has denounced the book and has deemed it a source of misinformation regarding the event in question, harmful to the image of the U.S. government abroad. However, the receptiveness to the book in Europe illustrates the anti-American attitudes that existed in segments of European society at the time of the attacks. Nonetheless, numerous rebuttals of the book in the European press also show the complexity of anti-Americanism in Europe in that not all Europeans are willing to point the finger at the United States when something goes wrong in the world.

The fact that such conspiracy theories surrounding the 9/11 attacks are also popular on the Right and the Left in the United States further complicates the scenario. Depending on point of view, critics charge that such conspiracy theories indicate anti-Americanism within the United States or a healthy self-criticism within a political culture that values free speech.

—Abraham O. Mendoza

debt crisis. Cartoons in newspapers typically portrayed the United States controlling global affairs through banking networks and international finance organizations (i.e., tentacles). U.S. support for anticommunist dictators sympathetic to American foreign policy and economic aid and CIA assistance in overthrowing leaders seen as potential communists by the United States (Mohammad Mosaddeq in Iran, 1953; Salvador Allende in Chile, 1973; and various assassination attempts on Fidel Castro in Cuba) have also severely damaged the image of the United States in much of the developing world, creating further anti-American sentiment. Critics of globalization in these parts of the world are also prone to accusing the United States of being the agent and beneficiary of increased global economic interdependence. Both the Soviet Union (until 1991) and the People's Republic of China have done much to foster hostility against American foreign and economic policies in much of the third world, but the reality behind U.S. policies has sufficiently tainted the image of the United States abroad.

The continued U.S. support of the State of Israel also has done much to ignite opposition and hatred against the United States. Anti-Americanism in the Middle East is shaped by Islamic and Arab views on foreign intrusions on the lands of Islam by infidels but also by the legacy of colonialism from a previous era and the resentment felt against a renewed Western presence in the region, particularly that of the existence of the State of Israel. Israel is portrayed as a military appendage of U.S. interests in the region, which also includes the U.S. military presence in Saudi Arabia, Iraq, and Dubai. Both Arab nationalists (e.g., Gamel Nasser in Egypt, Saddam Hussein in Iraq) and Islamic fundamentalists (e.g., Ayatollah Khomeini in Iran, Osama bin Laden of al-Qaeda) have been critical of the U.S. military and economic presence in the region as well as the cultural influence damaging to the integrity of Islamic beliefs. In spite of the conflict between nationalists and fundamentalists in their visions of what should constitute the political makeup of the modern Middle East, both groups are largely opposed to the United States and its foreign, economic, and cultural policies in the region. Much like other critics of the United States,

Protest against the U.S.-led war in Iraq in Rome, Italy, on June 9, 2007. (Simone Ramella)

many of the leaders of Near Eastern nations also place the blame for globalization and its ramifications on the United States. The September 11, 2001, attacks on New York City and the Pentagon in Washington by fundamentalist al-Qaeda militants serve as reminders of the fanatical hatred of the United States found in segments of the populations of the modern Middle East.

Cold War Nuclear Anxieties

During the Cold War, anxiety about nuclear weapons reflected the fact that a nuclear-armed force could achieve, in seconds, destruction more complete and more widespread than a conven-

tionally armed force could achieve in months. The fate of Hiroshima showed that weapons available in the arsenals of the two superpowers could literally flatten cities, instantly kill hundreds of thousands, and inflict a slow death by poison on many of those who survived.

The most immediate source of anxiety after Hiroshima was the prospect that someday soon, the bomb would fall again. Those who saw nuclear war as a more intense form of conventional warfare worried that millions would die needlessly because they (or their leaders) had failed to make adequate preparations. Those who regarded nuclear war as qualitatively different than conventional war worried that it would bring the end of civilization, if not of human life. The first position was reflected in the policies of the Soviet and U.S. governments (both of which developed elaborate civil defense programs to calm such fears), in popular novels such as Pat Frank's *Alas, Babylon* (1959), and in films such as *Panic in the Year Zero!* (1962). The second and more widely held premise was promoted in novels such as Nevil Shute's *On the Beach* (1959) and Whitley Streiber's *Warday* (1984) as well as in films such as *The War Game* (1964), *The Day After* (1983), and *Threads* (1984).

The concept of deterrence, on which peace in the nuclear age has depended, assumes that nuclear weapons are controlled by rational leaders who will act in their nation's best interests.

Scene still from British film *The War Game* (1964) directed by Peter Watkins. The film depicted the devastating consequences of nuclear war and the inadequacies of civil defense. (BBC/The Kobal Collection)

➤ BACKYARD BOMB SHELTERS

In response to fears of a nuclear attack, during the Cold War years many people in the United States built backyard or basement shelters for personal and familial protection in case of nuclear attack. These shelters were designed to afford protection against the effects of nuclear weapons and to provide a safe shelter and supplies for a specified period of time after the attack. Initially they were called bomb shelters, but after thermonuclear weapons were developed in the mid-1950s they were more commonly referred to as fallout shelters.

There were two peak periods of shelter construction in the United States. The first was after the Soviet acquisition of nuclear weapons in late 1949. This led to a surge of interest in backyard bomb shelters. The second shelter craze was in response to a speech to the nation by President John F. Kennedy on July 25, 1961, during the Berlin Crisis. Kennedy committed new funding to national civil defense and advised Americans to construct shelters in their homes in order to be prepared for nuclear attack.

By the late 1960s the construction of fallout shelters declined markedly. This was due to several factors: most importantly, once the test ban treaty in 1963 moved testing of nuclear weapons underground, the actual fallout present in the atmosphere from nuclear testing declined. Other events such as the civil rights movement and the Vietnam War began to displace fears about nuclear war. Furthermore, there was a growing public awareness that fallout shelters would be futile in the face of the ever-increasing size of nuclear weapons and the nuclear arsenals

Mock-up of a properly outfitted family fallout shelter, about 1956. (National Archives and Records Administration)

of the superpowers. After the end of the Cold War, fallout shelters often were seen as quaint cultural artifacts (one is recreated for a display in the National Museum of American History in Washington, D.C.), and many were converted to more practical uses such as wine cellars and storage areas.

—Robert A. Jacobs

Bibliography

Kennedy, John F. "Speech to the Nation, July 25, 1961." In *Papers of the President, 1961*. Washington, DC: U.S. Government Printing Office, 1962.

Rose, Kenneth D. *One Nation Underground: The Fallout Shelter in American Life*. New York: New York University Press, 2001.

The possibility that rational control might break down therefore has been a potent source of anxiety in its own right. Many of the best-known cautionary tales about nuclear war rest on just this premise. The nuclear attack in *Fail-Safe* (novel, 1962; film, 1964) is triggered by a simple mechanical malfunction. The one in *Dr. Strangelove* (novel, 1959; film, 1964) is the work of a deranged U.S. Air Force general. *Colossus* (novel, 1967; film, 1970) imagines that the superpowers entrust their nuclear arsenals to intelligent supercomputers, which then form an alliance and

pursue their own agenda. *Gadget* (novel, 1977) features terrorists who kidnap a physicist and force him to build a nuclear bomb. *Crimson Tide* (film, 1994) deals with a missile-carrying submarine and a garbled message that may or may not be an order to launch a nuclear attack. All five causes of irrational nuclear war—malfunction, madness, computers, terrorists, and simple confusion—have been revisited many times since in novels, films, and think tanks.

The ability of radiation to poison and deform has been a third source of anxiety. This concern

reached its peak in the 1950s, when both the United States and the Soviet Union conducted above-ground tests of nuclear weapons. Concern over the effects of nuclear fallout—with high levels detected hundreds of miles away from test sites—led to political campaigns for a ban on atmospheric testing, which was signed in 1963. Similar concerns spawned a string of B movies about giant monsters created by nuclear testing, which began with the U.S. production *The Beast from 20,000 Fathoms* (1953) and the Japanese classic *Gojira* (1954), also known as *Godzilla*.

The broader health effects of nuclear weapons reemerged as a source of public concern in the 1980s, due in large part to the work of Australian physician and activist Helen Caldicott. The environmental effects of nuclear weapons first received wide attention in 1982, when Richard Turco and four scientific colleagues (including astronomer Carl Sagan) published a preliminary study of nuclear winter in the prestigious jour-

nal *Science*. Journalist Jonathan Schell's *The Fate of the Earth* (1982), first published as a series of articles in the *New Yorker*, described the devastating consequences of a nuclear war and also became widely influential.

After the collapse of the Soviet Union, the medical and environmental concerns about nuclear weapons diminished along with fears of a general nuclear war. Fears of what nuclear weapons could do in the hands of ruthless individuals have not only persisted but grown.

■ Introduction: Consumerism

Depending on an individual's perspective, consumerism can be described as one of the main organizing principles of economics and culture in the postwar period or as an example of a spreading virus killing off local cultural practices. Consumerism, or an economic system geared less to production and more to services and the stimulation of desire (and hence to consumption), is a critical element of twentieth- and early-twenty-first century social trends. Philosophers refer to the postmodern syndrome in which signs and signifiers circulate via advertising and media and create their own reality and demands. Appearances and attempts to conform to impossible ideals of youth and vitality are everything, as are versions of self-fulfillment based on acquisition, status, and therapeutic regimens. Consumerism implies the commodification of wider realms—including the domestic sphere, play, leisure, and the individual body—as men and women spend billions each year on plastic surgery and cosmetics. At venues from Disneyland to the proliferating shopping

mall, shopping has become an entertainment medium. Consumerism has also encountered a backlash as the mainstay of globalization and what some would call its substitution of an ersatz reality for traditional culture, customs, and beliefs. Seemingly a many-headed hydra, consumerism circumvents its own critiques, as in the selling of so-called cool or green products, and offers its own cures. For example, new media such as interactive software and social networking Web sites allow for progressive possibilities, as individuals can circumvent the limitations of their own neighborhoods, bodies, gender, and delimited identity during interactions in cyberspace.

—Fred Nadis

Advertising

The advertising industry, which aided the steady advance of consumerism throughout the twentieth century, remains a key component of globalization. Most developed or developing nations, from Hungary to New Zealand to Brazil, have

➤ ONLINE ADVERTISING—POP-UPS, SPAM, AND BROWSER ALGORITHMS

With the advent of the Internet in the 1990s, advertisers capitalized on new online technologies to market their wares and services so as to profit from the exponentially growing number of Internet users. In addition to the existing advertising on individual Web pages, the pop-up advertisement became a fixture of online advertising. Such pop-ups open as a new window when someone visits a certain Web page on their browser. Being forced to handle unwanted pop-ups annoyed Web surfers, particularly pop-ups designed to attain private information from people's computers, popularly known as phishing. As a defense, browser manufacturers developed pop-up blockers. On a similar path, spam (unrequested bulk e-mail), which early on was a way to advertise goods and services, eventually became a way for online criminals to gain details of people's identities, commit fraud, and steal valuable information. However, a more legitimate and convenient form of advertising, the browser algorithm, with which companies such as Google and Yahoo can match advertisers to users' interests as they make certain searches on their browsers, also has emerged as a mainstay in online advertising.

—Abraham O. Mendoza

advertising industries whose techniques reflect different cultural norms. Worldwide, advertising has evolved alongside such postwar developments as the Cold War, consumerism, postcolonialism, the youth revolution, and the hybridization of regional and global cultures.

Following World War II, while war-shattered industrialized nations, particularly Europe and Japan, experienced a period of scarcity reflected in advertising strategies, the United States gained unprecedented wealth and abundance. This abundance was reflected and encouraged in advertising. The postwar United States saw the advent of the style that design historian Thomas Hine has dubbed *populuxe*, based on the words “popular” and “luxury.” Inflated but useless tailfins on automobiles were one example of a vaguely space-age look heralded in advertisements along with visions of suburban bliss and

plenty. The *populuxe* look was mixed in magazines with public relations advertisements from aerospace corporations announcing missile systems that established authority for these manufacturers in the subdued climate of fear that the Cold War engendered.

In that same era, faced with a war-damaged infrastructure, the well-developed West German advertising industry was offering more subdued imagery than advertisers in the United States. In the late 1940s West German ads touted the value of the Marshall Plan for Europe, and by the early 1950s West German advertisements could insist on the long-term economic value of large purchases of items such as washing machines. By the late 1950s, reflecting the so-called economic miracle, even West German advertisements were urging frivolous purchases of luxury goods.

One of the first New Wave advertising campaigns of the 1960s came from German car manufacturer Volkswagen. Its Beetle was contrasted to the bulky luxury vehicles of the 1950s as a sensible, fun alternative. Instead of idyllic images linking an automobile to style or status, these ads relied on humor, irony, and the self-deprecating motto “Think Small.” PepsiCo also, somewhat fortuitously with its “Pepsi Generation” campaign, became one of the first companies whose advertising encouraged what is now called hip consumerism. With some risk, PepsiCo connected the Pepsi Generation to the burgeoning counterculture. PepsiCo, as did Levi’s and other companies soon after, absorbed the counterculture by affirming youthful rebelliousness as a selling point. The 1960s also saw the establishment of such global advertising icons as the Marlboro Man. This penultimate American cowboy and symbol of rugged individualism is still plastered on billboards around the world. New corporate logos for multinational corporations also became common in the 1970s, with streamlined fattened letters without hard edges that announced power.

By the late 1950s and 1960s, advertising also was reflecting the realities of anticolonialism and efforts to establish neocolonial ties. During colonial periods images of the colonized in subservient roles—complementing empire or providing raw products (such as tea or cocoa beans)—were common in British advertising. In the late

1950s and 1960s, as Britain was losing its hold on its colonies, advertising took up the cause of modernization in the developing world to suggest new neocolonial possibilities. Companies linked their efforts to new development projects, such as new hydroelectric dams (“Power for Uganda”) or Shell Oil’s chemical division’s benefits to agriculture in Cameroon. New images of middle-class Africans in Western garb and at the gas pumps, as opposed to colonials in subservient roles, had a vogue.

With the fall of communism throughout the former Soviet Union, advertising, previously at the service of socialist states, now shifted to private firms with corporate clients. Prior to the collapse of the Soviet Union, East German advertising, for example, did not highlight or fetishize products or rely on erotic overtures but instead underlined positive social outcomes; these product ads ran alongside public information ads that urged hygiene, nutrition, temperance toward alcohol, or products such as camping equipment to encourage healthy lifestyles. Following the collapse of the Soviet Union, East Europeans in general were eager for Western products and brands. Advertising followed. Whether such audiences—suddenly flooded with choices—needed an education first was widely debated in advertising circles. Incongruous ads, such as a television advertisement showing a person walking down a beach holding a large pack of Wrigley’s gum, were successful in Hungary (a country without beaches). Advertising campaigns for affordable Western products such as Snickers candy bars—appearing one year on almost every billboard in Moscow—were hugely popular. Yet such ads also generated a backlash as the infatuation with the West withered under the rule of Vladimir Putin. In 2000, for example, Putin insisted that he would not allow his campaign speeches to air between ads for Snickers and Tampax, as had Boris Yeltsin.

In India, an emerging industrial giant, global advertising often intermixes with regional cultures and languages. Advertising has even penetrated rural India on simple media such as wall signs painted on buildings that might feature logos such as “Pepsi” or “Whirlpool,” mixing English with Hindi, evidence of the meeting of the global with the local to create the so-called

glocal, a term used to describe regional hybridization and customizing of global services or products, including fast food. National and global advertisers have also found new audiences in the countryside of India with the advent, in 1987, of “video vans”—vans equipped with large video screens that project films and advertisements or receive satellite feeds. The video vans have become important fixtures in political campaigns and continue to draw the attention of regional and global advertisers.

Big Box Stores

The enormous discount merchandise outlets referred to with the names “big box retailer,” “superstore,” or “category killer” emerged as a retail species in the 1970s. By the early twenty-first century, large chains such as Carrefour, based in France, and Wal-Mart, based in the United States, as well as other box stores had become the world’s leading retailers. The name “big box store” describes these stores’ stripped-down aesthetic. They look like big boxes, or warehouses. They are windowless and come with few amenities, offering customers little in the way of service or delivery. Instead, they depend on high-volume sales on a small profit margin to offer customers low prices, so low that small stores often depend on them as wholesalers. As of 2006, Wal-Mart was the largest of these chains, with 2 million employees worldwide in 6,775 stores generating \$349 billion in sales. In the United States the emergence of suburban power malls that feature a cluster of these huge

➤ GREENWASHING OR NEW PARADIGM?

Given the controversy over the ubiquitous nature of box stores in much of the West—as well as in the Near East and Asia—there have been major efforts by global chains such as Wal-Mart, Home Depot, and Costco to adopt a more eco-friendly attitude in their business plans. In particular, Wal-Mart has made significant changes to the layout, architecture, and energy provisioning of some of its stores as well as stocking green products in an effort to change its image. However, critics allege that such attempts are corporate greenwash meant to draw attention away from the harsh business practices that these stores rely on, which might include labor abuses, the undercutting of small competitors, and buying from offshore sweatshops. Nonetheless, the embrace of green technologies can change how consumers view box stores.

—*Abraham O. Mendoza*

box stores has seriously eroded the customer bases of the more standard enclosed mall and has added further to the deterioration of small town main streets, where family-owned retail stores, pharmacies, or other similar businesses were once the center of downtown. Now powerful multinational corporations, these global chains have gained much critical attention.

While discount retailing can be traced to the late nineteenth and early twentieth centuries when large retailers such as Sears Roebuck and Co. emerged, in the 1960s smaller-scale variety chain stores such as Woolworth's began to give way to discount merchandising outlets whose number and size increased throughout the following decades. Wal-Mart is a prime example. Its founder, Sam Walton, began by opening large discount stores in the rural southern United States in small town markets that larger chains ignored as unprofitable. By 1970 there were 32 Wal-Marts in the Southern states. By 1980 there were 276, and the figures rose steadily as the company opened new regional distribution centers and arranged stores within a 300-400-mile radius. Walton spent little on advertising and built efficient operations and high morale among workers. In the 1980s as its finances grew, Wal-Mart left behind its strategy of locating only in

small towns in the United States and instead began to add suburban locations outside major cities, vying with shopping malls and department stores. They also met competition from wholesale clubs such as Price Club, which required shoppers to purchase memberships and buy in bulk from its warehouse outlets. In response, Wal-Mart launched its Sam's Wholesale Clubs. Wal-Mart began its global expansion in the 1990s, opening stores in Puerto Rico, Mexico, Argentina, Korea, China, and Germany. With less initial success, Wal-Mart met competition from the French chain Carrefour by opening superstores that featured traditional Wal-Mart household goods, hardware, and clothing, with groceries added. Eventually Wal-Mart scaled down these 220,000 square-foot (20,500 square-meter) mega-stores, or hypermarkets, to the more easily negotiable Wal-Mart Supercenter at about half the size. By 2007 Wal-Mart had become the world's largest corporate employer, with 1.8 million employees. It also had 3,000 stores outside the United States, many of them following regional formats such as the Bodega Store in Mexico.

While Wal-Mart began by serving a rural market with customers with lower than average incomes, other box stores, from their inception, catered to more affluent shoppers. IKEA, featuring both catalog sales and enormous outlets, peddles a Scandinavian design sensibility to shoppers with upscale tastes in furniture and home furnishings. Based in Sweden, IKEA offered its first furniture catalog in 1955 and expanded throughout the 1960s, opening its first major outlet in Stockholm of nearly 495,139 square feet (46,000 square meters) in 1965. It continued to add stores throughout Europe and then in the 1970s added outlets in Australia and Canada, moved into the United States in the 1980s, and continued to expand to locations such as the United Arab Emirates in 1991.

While big box retailers have had remarkable growth since the 1970s, their appearance in a new community often breeds resentment. They are big and are considered by many to be environmentally unsound destroyers of smaller businesses, and because of their stress on high volume and narrow margins they tend to generate labor unrest. Many contradictory studies have attempted to determine the ultimate economic

benefits of such stores. While they add to the tax base of a locality and provide jobs, academics Roberta Grantz and Norman Mintz have documented the attack strategies of these businesses, first opening with a staff 50 percent bigger and prices lower than either will remain several months later when the store has attracted its business and damaged local competition. While Wal-Mart in its early decades prided itself on its harmonious management-labor relations and has continued to call its employees “associates,” it has in recent decades, along with other box stores, fought antiunionizing campaigns, weathered class action suits arguing that the company discriminated against female employees, and faced political opposition for supporting sweatshop labor in developing countries and China. In recent years, Wal-Mart has concentrated on promoting itself as an environmental leader, offering energy efficient products such as compact fluorescent light bulbs while also experimenting with more environmentally appropriate store designs, packaging, and procedures.

Shopping Malls

Unknown prior to World War II, shopping malls have since become one of the identifying features of global consumer culture. The shopping mall, which emerged as a feature of the suburban U.S. landscape in the 1950s, in its basic form is an enclosed, usually windowless and climate-

Designed by Victor Gruen, Southdale Center opened near Minneapolis in 1956. It was the first enclosed and climate-controlled mall. (G.E. Kidder Smith/Corbis)

controlled shopping center. The typical mall will have an enormous capacity for free parking; a food court featuring fast food versions of international cuisine; two large, prestigious anchor department stores; and an array of global outlets such as Gap, Starbucks, and the Body Shop. Since their remarkable global spread beginning in the 1970s, malls, which can be further categorized between local and regional supermalls, have often been critiqued as a challenge to democratic public space, as spaces where labor is exploited and consumer debt is encouraged, and as symbols of homogenized cultural experience. Malls can be found around the globe in cities such as Hong Kong, Osaka, Dubai, New Delhi, Singapore, London, Hamburg, and Moscow. The mall in recent years has been challenged, often globally, by urban pedestrian malls and the spread of newer no-frills box stores such as Wal-Mart, Home Depot, and Costco. Evidence suggests that at least in the United States, the building of malls peaked in 1978 and that the boom, as of 2007, was over; while many prospered, other older abandoned malls began to clutter the suburban and outlying landscape.

➤ ZOMBIES AT THE MALL

Director George A. Romero's *Dawn of the Dead* (1978) is an independent horror film that features a suburban shopping mall (filmed on location outside of Pittsburgh) taken over by zombies. A sequel to *Night of the Living Dead*, the film's premise is that an unknown plague has brought corpses back to life, creating zombies desperate to eat the flesh of the living that will also turn the newly dead into zombies. The film centers on several characters fleeing the plague who land in a helicopter on a shopping mall hoping to find supplies. The mall, unfortunately, has been invaded by the zombies who, to intentional satirical effect, engage in burlesques of shopping activities as they wander through stores and over an ice rink while groaning and mindlessly seeking out human prey. One of the still-human characters, Fran, asks, "What are they doing? Why do they come here?" Her companion answers, "[It is] kind of instinct. Memory. What they used to do. . . . This was an important place in their lives." When the protagonists drive the zombies from the mall, briefly, they also engage in a shopping spree that includes robbing a bank. Mixing graphic violence with cultural commentary, the film received some criticism for its violence and praise for its originality.

—Fred Nadis

Predecessors to the modern mall include the mid-nineteenth-century arcades built in Europe, including the Galleria Vittorio Emanuele built in Milan in 1867. This arcade, essentially two intersecting city streets of shops open only to pedestrians with elaborate tiled floors and covered with vaulted glass ceilings and glass domes, is still a highlight of downtown Milan. In 1923 the first shopping center designed for automobiles was built near Kansas City, Missouri.

The age of the mall really began with the Southdale Center, the first enclosed and climate-controlled mall that opened outside Minneapolis in 1956. Designer Victor Gruen advertised that "in Southdale Center every day will be a perfect shopping day." Architect and city planner Gruen, a Jewish refugee from Nazi Germany, became the apostle of the shopping mall and had great

hopes of the mall as a spur to community and culture and a solution to urban blight as well as an enticement to spending. His ideas were similar to those of the creators of the department stores in the late nineteenth century but pitched to the new cultural context resulting from the growth of suburbs and consumerism. Gruen designed his malls with features such as fountains and sculptures, no obvious exits, and no windows to ensure that people would feel themselves in a world apart, spend as much time as possible, enjoy themselves, and feel relaxed and happy to spend. Scholars have since dubbed the outcome of this design strategy, aimed at maximizing consumption, the Gruen Effect. Catering to the suburban automobile-centered lifestyle and encouraged by changes in tax codes, by the 1970s malls were commonplace throughout the United States. Reports from that era insisted that Americans spent more time in malls than anywhere besides their homes and workplaces. Even after the mall building boom ended, the enormous Mall of America, which opened in 1992 and combined a mall with an indoor amusement park and parking for 13,000 automobiles, still remains a major tourist destination in Minnesota.

In the late twentieth century enclosed malls became common in cities throughout the world. For example, the Lakeside Centre, outside London in Essex, includes 1.35 million square feet (approximately 93,000 square meters) dedicated to parking and shopping in the style of the suburban United States. Australian-owned mall giant Westfield owns various malls in the United States in addition to its home domestic market. Critics have argued that malls, aimed at the middle class, were a major aspect of a new architecture and urban planning, creating corridors of privilege that walled out the underclass. Malls were privately owned and were patrolled by private security forces. Many court cases in the United States indicated that mall management could limit free speech and curtail political leafleting. In developing nations such as Chile, scholars have argued that malls became symbols of modernity and part of a discourse of cleanliness, as the malls as well as office buildings and public transit system became part of a network linking clean middle-class spaces and blocking out the other (premodern and dirty) Chile.

Since 1988 the number of malls under construction in the United States has steadily decreased. As of 2007, many malls have either closed or feature empty retail spaces within. While the species is still hardy, it has suffered from competition from no-frills box stores such as Carrefour, Costco, and in particular Wal-Mart, which developed from a discount merchandising chain located in rural towns in the United States to the world's largest retailer by 2006. Likewise, the mall experience has lost its aesthetic appeal for many. The trend is toward less-homogenized malls and toward power malls that include a cluster of enormous box stores. Nevertheless, malled spaces in global consumer corridors such as transit stations, convention areas, and airports are an identifying feature of our age.

The Cosmetics Industry and Shifting Beauty Ideals, 1945–Present

Over the last half century and more, few industries have experienced the growth in profits and cultural influence as has the cosmetics industry. The industry established its financial footing during World War II in the United States. Magazine advertisements promoted makeup as a natural and essential part of American womanhood, and by 1948 an estimated 80-90 percent of women routinely used rouge and lipstick as part of their beauty regimen. New products such as foundation, smudge-proof lipstick, and liquid eye-

liner helped companies expand their female consumer base. Noxzema and Cover Girl targeted the youth market; Revlon positioned itself as the brand for sexy, sophisticated, and mature women; and Maybelline aligned itself with working-class women. The cultural influence of Hollywood icons such as Marilyn Monroe, Doris Day, and Rita Hayworth reinforced such types as the blond bombshell, the girl next door, and the exotic beauty as looks that ordinary women could emulate through the purchase of cosmetics, hair dye, and other toiletries. Meanwhile, entrepreneur Madam C. J. Walker continued to create products for African American women and pursued aggressive marketing campaigns in black-owned magazines such as *Ebony*. During this time, cosmetics companies also identified men as an untapped consumer market and designed products, packaging, and ads to combat cultural perceptions that deodorant and cologne denoted homosexuality or effeminate behavior.

In the late 1950s and early 1960s, activists in the civil rights movement began challenging the standards of female beauty in the United States. Beauty culture became politicized as the hairstyle known as the Afro and slogans such as "Black is beautiful" emerged as visible markers of racial, political, and economic protest against white beauty norms and the companies that promoted and profited from this limited ideal. The criticisms from the civil rights activists also fueled a burgeoning feminist movement in the late 1960s that criticized the cosmetics industry's objectification and commodification of women in the mass media and its profiting on women's insecurities.

Refining the marketing research techniques they had developed in previous decades, the cosmetics industry responded to these criticisms in the 1970s by marketing cosmetics as products that often invoked women's independence and self-worth, such as L'Oreal's famous "Because I'm Worth It" slogan. Many companies also expanded their product lines and included shades and "scientific formulas" for a variety of ethnicities and supported these initiatives with national advertising campaigns that included African, Asian, and Latina models. By the mid-1980s, most U.S. cosmetics companies embraced multiculturalism as a successful and profitable marketing strategy.

➤ PRACTICE OF SKIN LIGHTENING

In the non-Western world, the practice of lightening one's skin with chemical bleaches and/or herbal ingredients can be traced to a legacy of colonialism, where fair skin was often equated with a woman's beauty, virtue, and civility. In recent years, global cosmetics companies have capitalized on this legacy with aggressive advertising campaigns that market fairness beauty creams to nonwhite populations all around the world. With its expanding middle class and economic prosperity, India currently leads the world market in the consumption of commercial skin lighteners. Critics note that a desire to emulate the look of fair-skinned Bollywood actors, combined with a legacy of British colonialism, has proven to be a profitable and exploitable market for global cosmetics corporations.

—Lindsey Feitz

Spurred by the communications revolution in the late 1980s, many U.S. cosmetics companies expanded their overseas operations in Eastern Europe, Asia, the Middle East, and Africa, while French and Japanese brands such as Chanel, L'Oreal, and Shiseido became household names in the United States.

Meanwhile, criticisms launched by environmental and consumer rights groups during the 1970s resulted in mandatory ingredient labeling and also raised public awareness of animal testing within the industry. In recent decades, many cosmetics companies have also begun marketing products with “all-natural” ingredients to capitalize on increasing concerns about environmental issues. Yet the ongoing ideal of youthfulness has also led to a new range of products and procedures (such as plastic surgery and Botox injections) to those concerned with aging.

Youth Culture and Global “Cool”

According to the Oxford English Dictionary, the term “cool” has been used as an adjective for a calm and dispassionate state of being since the Old English epic poem *Beowulf* (eighth century CE). However, “cool” in its more contemporary meaning, as an adjective for something admirable, sophisticated, stylish, or classy, is an American concept and can be traced back to African American slang of the late nineteenth century. Jazz musicians of the 1930s gave a different shade of meaning to the term by using it as a description for anything relaxed or trouble-free along with an understated aura of courage and competence. By the 1950s “cool” became associated with anything or anyone avant-garde and ahead of the mainstream. It was at this point that the rise of the concept of a youth culture and the culture of cool converged.

The concept of cool accompanied the development of the youth market for consumer goods following World War II, as industries marketed to teenagers with teen-specific magazines, music, film, soft drinks, and clothing. *Seventeen Magazine*, Coca-Cola, Levi jeans, and Ray-Bans all helped to convey the attitude of cool. Over the decades, from the 1950s to the present, two main cultural shifts have redefined cool. First, rather than simply describing an attitude, cool is more often seen in terms of consumption and must-have items. For example, both a generic MP3 player and an iPod play music, but an iPod is cool. Second, the concept of cool, if historically American, has become a global phenomenon. This is most particularly true with the current generation of adolescents and young adults, frequently termed Generation M.

Generation M (“M” for “Media”) is one name journalists have applied to young adults born in the early 1980s through the early 1990s. Many factors differentiate Gen Ms from their predecessors. One of the most significant is that they are the first generation raised in an era of personal,

Teens, members of Generation M, text message on a cell phone. (iStockPhoto.com)

real-time, and near-constant electronic information sharing. Gen Ms are early adapters; they embrace and utilize new technologies and weave them into the fabric of their daily lives. Mobile phones, iPods, and iPhones are common accessories for teenagers and young adults worldwide. The constant connectivity that such technology offers has aided the creation of a global youth culture, and this community has already had an impact on culture, politics, and economics.

The rise of a global youth culture is easily traced to the rise of personal computers and the Internet in the early 1980s. It is important to acknowledge that a digital divide (lack of access to information technology) exists and represents a real problem, both economically and culturally, for many populations. However, on a global level, personal computing and connectivity via the World Wide Web are increasingly the norm for all areas of contemporary life including commerce, education, politics, and personal interactions (including romance).

In the early 1960s media critics, including Marshall McLuhan, began using the term “the global village.” In this global village, as McLuhan conceived it, humankind is united through technology. This unification had the potential for good (intellectual freedom) or evil (the rise of totalitarian governments). In the 2000s the globalization of popular culture among teens and young adults serves as evidence that the global village has emerged. The long-term effects of the

➤ RULE OF THUMB—TEENS, TEXTING, AND THE CULTURE OF COOL

Text messaging is a global phenomenon. Worldwide, adolescents and young adults have led the way in the use of this communication tool, so much so that the current crop of 13- to 24-year-olds has been termed by market researchers Generation M or Generation Text. Here are a few interesting facts about cell phone and text messaging:

- In 2007, globally, there were more than 2 billion cell phone subscribers.
- The telecommunication industry refers to text messages as Short Message Service (SMS). The first SMS is thought to have been sent in 1992 by employees at Logica CMG.
- The Philippines leads the world in text messaging. Statistics indicate that Filipinos sent well over 200 million text messages daily in 2006.
- In the United States, a 2006 survey indicated that 51 percent of young adults, aged 18 to 25, had sent or received a text message within the past 24 hours. Only 10 percent of adults aged 41 to 60 had done the same.
- Almost 70 percent of teens in Italy use their cell phones for social networking (including texting and sharing photos and videos), more than any other West European nation.

—Vibiana Bowman

global village on personal and intellectual freedom are yet to be determined, as electronic connectivity can also engender loss of privacy and aid efforts at surveillance. Yet the global village also can be seen in action as new trends in music, fashion, and consumer products circulate rapidly among the youth community worldwide, encouraging cultural hybridity and interaction.

Research in developmental psychology has established that the habits and attitudes formed in youth carry over throughout a person's lifetime. While the focus and locus of cool will change, the globally connected and techno-savvy youth culture that now is evolving will affect business and social communities for decades to come and continue to shape the modern sensibility.

MAORI TATTOOS

Tattooing was a practice of art and adornment for the Maori of New Zealand that declined with European colonization in the eighteenth and nineteenth centuries. The tattoo designs denoted status, tribal affiliation, family, and individual identity.

Moko (facial tattoos) were common among most Maori men and women. Men's whole faces were usually covered in tattoo design, but women usually had just one area of the face tattooed (chin, nose, lips, or forehead). In the nineteenth century, through the efforts of missionaries, the

Maori began to tattoo less and less. By the 1920s most of the Maori men who were tattooed had died, but tattoos on women continued until the 1950s. In the late twentieth century there has been a tattoo revival, and both Maori men and women are embracing this practice. Yet the older techniques of chiseling the tattoo into the body have been replaced with metal needles and electric machines. Those who now have a moko are seen as connected to the history of Maori culture. The moko now refers to any tattoo that reflects traditional designs. Modern primitive movements have appropriated their tribal designs, but the Maori reject this use of their tattoos.

—Kelly J. Baker

Maori chief adorned with the moko, the facial tattoo that graced both Maori men and women until European colonization in the eighteenth and nineteenth centuries lead to a decline in the practice. (Wilkes, Charles. Narrative of the United States Exploring Expedition: During the Years 1838, 1839, 1840, 1841, 1842. London: Wiley and Putnam, 1845.)

Body Modification

Body modifications are ancient tribal practices that have in recent decades become a practice of many Western and Westernized youths. Even older members of pop subculture groups have sought to express themselves using these ancient art forms. Body modification includes tattooing or inking of the flesh; piercing; branding; scarification, a practice originating in Africa in which the skin is cut to cause scarring; subdermal implants in which materials, most often metal, are placed under the skin; and earlobe stretching and other activities that change the body. Tattooing, piercing, and many of these practices have existed for centuries in African, Hindu, Native American, Polynesian, and other cultures' rituals, art, and conceptions of the body. Body modifications have served to mark membership in various communities, as with Maori tattooing, and have also functioned as a way to mark slaves and prisoners from antiquity until the nineteenth century (although World War II concentration camp inmates were tattooed with identification numbers). While the process of modifying the body remains a set of indigenous practices, many present-day modifiers in Western nations have adopted these tribal practices to connect with other cultures and to establish unique identities.

The introduction of body modification to Europe and America did not occur until the late eighteenth century with Captain Cook's journey to the South Pacific in which sailors embraced the tattooing of the peoples they encountered. Unlike the cultures in which it originated, body modification has a somewhat sordid history in Europe and America because it was associated with the working class, sailors, and prisoners. In the early twentieth century, tattooing became a

vehicle for many men in the working class to create communities, but by the middle of the century tattooing, particularly in the United States, became associated with subcultures, such as bikers, street gangs, and felons.

In the 1970s devotees of the punk rock movement, based in Great Britain, combined piercings, tattoos, and mismatched clothing to assert resistance to mainstream culture. In 1978 Fakir Musafar, a white Californian, began the Modern Primitivism movement, which promoted body modification, including tribal tattooing, flesh hangings, piercings, and other indigenous rituals, as methods to focus on the body's spiritual and communal possibility. Modern primitives such as Musafar's followers sought indigenous rituals to counter the perceived Euro-American alienation of the body. Indigenous groups have rejected the neotribal emphasis of the modern primitives as a form of colonialism because of the appropriation of rituals without permission.

By the late 1980s body modification became a movement that included many different groups who began to identify themselves as body modifiers, including some feminists, members of the gay and lesbian sadomasochism communities, and participants in the New Age movement and the modern primitives. However, by the 1990s tattoos and piercings moved into the mainstream, and these modifications became popular among youths. In the twenty-first century, tattoos and piercings, regarded as expressions of self and identity, have become a staple in youth fashion, popularized by musicians and on MTV. Cyberpunks also have embraced body modification as a way to complicate ideas of natural bodies by using new technologies for modification, such as subdermal implants. Body modification has become far more mainstream, but it also remains an important part of the identities of various subculture members who rely on extreme modifications to separate them from the rest of society.

Electronic Developments and Entertainment

Tennis for Two, a simple game based on table tennis developed on an Oscilloscope in 1958 by Brookhaven National Laboratory's William Higginbotham, is generally regarded as the first video game proper. However, there had been mainly text-based computer games such as Noughts and Crosses (1952) earlier. In fact, the first electronic game-related patent, U.S. patent number 2455992, for the so-called Cathode-Ray Tube Amusement Device was applied for already on January 25, 1947. The impact of early games, however, was limited: no commercial consoles were built before 1972, and the circulation of computer-based games such as Spacewar! (1961) was hindered by the small number of computers, since mainframe computers, such as the DEC PDP-1 on which Spacewar! was programmed, were only available at large universities.

The first commercially successful video game, PONG—very similar to Tennis for Two—was not developed until 1972. Since then, however, video games (both console and computer games) have enjoyed an ever-growing popularity, only briefly upset by a 1983–1984 market crash in console games, resulting in the bankruptcy of many smaller firms. In the early 1980s the availability of home computers for private households (the best-selling Commodore 64 was released in 1982) diversified and increased the gaming scene. With better graphics and sound cards becoming available for personal computers, the software industry throughout the 1980s and in the early 1990s slowly shifted to machines originally developed mainly for office work.

The World Wide Web, which was opened to the public in 1993, created a new basis for

➤ VIRTUAL WORLDS

Until recently the most widespread online games were first-person shooters and strategy games. As of 2007, however, two other genres, especially among female gamers, have developed an immense popularity: massive multiplayer online role-playing games (MMORPGs) such as *Everquest* or *World of Warcraft* and online life simulations such as *Second Life*, *Dotsoul*, or some aspects of *Entropia Universe*. These games, set within computer-generated virtual worlds, give players the opportunity to develop an online persona (character or avatar). In other online games the variation between characters is at best limited to skins, that is, the modifiable in-game appearance of the character. In virtual world games, however, the impersonation of a character is a possible (MMORPG) or central (online life simulation) part.

The main difference between online life simulations and MMORPGs is that while the latter assign quests (jobs assigned to characters who guide the player), online life simulations are centered on the creation of a character, the programming of new items, or interaction with other characters, depending on the players' preferences.

The relative anonymity of the Internet gives the user the opportunity to construct any persona they wish to embody within certain limitations necessary for the game mechanism. In the more static variants the user chooses from a variety of characteristics including occupation, gender, appearance, race, and so on. In others the only limitation, as software manufacturers like to emphasize, is the user's imagination. In reality, of course, it would be more frank to also take into account the respective user's skill in handling the program, the program's source code limitations, and the time and money spent on the game (especially in virtual life simulations).

—Johannes Fehrle

national and international contact between gamers (people who play video games) and led to an ever-growing community. The latest big development in both computers and consoles are online games, where sometimes thousands of users can interact within the same game environment at the same time. Many video games can now

claim a devoted fan base who further promote games in the form of independent online forums and blogs (online journals) or by writing mods (modifications to the original source code of the game) and creating new maps for strategy games.

The reasons for the huge impact of video games are numerous and diverse. The software industry is a significant economic factor, with computer games becoming ever more complex and costly while sales figures continue to grow. According to a 2007 National Purchase Diary (NPD) Group press release, the total retail sales of video games in 2006 exceeded \$13.5 billion in the United States alone. In most industrial countries, more money is generated from video games than movies, leading critics to assume that games will be the dominant medium of the twenty-first century. In addition, the hardware-producing industry, especially in the PC branch, benefits from the ever-growing advances in graphics and the resulting hardware requirements. In fact, almost all of today's top-of-the-line computers are targeted toward gamers.

While video games, especially games with contents displaying sex or violence, remain controversial, they have developed momentum. Cultural icons or products originating in specific games (such as the character Lara Croft of the *Tomb Raider* series) are easily recognizable and frequently appear in other media. This influence reaches from cross-fertilization between video games and movies (Disney's *Tron* [1982] being the first feature film centered around a gamer), music, art, or books to the everyday use of neologisms originating in the Internet or gamer culture.

In addition, scientific research in game-related matters is increasing, ranging from inquiries into the impact that violence in games has on teenagers to reports about the benefits of gaming and the positive effects when used for educational purposes. According to 2005 Entertainment Software Association (ESA) statistics, the gender distribution of gamers in the United States was 55 percent men and 43 percent women. These figures are expected to slowly reach equilibrium as female gamers find genres that interest them. Gaming is a worldwide phenomenon with large gamer enclaves in Asia, especially in South Korea

and China where some pursue gaming as a profession, earning money in well-attended tournaments and from sponsoring or by mining (i.e., collecting virtual resources in an online game and selling them in the real world).

Even though professional gamers are not very common outside Asia, they can also be found in other countries. The German Ailin Gräf (aka Anshe Chung), who became a millionaire by selling virtual property in Second Life, is one famous example. This process of exchange of real world versus virtual currency, known as real money trading in game jargon, is the main source of income for software companies running virtual worlds games, many of which are provided free of charge and downloadable for all since the software companies own all unsold virtual land and can theoretically add new saleable items at will.

Disneyland and Global Theme Parks

When Disneyland opened in 1955 in Southern California, the park renovated the image of the traditional amusement park. As many critics and fans have since pointed out, unlike the carnival atmosphere of earlier amusement parks and their surroundings such as Coney Island, Disneyland offered a clean and safe haven for families. It was also an easy travel destination with its own freeway entrances and exits. Within its confines, Disneyland presented an idealized American past and, as in many of the world's fairs and expositions that it emulated, a romanticized vision of progress and the future. The consumer-entertainment model that Disneyland helped

Disneyland, a "themed" repackaging of earlier amusement parks, during a celebration of its 50th anniversary on July 17, 2005. (PRNewsFoto/Disneyland)

create is now common at tourist sites such as heritage shopping malls, hotel-casinos, restaurants, and tourist hotels and on cruise ship lines.

Walt Disney consciously crafted Disneyland as the antithesis of Coney Island and traveling carnivals. There would be no drinking, gambling, bawdy entertainments, price gouging, or pointless thrill rides. As at world's fairs, Disney sought to create displays and rides that would educate and entertain the masses. Patrons entered the park on Main Street, sauntered through an idealized American small town, and then proceeded through a fantasy castle to various lands: Tomorrowland, with its futuristic renderings; Adventureland, with its jungle fantasies; Frontierland, with its celebration of the American West; and Fantasyland, where Disney cartoon mascots roamed. The theme park was financed largely by ABC television, which also broadcast a weekly Disney television series that began its broadcasts nine months before the park's opening in 1955. The television series, like the theme park, offered nostalgic renderings of the past, as in its popular "Davy Crockett" episodes, as well as stirring visions of the future.

From the start, the television series and the park were a hit with the American public. In Disneyland's first seven weeks in operation, more than 1 million visitors came to the park. From its inception, Disneyland was recognized as akin to a national shrine. The park became so central to

➤ BARBIE GOES TOTALLY GLOBAL

Barbie, the Teenage Fashion Model, an American icon both exalted and derided, is a perennial favorite in the international toy market. Barbie is a true multinational. The story of her birth moves from America to Germany to Japan, back to America, and onto the worldwide stage.

Inspiration for Barbie came from Bild Lilli, an alluring German doll first produced in 1955. Ruth Handler, wife of Mattel Toy cofounder Elliot Handler, spotted Lilli on a European vacation. Handler, who had been developing an idea for the production of a new kind of grown-up-looking doll, immediately saw Lilli's potential and used her as a prototype. Mattel negotiated with a Japanese manufacturing company (Pony Ltd.) to mass-produce the toys, and in 1959 Barbie debuted at the International Toy Fair in New York.

To date, more than 1 billion Barbie dolls have been sold in more than 140 countries. Since the early 1960s, Mattel has customized the packaging and outfits for Barbie to reflect the language and culture of various countries where she is marketed (Barbie in bindi and a sari for India, for example). In 1980 Mattel began a line of International Barbies for American collectors that celebrate the national

character of various countries. To that end, the dolls are clothed in regional outfits and have various shades of skin tone and appropriate ethnic facial features.

Barbie has faced a lot of adversity over the years. In addition to her breakup and reconciliation with Ken, she has been banned in Iran, has been challenged for market share by Bratz fashion dolls, and is frequently at the center of heated cultural debates. However, Barbie endures, and Mattel's latest earnings reports show that she is on an upswing. Barbie, like McDonald's, Disney, and Coca-Cola, is a global American marketing presence that will not soon fade away.

the image of the good life in 1950s America that Soviet premier Nikita Khrushchev threw a tantrum in 1959 when his visit to Disneyland was canceled due to security concerns.

If much of the world clamored to come to Disneyland, ultimately Disneyland went to the world, first with its new and expanded theme park in Florida, Walt Disney World, which opened in 1971 and included airplane links and internal hotels and restaurants. Tokyo Disneyland opened in 1983, and Euro-Disneyland opened outside of Paris in 1992. In the Tokyo park, Disney's stated strategy was not to adapt to the local cultures so that Japanese visitors could feel they had traveled abroad to a foreign venue.

From Disneyland's opening in 1955, critics have complained about Disney's tendency to sugar-coat history, to dilute the zest of earlier amusements, and to cynically manipulate crowds and promote consumption of useless goods. Re-

cent scholars such as Michael Sorkin and Alan Bryman have insisted that Disney's strategies should be recognized as pioneering formulas for many of the features of global consumerism. Bryman, a sociologist, has pointed to Disney's development of hybrid consumption methods that interlink sales and services and licensed images in multimedia as well as its use of grafted-on themes and landscapes carefully crafted to unleash consumer desire. Sorkin, an architect and critic, has discussed Disney's use of surveillance to control crowds and staff as well as Disneyland's erasure of apparent labor as two key ingredients of modern consumer venues. Disney workers are encouraged to think of themselves as performers. As such, they are trained to smile and to mean it. Such techniques for evoking consumer satisfaction are now widespread and have become defining features of global consumer venues.

■ Introduction: Music and Social Change

Popular culture experts dispute whether mass arts merely reflect or in some way guide the larger culture and even historical trends. There is no question that music has been an important conduit for culture in the era since 1945. Improved communication and entertainment media as well as the growth of diaspora communities encouraged the globalization of mass music genres and fusion of styles throughout this period. One also can see clear links between particular music and social movements. For example, gospel and the folk music revival of the 1950s and 1960s provided inspiration for the world-changing civil rights movement in the United States, while free jazz expressed the anger and search for liberation associated with the Black Power movement that followed. The music of the African diaspora has had an enormous worldwide influence in the period since 1945. Electric blues as well as rhythm and blues had a formative impact on the development of reggae music in Jamaica, which has since been exported as a world music, often associated with political messages, that has hybridized in new locales. The same roots can be pointed to for rock 'n' roll, which served as both a backdrop and a formative influence on the counterculture movements and mass student protests and strikes of the 1960s in the United States, Europe, Mexico, and Japan. The more recent genre of hip-hop, born in the urban ghettos of New York City, is rife with antiauthority messages that may be regarded as of political importance, or as with rock 'n' roll, it may be argued that the rebellious message is more a style co-opted by the larger consumer system in which it is distributed and enjoyed. The growing taste for world music, whether pure folk forms or modernized fusions

of the music of Latin America and the Caribbean, the Middle East, South Asia, and elsewhere, indicate a healthy circulation of music that transcends and challenges older geographic borders and national identities.

—Fred Nadis

Electronic Instruments and Recording Media

Electronic instruments and recording media surged in the mid-twentieth century with the end of World War II and the introduction of computers. Novel sound techniques and a healthy economy encouraged experimentation at universities across the United States and studios around the world, from Columbia and Princeton to Paris and Cologne. Meanwhile, reactionaries denied artistic merit to machine-based sounds. Scholars of classical and otherwise serious music echoed the aesthetic critique of standardized culture industries forwarded by Frankfurt School theorist Theodor Adorno. Yet progress was inevitable. A strong interest in innovation from committees of composers, programmers, producers, and engineers was strengthened by progressive politics in the 1960s and 1970s.

Years after the invention of the Theremin (the first electronic instrument, created in 1919), electronic organs and guitars were marketed and sold in the United States. A revolution in popular music forms ensued as the fixity of traditional acoustic instruments was bypassed. The turn of a knob or movement of a potentiometer could now alter pitch or timbre. Along with new forms of popular music such as urban blues and rock and roll came modern classical music and fresh approaches to composition. Pioneer electronic

► THE MOOG SYNTHESIZER

Robert A. Moog was a child prodigy. As a young inventor, he built a theremin at age 14 from magazine suggestions and published an article on his design five years later. Prior to completing a doctorate in engineering physics, he formed the R. A. Moog Company in 1964 and introduced small synthesizers to the marketplace. The Moog Synthesizer became the first commercial music synthesizer, with its efficient design and promise attracting composers and performers from diverse musical traditions. Developed in partnership with Herbert Deutsch and Walter Carlos in 1965, the synthesizer represented a turning point in electronic music history. The Moog's basic structure included attack-decay-sustain-release (ADSR) envelopes, which manipulated the onset, intensity, and fade of sound with four knobs. The synthesizer also included tone generators with keys to configure pitch. Committees used the synthesizer to reorchestrate works from J. S. Bach to Burt Bacharach. The instrument gained commercial success following its integration into Walter Carlos's album *Switched on Bach*. The small and inexpensive synthesizers opened the world of electronics to rock and jazz musicians and made tape-manipulation cutting and splicing less problematic. The goal was to generate complex sounds with the smallest number of mathematical calculations per sound sample. Moog, who died of brain

American inventor Robert Moog stands with his pioneering Moog synthesizer, 1970. (Jack Robinson/Hulton Archive/Getty Images)

cancer in 2005, earned numerous accolades in his lifetime.

—Christopher Joseph Westgate

music composers such as Karlheinz Stockhausen and Luigi Nono focused on the abstract instead of the concrete. But in 1948, composer Pierre Schaeffer introduced his *musique concrète* composition on a Cologne radio broadcast. Schaeffer was convinced that music of the future could be created by splicing recycled recordings of the past and unwittingly anticipated contemporary sampling practices. At the end of the 1940s, Louis and Bebe Barron experimented with the musical potentials of magnetic tape delay and splicing. The tape recorder began to revolutionize performance and reception.

Some of the earliest electronic music instruments were designed to subvert conventional scales and restricted ranges. Electronic compo-

sition thereby challenged normative perceptions of tonality and temporality. Modern echo chambers and new percussive sounds slowly began to emerge. Composer John Cage collapsed the sound of silence in 1952 with his *4'33"* by instructing a performer to sit at a piano for four and a half minutes of ambient noise. In 1956, the Radio Corporation of America (RCA) designed a self-contained sound synthesizer with which the performer manipulated pitch and volume. The RCA synthesizer was subsequently used in a grant to form the Columbia-Princeton Electronic Music Center. One year later, in 1957, Max Mathews edited notes with the click of a computer mouse at Bell Laboratories. The use of digital computers to control instruments was well under way.

Many composers preferred electronic instruments because they were adaptable and accessible. In 1963, Robert Moog along with composers Herbert Deutsch and Walter Carlos designed small synthesizers. The resultant Moog Synthesizer was later integrated into popular music in Carlos's album *Switched on Bach*. A few years later, the Beatles experimented with tape collages and splicing. Other rock and pop musicians, drawn to exotic sounds that did not resemble those produced by other instruments, began to incorporate electronic keyboards and synthesizers into their music. The Voltage-Controlled Synthesizer was marketed in the middle of the decade and encouraged further experimentation as new technologies spread.

The Dutch company Philips developed the portable analog audio cassette in 1963 that made recording and duplication easier and cheaper. By the 1970s, many homes had a stereo system, phonograph, record player, tape recorder, and radio. Digital sampling whereby sounds were recorded, manipulated, and played back from keyboards or other musical devices was routine by the end of the decade. The search for fidelity, or the accurate reproduction of sounds, was the primary goal in the development of new media formats. The first compact disc (CD) was sold in 1982. The use of synthesizers and computer systems became far easier with the introduction of the Musical Instrument Digital Interface (MIDI) system, which communicated performance information to and from electronic instruments in 1983, enabling one instrument to sound like another. New recording technologies complemented new musical genres, from techno to hip-hop. Sony's production of the Walkman conflated public and private space. By the 1990s, it was possible to create CDs on personal computers. MPEG-I Audio Layer III (MP3) players were released in 1998. Eight years later, music archives (iTunes, Napster) were regularly offering new media content that users download or stream from the Internet. A digital division of labor will continue to reconfigure the present soundscape. The potential now exists to assemble and disseminate music with editing software in home or portable studios. Consumers may become tomorrow's producers.

Cold War Jazz

During the 1950s, faced with increasing criticism abroad of U.S. race relations and international policies, a loose alliance of politicians, music critics, diplomats, record executives, and musicians began to promote jazz as a uniquely American musical art form. In an oft-quoted phrase, jazz was seen by its supporters as "America's classical music" and was linked to American modernity, democracy, and individual freedom. Through jazz broadcasts on the Voice of America (VOA) radio and state-sponsored tours to the Soviet Union, Africa, the Middle East, and Asia, jazz musicians were cast as U.S. cultural ambassadors on the Cold War stage.

Jazz emerged sometime during the late nineteenth and early twentieth centuries and was pioneered by African American musicians in New Orleans, Chicago, and other urban settings who, using improvisation, call and response, and rhythmic syncopation, reinterpreted the blues, ragtime, spirituals, marches, and other popular music genres to create a style that would eventually come to be called jazz. The music reached its peak popularity during the 1930s and early 1940s when big band swing dominated American popular taste. As swing fell out of fashion in the mid-1940s, a new style that critics dubbed bebop emerged, characterized by virtuosic solo improvisations and increased harmonic and rhythmic complexity. Significantly, the musicians who pioneered this style eschewed labels, preferring to call what they created modern music. These performers saw themselves as artists rather than

Louis Armstrong, frequently featured on the U.S. State Department's Jazz Ambassador tours of the Cold War era, traveled to the Congo in 1960 and in 1961 to Egypt where he and his wife posed near the Sphinx and a pyramid at Giza. (Bettmann/Corbis)

merely entertainers and, especially in the case of African American musicians, saw bebop's association with modernity (embodied in its emphasis on virtuosity and individual improvisational freedom) as a counterbalance to Jim Crow practices within a music industry that had a long history of white appropriation and commodification of African American musical forms.

The alliance of jazz and politics in the 1950s was due in part to the growing popularity of jazz programming on VOA radio, particularly shows such as Leonard Feather's *Jazz Club USA* and Willis Conover's *Music USA*. Both shows steered clear of propaganda in favor of musical programming and found receptive audiences in many parts of the world. In addition, Feather and Conover promoted jazz's modernity and universalism as an antidote to the Soviet Union's perceived cultural dominance in classical music and ballet. At the urging of sympathetic congressmen and music critics, the U.S. State Department began organizing tours featuring jazz artists such as Dizzy Gillespie, Duke Ellington, Louis Armstrong, Benny Goodman, and Dave Brubeck, sending them to the Soviet Union, Eastern Europe, and newly emerging states in Africa

and Asia, areas considered to be especially vulnerable to the Soviet communist threat.

The organizers promoted a vision of jazz's universalism and racial equality, an ideology underscored by the number of African American musicians on the tours. While jazz musicians were often seen as somewhat apolitical, the irony of African Americans representing an image of American racial harmony abroad at a time when Jim Crow laws were still in place throughout much of the United States was not lost on many of the tour participants. The Montgomery bus boycotts had begun during the same month that plans for the first State Department tours were being finalized in 1955, and most of the musicians, both black and white, were sympathetic to the civil rights cause. Louis Armstrong, who had always projected an engaging (and thus nonthreatening) public persona, created a stir when he refused to take part in a 1957 Soviet tour in protest of President Dwight D. Eisenhower's slow response to Arkansas governor Orval Faubus's efforts to block school integration in Little Rock. Moreover, the tours themselves were attacked by conservative congressmen and citizens' groups and met occasional opposition from local diplomats. But by and large the concerts were enormously successful both in presenting an alternative portrait of U.S. race relations and drawing enthusiastic crowds in places as diverse as Syria, Yugoslavia, Pakistan, and Ghana. These events also generated largely favorable press reviews back in the United States.

A History of Rock and Roll, 1945–Present

Rock and roll music, with its close connection to the blues, expresses anger, joy, and pain. Its roots can be found in Negro spirituals, field hollers, and the caricatures of African American music that originated in minstrel shows in the mid-1800s. Twentieth-century blues artists such as Robert Johnson and B. B. King, using some of the call-and-response rituals of cotton-field-expression and religious worship, gave birth to the new forms of electric blues, rockabilly, and rhythm and blues. In its popular form, this music emphasized particular rhythms suitable for dancing that later became known as rock music.

The mainstream appeal of rhythm and blues and rock began to grow by the mid-1950s with African American and white performers such as Chuck Berry, Bill Haley and the Comets, Jerry Lee Lewis, Little Richard, and Johnny Cash. This new music, often mixed with country music and gospel, and the outrageous behavior of these outsized performers often challenged mainstream notions of race, gender, class, and sexuality.

During the early 1960s, the soul music of James Brown, the Supremes, the Temptations, and Aretha Franklin carved out a new place for African American involvement in American popular music. When such mainstream so-called race music disturbed conservative listeners, the record industry also created sanitized versions of earlier rhythm and blues songs with white crooners Frankie Avalon and Pat Boone. In this same era, which saw the rise of the civil rights movement, Bob Dylan, the Mamas and the Papas, and Peter, Paul and Mary crafted folk tales and songs of social protest, furthering a tradition nurtured by composers and singers such as Woody Guthrie, Pete Seeger, and Leadbelly during the 1930s labor struggles.

The Ed Sullivan Show produced two major historic moments in rock and roll: the debuts of Elvis Presley in 1956 and the Beatles in 1964. Both served as cultural milestones, giving American youths new icons as rock was introduced into the American home. Teenagers sought heroes. Television helped rock and roll become part of the new youth culture that advertisers

targeted with magazines, advertisements, movies, and record sales.

In the 1960s, public outrage over the war in Vietnam, violent reactions to civil rights demands, and other social issues helped formulate a countercultural ethos. The counterculture often turned to drug experimentation, particularly to Lysergic Acid Diethylamide (LSD), as part of their rejection of mainstream values. This subculture and the altered consciousness of drug users gave rise to the psychedelic rock of the Beatles, the Jefferson Airplane, Janis Joplin, the Grateful Dead, Jimi Hendrix, and the Doors. Acid rock dealt with politics, philosophy, drugs, and sexual experimentation. Even more than overt political change, the counterculture valued ecstatic esoteric experiences, sensuality, moments of cultural deconstruction, and transcendence, all thought to be achieved through LSD.

British invasion rock had peaked between 1964 and 1965 with the prominence of groups such as the Beatles, the Rolling Stones, the Animals, Herman's Hermits, the Birds, the Yardbirds, the Kinks, and the Who. England also produced a different sort of youthful unrest: songs emphasizing myth, legend, fantasy, mystery, and anger. The music of Black Sabbath and Deep Purple reflected a darker rebellion and melancholy, a reminder of the depths of human suffering and the longing for esoteric release. Strongly working class and fascinated with the unseen, or the occult, these groups became the archetype for the classic rock and heavy metal music of the 1970s and 1980s.

While the Woodstock music festival of 1969 helped define the counterculture, post-Woodstock rock and roll had many facets. The soft-edged music of bands such as the Eagles connected with those living the daily grind. Singer-songwriters Elton John and James Taylor offered stories. The band Kiss and the artist Alice Cooper filled arenas with vaudevillian antics. While Cream, Led Zeppelin, Lynyrd Skynyrd, and Aerosmith continued in the tradition of heavy metal and psychedelic music, other genres developed. Disco music, with its flashing lights and simple but infectious beat, was embraced as a simple pleasure, a relief from the dreariness of the protest years. While groups such as the Bee Gees created a

BRITISH INVASION

The Beatles debut on The Ed Sullivan Show in New York City on February 9, 1964. (Hulton Archive/Getty Images)

The Beatles, formed in Liverpool, England, in 1960, released their first single, “Love Me Do,” in Britain in 1962, and after rising to fame in Europe they arrived in the United States, the center of the music industry, in February 1964. Their catchy songs, long hair, and cheeky humor displayed in interviews made them a sensation. The four members of the Beatles—John Lennon, Paul McCartney, George Harrison, and Ringo Starr—played American rock and roll, soul, and rhythm and blues music and combined these styles with British folk and music hall traditions.

Approximately 73 million people, the largest television audience at the time, watched the Beatles’ first television appearance on *The Ed Sullivan Show* on Sunday, February 9, 1964. The Beatles single “I Want to Hold Your Hand” reached number one in the United States on February 1, 1964, and in April the Beatles held the top five positions on the Billboard chart. The success in the United States was replicated around the world as the Beatles incorporated a variety of styles into a series of innovative albums that profoundly influenced youth culture even after they disbanded in 1970. The arrival of the Beatles heralded a British invasion of the United States and a period of unparalleled British dominance of popular music. Prior to 1964, only two British singles had ever topped Billboard’s chart. In 1964–1965 British acts were number one for 56 weeks.

—John F. Lyons

market for dance clubs, others drew inspiration from classical music and jazz. Progressive rock became the tag for Kansas, Queen, Yes, Rush, and the classically influenced Emerson, Lake and Palmer.

Punk rock, with its nihilism, anarchy, and do-it-yourself garage band approach, formed in New York and Great Britain during the late 1970s, most notably with groups such as the Sex Pistols and later the Clash. The New York Dolls and David Bowie created the glam (glamorous) rock band culture, which reached its peak during the 1980s. Glam rock was defined by stage theatrics and androgyny, its performers wearing exaggerated hairdos, cosmetics, and flamboyant clothing.

Christian rock, now an influential genre, first formed in the early 1970s with the posthippie religious revival known as the Jesus People Movement. Larry Norman, Love Song, and the Resurrection Band are viewed as the earliest Jesus music artists. This genre evolved into contemporary Christian music and Christian rock. Modern groups include Jars of Clay, DC Talk, and P.O.D.

With MTV and other forms of mass media, the impact of rock and roll grew during the 1980s. Arena rock bands Def Leppard and Van Halen thrived with larger-than-life shows. U2 and humanitarian lead singer Bono came to fame, while New Wave groups such as the Talking Heads, Devo, and David Bowie emphasized technological savvy, futuristic vibe, ironic or alienated lyrics and posturing, and protoalternative music. New Wave became the commercial version of punk.

Inner-city problems played a tremendous role in the rise of rap music. While the Sugar Hill Gang, Grand Master Flash, and Public Enemy were among significant progenitors during the late 1970s and 1980s, Michael Jackson created a space for African Americans on MTV, changing the dynamics of race within the music industry. Jackson helped break the racial barrier. Madonna’s iconic status created a greater space for women.

Groups of the 1990s challenged gender assumptions as female singer-songwriters filled the airwaves. Alanis Morissette, Tori Amos, and Traci

Chapman were among an amalgam of female alternative rock and folk rock stars, while Seattle, Washington, became the epicenter of the grunge sound. Nirvana, Soundgarden, and the Stone Temple Pilots created a new language of anger, with a partial return to punk. As grunge found success, metal continued as the subgenres of thrash, death metal, hard core, black metal, and Goth emerged. While metal has always been subcultural, one of its greatest commercial successes has been Metallica.

As the twentieth century came to a close, female pop stars found greater success. The media saturated hundreds of cable channels and Internet sites with boy bands and girl bands. Pop stars Britney Spears and Jessica Simpson continue to thrive as mass media reinforces image. Although their genesis predates the millennium, groups emphasizing emotion, simply called Emo bands, such as Jimmy Eat World and Dashboard Confessional, spawned yet another chapter in rock's history. Many modern groups retain a sense of social responsibility and have helped support numerous political causes, such as U2 lead singer Bono's work to alleviate global poverty and AIDS with the ONE Campaign. Yet the rebellious style associated with rock and roll has also become part of mainstream consumer culture.

Latin American–Caribbean Music and Dance, 1945–Present

The music and dance of Latin America and the Caribbean reflect cultural influences from the three continents brought together by the European conquest of the Americas: indigenous Amerindian, European, and African. The ruling classes in the Americas, almost exclusively of European ancestry, enforced a cultural hegemony that favored European aesthetics, genres, forms, and musical instruments. Yet the long-standing multiethnic nature of many nations resulted in the increased blending of European-derived music and dance with African and/or Amerindian influences during the twentieth century. Terms such as mulatto, mestizo, and creole (and their cognates), initially used to describe miscegenation, were transferred to the description of hybrid culture. Many music and dance genres celebrated in the twentieth century as symbols of national identity—the Argentinean tango, the Brazilian samba, and the Colombian cumbia—were initially reviled by the ruling classes because of their non-European content, lascivious rhythms, vulgar dances, and lower-class origins and were only later celebrated as genuine expressions of collective identity.

Numerous twentieth-century Latin American concert or classical music composers drew upon folk expressions for thematic material in their more neo-Romantic or nationalist works. Mexico's Carlos Chávez (1899–1978), Brazil's Heitor Villa-Lobos (1887–1959), and Argentina's Alberto Ginastera (1916–1983) are renowned for their nationalist compositions. Other composers applied classical compositional techniques to popular or folk traditions in which they were active performers. Such was the case of composer and *bandoneón* (button accordion) performer Ástor Piazzolla (1921–1992), who transformed the Argentinean tango into concert music.

In Mexico, many regional music and dance folk styles have been codified and disseminated through national folklore ensembles modeled after the Ballet Folklórico de México (BFM). Founded in 1952 by Amalia Hernández (1917–2000), the BFM provided a professional and artistic model for the presentation of regional folk

► BRAZIL

Brazil, the largest and most populous Latin American nation, has a distinctive culture resulting from its Portuguese rather than Spanish heritage and its Afro-Brazilian influences (Brazil participated heavily in the transatlantic slave trade and did not ban slavery until 1888). The African heritage is apparent in many Afro-Brazilian traditions, including the Candomblé religion as well as *capoeira*, a stylized Afro-Brazilian martial art performed to music. Rio de Janeiro's samba, a music and dance genre that grew out of Afro-Brazilian and Portuguese carnival traditions, achieved popularity from the 1920s. Since the 1960s Rio's Carnaval parade has evolved into a multimillion dollar televised spectacle. In the late 1950s, a new popular music style called bossa nova combined a relaxed samba with jazz and classical music harmonies. Embodied by the compositions of Antonio Carlos Jobim (1927–1995) and performances of João Gilberto (b. 1931), bossa nova achieved lasting worldwide popularity. In the 1960s, Brazilian popular music, known by the acronym MPB (*música popular brasileira*), diversified in reaction to both global social revolutions and Brazil's 1964 military coup. MPB singer-songwriters such as Chico Buarque (b. 1944) created samba-based popular music as vehicles for poetic social commentary, while Gilberto Gil (b. 1942) and Caetano Veloso (b. 1942) produced recordings more eclectic and experimental, creating a short-lived but influential musical movement called *tropicália*. In Brazil's north-

Two practitioners of capoeira, an Afro-Brazilian martial art performed to music. (Ricardo Koji Kaihami)

east, several new or updated Carnaval traditions emerged from the city of Salvador, including *afoxé* (percussion-heavy secular processions sponsored by Candomblé houses) in the late 1940s, *trios elétricos* (heavily amplified truck-mounted bands playing fast marchlike *frevo* music) in the 1950s, and *blocos afro* (bass drum-heavy Afro-Brazilian Carnaval parade groups) in the mid-1970s. Euro-American rock music remained an influence from the early 1960s on, while American soul and funk and rap music prompted Brazilian counterparts in the 1970s and 1990s, respectively, primarily in the cities of São Paulo and Rio.

—Kevin Delgado

cultures by subsequent companies formed in Latin America. While many indigenous folk music traditions persist in rural and agricultural areas, regional and commercial styles dominate public consumption of music. The *canCIÓN ranchera* (country song) was widely popularized through radio and film beginning in the 1930s, while the mariachi music of Jalisco became popular in the capital and was transformed from a regional to a national music. In the 1950s, the accordion-based *norteño* (northern) music became more popular as it expanded its ensemble with the addition of the bass guitar, *bajo sexto* (a type of 12-string guitar), and drum set as well as vocals. In the early 1990s, traditional and updated *banda sinaloense* (brass band mu-

sic from the Sinaloa state) enjoyed a surge in national popularity. Both *norteño* and *banda* music in turn energized the traditional *corrido*, a narrative ballad genre that since the early nineteenth century has described historical, topical, and allegorical events. In the late twentieth century, *corrido* subject matter included the homesickness of Mexican migrants in the United States and the September 11, 2001, terrorist attacks, while the popular subgenre of *narcocorrido* (drug corrido) chronicled the violent world of drug trafficking.

In the Caribbean, performative culture primarily blends European and African heritages, the indigenous population having either perished as a result of colonization or largely absorbed

through intermarriage into colonial populations. Cuba is prominent in Afro-Hispanic music and dance, with genres such as the *son* and *danzón* enjoying widespread popularity in the early twentieth century. The *son*, originally a vocal genre utilizing guitar-type instruments and Cuban hand percussion (later adding the bongo drum, bass, and a trumpet or cornet), consisted of rhyming verses followed by a *montuno*: a section of music featuring African-inspired call-and-response song form, animated rhythms, and improvisation. The *son* begat the *son conjunto* in the 1940s, an ensemble that added multiple trumpets, piano, and *tumbadora* (conga drum) to the traditional *son* ensemble, creating a musical framework for subsequent salsa music. The *danzón* produced two extremely popular music and dance genres in the 1950s: a big band version of the mambo, and the cha-cha-cha. In the 1970s, state-supported ensembles such as Irakere drew heavily from Afro-Cuban sacred music, jazz, classical, and Cuban dance music, while in the late 1980s a virtuosic dance music called *timba* emerged in Havana. Among the Francophone islands, Haiti transformed the popular Dominican merengue (which itself was influenced by the earlier Haitian *mereng*) into the Haitian *konpa dirèk* in the 1950s and, in response to British pop music, *mini-djaz* in the 1960s. In the 1980s, *mizik rasin* (roots music) fused Afro-Haitian percussion with social protest against Haiti's political turmoils. Also in the 1980s, musicians from Martinique and Guadeloupe created an energetic hybrid music called *zouk* (party), sung in Creole rather than French, that swept the Francophone Lesser Antilles. The Anglophone nations of Jamaica and Trinidad and Tobago have been extremely influential musically.

In South America, many indigenous music and dance traditions are preserved in the Amazonian forests and Andean mountain and *alti-plano* (high plains) regions. In Peru and Bolivia, genres such as the *huayno* and *yaraví* appear to be mestizo creations based on indigenous antecedents. Both indigenous and mestizo cultures have appropriated European instruments, including brass and woodwind ensembles, and a variety of chordophones (stringed instruments that were virtually unknown in the Americas before European contact). Beginning in the 1950s,

popular groups such as Los Jiraras from Bolivia began combining into a hybrid ensemble instruments and repertoires that had previously been distinct, regional, or seasonal. This instrumentation, commonly including *charango* (a small guitar-type instrument), *quena* (end-blown flute), panpipes, *bombo* (bass drum), and guitar, has since become a popular Andean concert tradition.

Political protest is associated with the South American *nueva canción* (new song), a neo-folk political song movement that began in Chile in the 1960s and gained popularity throughout Andean South America. Initiated by an urban folklore revival, *nueva canción* relied on the symbolism of indigenous Andean imagery, genres, and musical instruments to bolster its connection with the lower classes. Prominent groups such as Inti Illimani and Quilapayún took indigenous-language names as well. Following a 1973 military coup, *nueva canción* was banned and its musicians forced to disband or sent into exile, while leading singer-songwriter Víctor Jara (1932–1973) was killed in government custody.

Many important popular music genres of the post-1945 era such as the Colombian cumbia, salsa (a New York marketing term for Cuban dance music performed by musicians of many nationalities), *nueva canción*, and Jamaican ska and reggae as well as romantic popular ballads styles have enjoyed transnational success. From the 1960s on, rock music from the United States and England has inspired a variety of local equivalents, as have rap and hip-hop. The popularity of *reggaetón* at the beginning of the twenty-first century—a Spanish-language dance music style founded upon Jamaican dancehall (the digital beat and deejay-dominated descendent of reggae), created in Panama, popularized in Puerto Rico, and disseminated north and south via electronic media—illustrates the increasingly international nature of commercial music and dance genres in Latin America and the Caribbean.

Sub-Saharan Music, Post-1945

Every aspect of African social and cultural life—whether the birth and naming of a child, initiation into adulthood, storytelling, worship, marriage, death, play, work, or control of social behavior—is associated with music. Every form of activity has its own special music, and every culture has its musical style, often linked to an ethnic group's spoken language. The African continent is home to a wide range of musical genres, and thus care is needed in using general terms to define African music. African music, produced by local and foreign-based distributors, is commonly a community affair and thus enjoyed by all: village folks, urban poor, well-to-do and educated elites as well as young and old.

Fela Anikulapo Kuti was a Nigerian musician and pioneer of Afro-Anikulapo beat music, shown at a concert in about 1980. (David Corio/Michael Ochs Archives/Getty Images)

Live music and radio, which first appeared on the continent in the 1920s, became and continues to be the primary means of listening to music. Indeed, with the advent of radio, early record companies such as the African-based Gallo-Africa as well as French and British-owned labels such as Pathé, Zonophone, and Decca recorded, produced, and disseminated African music to a broader audience on the African continent.

For Africans who live south of the Sahara, music comes in both traditional and modern versions, but both are profoundly rooted in native traditions and in an approach to singing or playing musical instruments that are percussive in nature. The decolonization that took place in the 1960s along with the rapid urbanization and general modernization of African societies have produced a fusion of the traditional and the modern that draws heavily as well from African American music. This hybridization has created various regional sounds known all over the world, including highlife, juju, Afrobeat, soukous, and benga. The world first gained a taste of African popular music with Miriam Makeba's *Kilimanjaro* and Hugh Masekela's *Grazing in the Grass*, which topped the American charts in 1968. But it was the Ghanaian band Osibisa that became the big breakthrough performers during the 1970s with their Afro Rock fusion music that sold millions all over the world. Since then, with radio programs such as those available on the BBC World Service and lately on the Internet, African music, classified now as World Music, has become a global affair.

Without a doubt, the rise of modern African music styles that rely heavily on electric guitars has provided great opportunity to introduce African musicians to the world. From West Africa comes highlife, a popular urban style of music centered on guitar that developed in the early twentieth century in Ghana and then spread to other West African countries. African musicologists believe that highlife music is a unique African sound of music style that blends indigenous dance rhythms with American blues, Caribbean reggae, and Western rock and pop music. West Africa is also the home of juju music, described as the Nigerian cousin of highlife that relies on a synthesis of traditional Yoruba rhythms with

➤ REGGAE—POLITICAL PROTEST OR RELIGIOUS EXPRESSION?

In mid-twentieth-century Jamaica, street-corner loudspeaker sound systems were common in Kingston, playing recent song releases whether jazz, New Orleans blues, or even country and western music from the mainland. Soon these spots started playing the records of local artists, with their rhythmic, African influences, resulting in a homegrown record industry. Coinciding with Jamaican independence in 1962, ska, with its electrified instruments and rhythmic emphasis on the upbeat, became popular, creating a new local sound based on a variety of traditions, including Trinidad's calypso music, best exemplified in the postwar period by the playful singing and sly lyrics of "The Mighty Sparrow." Ska was followed by rocksteady, which was less wild melodically and included lyrics, as in calypso, that often focused on social and political commentary. Reggae reasserted the overarching rhythm in the late 1960s but kept room for individual expression and its own lyrical realism.

It was Bob Marley and his group The Wailers who launched reggae onto the international stage. However, reggae and its predecessors were already popular in Great Britain, where it had been imported by West Indian immigrants. The alternative nature of ska and reggae also resonated with certain white youths, so-called mods in the early 1960s, who used it to distinguish themselves amid the general cultural identity crises of the period. Through Marley, reggae became associated with Rastafarianism, a religion inspired by the Old Testament and that holds the late Ethiopian emperor Haile Selassie, aka Ras Tafari, as divine. Besides the characteristic dreadlocks and cannabis smoking as sacrament, Rastafarians believe that all black peoples will eventually return to Africa, their rightful paradise. Although it became a vehicle for religious and political expression in albums such as Marley's *Natty Dread* (1975), reggae and its relatives, including contemporary dancehall in Jamaica and Spanish-language *reggaetón*, are more than that. Through all these variants of reggae, artists illustrate the woes, distinctiveness, and cultural wealth of the African diaspora.

Bob Marley, a reggae pioneer, helped bring this Afro-Caribbean music to the world stage. Reggae has developed into a popular style throughout the world, including Africa. (Jeff Albertson/Corbis)

native blues. King Sunny Ade is perhaps the most well known of all current juju performers.

Another ever-popular genre, Afrobeat, was pioneered by Nigeria's Fela Anikulap (Ransome) Kuti in the early 1970s. Kuti described Afrobeat as a fusion of highlife, American black soul, jazz, and traditional Nigerian musical styles. The *makossa* style of African music was played by Cameroonian saxophonist Manu Dibango of "Soul Makossa" fame. A distinct modern style of the traditional *mbalax* has emerged in more recent times in the SeneGambia and Mali regions. Normally played by traditional talking drums, its most influential artists are Youssou N'Dour of Senegal and Salif Keita of Mali. Although African music is associated with drumming, Africans employ a wealth and variety of modern and traditional musical instruments to make and enjoy music: xylophones, the *kora* (a stringed instrument), flutes, trumpets, harps, horns, and bells as well as staples of Western jazz and rock bands. Performers also use their arms, waists, and feet and adorn their bodies with noise-making instruments such as ankle rattles so that when they dance, the music produced by the movements is a musical event by itself.

Since the 1960s another popular African sound that swept the continent, especially in Francophone Africa, was the Congo dance-band music style called soukous. Often sung in Lingala, the common language of the Democratic Republic of Congo in central Africa, soukous also blends traditional Congolese music with Latin American rhythms such as the rumba and the cha cha cha, Caribbean beats, and American jazz. The music is so infectious that it has proven popular throughout Africa and beyond, especially in France where a large Francophone African expatriate population reside, and among a wider European audience.

Eastern and southern African societies have also produced their own sounds. A widely popular style is the *benga*, originating from the Luo people of Kenya. Apart from that, Thomas

Mapfumo has popularized a style of music from the Shona people of Zimbabwe known as *chimurenga*, often based on traditional music in Zimbabwe and Shona harmonic patterns. South Africa is also home to several styles. Besides the *kwela*, there is the *iscathamiya*, a traditional Zulu call-and-response cappella choral music popularized by the group Ladysmith Black Mambazo, which achieved international recognition with its collaboration with American pop star Paul Simon and their Grammy Award-winning album *Graceland* (1986). The *mbaqanga*, also sometimes called Township Jive, is another South African township music that draws its influence from swing-era jazz and was first popularized in the 1960s and introduced to the pop world by artists such as Johnny Clegg and Mahlatini and the Mahotella Queens.

Africa's music is never static and continues to evolve largely as a result of the continent's integration into the world's communication networks. For example, even though reggae is Jamaica's popular music and hip hop and rap are contemporary African America's popular music, these musical styles have now been added to the repertoire of Africa's music sounds. Reggae and hip hop are everywhere in Africa, but Africans have added their own flavors and distinctive styles to these musical genres and continue to produce a great diversity of African sounds.

■ Introduction: The Growth of Sports around the World, 1945–Present

Since the end of World War II, sports around the globe have grown significantly as a result of various factors: the politicization of sport, the media revolution, the introduction of a big business mentality to sports associated with television and sponsorship, and the subsequent globalization of sports as a result of television, cable television, and the Internet. The growth of sports at the global level has served to increase spectatorship and participation in athletics and has served to create a common bond that can transcend geographic location.

The politicization of sports dates to the late nineteenth century, when physical education became a requirement within public schools across Europe and the United States. The primary aim of physical education was to create healthy boys, to fill the nation's military once they were grown, or for girls, to produce strong children once married. Other contemporaries, such as Pierre de Coubertin, the founder of the modern Olympic Games, viewed sports, especially team sports, as ideal ways of instilling characteristics such as teamwork, fair play, and advancement based upon merit, fostering democracy on the playing field. Thus, by the turn of the twentieth century, sports began to play a more important role within the schools and within the social realm of adults.

During the interwar period (1919–1939), the politicization of sport by regimes such as Germany and Italy took new forms, through heavy state investment and promotion of athletics in order to win national accolades and thus international glory through sporting success. One such example was the Italian soccer team that, under Fascist sponsorship in the 1930s, won numerous global titles, including the 1934 and 1938 World Cups and the 1936 Olympic gold medal.

However, with the end of World War II, governments began to encourage even more actively sport development and growth. During the Cold War, athletic contests allowed a nation's elite athletes to defend national honor on center stage. To this end, international competitions, such as the Olympics and the World Cup, became

more important, and many governments openly financed athletic training so that their athletes could excel in competition. The most famous sports clashes of the Cold War include the Hungarian versus Soviet water polo match at the 1956 Sydney Olympics, which occurred shortly after the brutal Soviet crackdown in Hungary. Others include the Soviet versus U.S. Olympic ice hockey final of 1980, which pitted the two rivals against each other on the hockey rink, and the England versus Argentina quarter-final match in the 1986 World Cup, which took place shortly after the Falklands War of 1982. Since the fall of the Berlin Wall in 1989, nationalistic competition via sport is still a priority for many nations, especially those in the developing world, as winning international athletic accolades can boost a nation's international standing and prestige.

The role of the media and its evolution in the postwar period also greatly shaped the growth of sports around the world since 1945. Television was the first major catalyst for change, as it completely altered how sports were consumed. No longer was it obligatory to attend an athletic event in person or read an account of it in the newspaper to follow one's team. Television enabled the spectator to watch sports events in real time from the comfort of the home. The first-ever televised sports events occurred in 1931 when Japan's Waseda University broadcast a baseball game and Great Britain's John Logie Baird, an inventor, broadcast the Epsom Derby. Within the United States, the first sports event televised was a 1939 baseball game between Columbia and Princeton universities. The first televised World Series baseball games appeared on network television in the United States in 1948, with other sports shortly following suit.

Television viewership from the 1950s onward was increasingly sports-centric and served to significantly bolster the spectatorship of many sports events, including soccer, baseball, ice hockey, American football, and the Olympics. Although it was initially feared that increased television sports viewing would lead to a decline of in-stadium spectator attendance, the broadcast

of sports events did just the opposite: it created a larger market of sports spectators.

From the 1960s onward, television became central to sports. As sports viewership increased, advertising on television during sports broadcasts became more coveted and more expensive. Conversely, as the broadcasting rights to sports events became more expensive, it was no longer financially feasible for a sports event to have only one sponsor, and thus began the multisponsored sports events of the late twentieth and early twenty-first centuries.

The advent of cable television brought significant challenges to network or state-run television in maintaining viewership in the 1980s, and this was only the first of a new onslaught of threats to chisel away at network television sports. With the advent of the Internet in the late 1980s and early 1990s, sports as well as gambling on sports began to be disseminated through a new medium. The Internet facilitated sports viewership and, some argue, sports participation.

Not only did government sponsorship or encouragement of athletic participation help to spread the popularity of sports across the globe in the postwar period, so too did the media revolution by making sport spectatorship more accessible to the masses, regardless of geographic location. Today, the most popular sport in the world is soccer. During the 2002 FIFA World Cup, televised coverage of the matches reached 213 different countries, for a total of 28.8 billion viewers worldwide over a period of 25 days. Due to the growth of sport and the advances in technology made by television and the Internet, today fans can follow their teams whether they are located down the road or an ocean away.

—*Lindsay Sarah Krasnoff*

Sports and Politics, 1945–Present

While the games of antiquity were already political objects for the victors and the organizing city, modern sport has maintained close links with the delegation of power since it came into being in Great Britain in the nineteenth century. With its characteristically competitive and spectacular aspect, sport gives material and visible form to the expression and outcome of a combat. As a symbolic vector for political confrontation, it is

all the more attractive as it is popular and ever present in the media. Despite the ideological discourse of sports institutions such as the International Olympic Committee (IOC) and national and international federations, which proclaim that it is apolitical, sport has never been neutral. The close ties between sport and politics can be observed at every period in its history and at different levels: nationally, sometimes even locally, and internationally.

Through induced identification mechanisms, sports competitions and spectacles tend to bind the popular masses to the nation. By promoting and controlling sport, totalitarian states conveyed the image of a strong nation and assured their popularity thanks to sporting propaganda. The Italian victory at the 1934 soccer World Cup became Benito Mussolini's and the regime he led. The Berlin Olympics, lavishly organized by Germany in 1936, demonstrated Adolf Hitler's power on the international scene. Communist regimes (from Stalin to Mao Zedong) have made systematic use of sport to grandstand and showcase their regimes. The victory of the West German soccer team in the 1954 World Cup was experienced by the Germans as a time of resurgence, summed up in the words "wir sind wieder Wer!" (We are somebody again!).

In the colonial context, sport appears as a vector for national demands. At the start of the 1960s under French colonization, the Algerian National Liberation Front (FLN) created the soccer team of the Algerian nation that went on tour in the Eastern Bloc countries and the Arab world. The affiliation of the Palestine federation to the International Federation of Football Association (FIFA) in 1998 was based on similar intentions.

Faced with intercommunity or multiethnic difficulties, nations turn to the unifying virtues of sporting victory. France, in the person of the president of the Republic, rejoiced in the 1998 soccer World Cup victory by a "Bleu, Blanc, Beur" (Blue, White, Immigrant) team, which supposedly personified its multiethnic social reality and was proof of successful integration. Mauritius, drifting into communalism and ethnic tensions, organized the 2003 Indian Ocean Games as a means of rallying the different communities around a single flag and a rainbow nation.

At the local level, politicians use sports institutions for electoral purposes, either seeking to bolster their influence by obtaining a position within the sports organization or making political capital out of popularity acquired through sports. During electoral campaigns, candidates strive to secure the support of recognized sports figures to bolster their image or convey their political message. The presence of political personalities in the stadium during local, regional, or national competitions is considered evidence of their popularity and has become a ritual. In the United States, the values enshrined in sports—initiative, performance, strength, health, and so on—must be reflected in the president's image. From John Kennedy to George W. Bush, every American president has promoted an athletic image.

At the international level, sporting contests play a nonnegligible role in diplomatic relations between states. The competitions reproduce rivalries between nations in euphemized form. The earliest Olympic Games, such as the Paris Games in 1900 that were marked by anti-German chauvinism, expressed international tensions in Europe.

The decision to boycott—forbidding a team or state to participate in sporting competitions—is significant. Thus, the 1920 Antwerp Olympics confirmed the warlike qualities of the victorious Allies, all the more so because the defeated nations were not invited. Between 1920 and 1931, sporting competitions set France against only allied and neutral countries, ruling out any meeting with Germany. After 1945, with the entry of the Soviet Union and the socialist countries into international sporting bodies, it was within the context of the Cold War pitting East against West that the international sports events reflected rivalries. In 1980 at Moscow, 29 countries including the United States, Canada, West Germany, Japan, South Korea, and Norway decided not to participate in the Olympic Games as a protest against the Soviet invasion of Afghanistan. The response of the Soviet Union and the Eastern Bloc took the form of their 1984 boycott of the Los Angeles Olympics.

The globalization of sports federations such as FIFA or the IOC is today virtually complete, and everywhere their presidents are received like heads of state. Juan Antonio Samaranch was

➤ GERMAN NATIONALISM AND THE WORLD CUP 2006

Throughout the FIFA World Cup in Germany in 2006, multitudes of Germans took up their national symbol, their tricolored national flag of black, red, and gold, with sincere pride. Not since World War II had masses of Germans held their national symbols with such fervent pride on such a wide scale. Throngs of German youths painted their faces with their national colors when attending the various soccer matches. However, many international critics argued that this held a dangerous precedent in German history (particularly Prussian militarism and National Socialism) and were alarmed by the widespread display of German nationalism at many of the games and celebrations. This episode illustrates one way that sports and politics can intermix; in this case, the memory of the past and of the dangers of nationalism had influenced contemporary views of a sporting event.

—Abraham O. Mendoza

invited to deliver a speech to the United Nations General Assembly in 1992, although the IOC is merely a nongovernmental organization. Sport as a total social phenomenon is already omnipresent throughout the political sphere. By virtue of its diffusion, popularity, and mediatization, it has become a key element in politics.

Olympics and Politics since 1945

Since the revival of the Olympic Games in 1896, political issues have shaped the content and conduct of the games. During World War II the games were cancelled in 1940 and 1944. With the resumption of the Olympic Games in 1948, international political issues gained increased significance, with the Cold War tensions between the United States and the Soviet Union the dominant issue. Unprepared for competition in 1948, the Soviet Union first appeared in the Olympics in Helsinki in 1952. From that point, the Olympic Games were seen by many as a showdown between capitalism and communism, freedom and totalitarianism, good and evil. “They were in a sense the real enemy,” observed American decathlete Bob Mathias, who added

that beating the Soviet Union “wasn’t like beating some friendly nation like Australia.”

The conflict between the United States and the Soviet Union climaxed in 1980 when the United States led a boycott of 81 nations of the Summer Olympics in Moscow in protest of the 1979 Soviet invasion of Afghanistan. Despite the boycott, the United States defeated the Soviet Union in hockey at the Winter Olympics in Lake Placid that year. Dubbed the “Miracle on Ice,” the American victory was a great source of pride for a nation otherwise disappointed by the impending boycott. In turn, the Soviet Union led a boycott of the 1984 Olympic Games in Los Angeles. Cold War tensions dissipated after the collapse and breakup of the Soviet Union in 1989. Competing as the Unified Team in 1992, each of the former Soviet republics participated as individual teams in 1996.

Racial issues also have played a role in shaping the Olympic Games since the end of World War II. In 1964, the IOC banned the Republic of South Africa from participating in the Olympic Games for its refusal to reform its apartheid policies. Similarly, the IOC banned Rhodesia from the 1972 Summer Olympics in Munich for its racial segregation. In 1976, several African nations led by Tanzania boycotted the Summer Olympics in Montreal after the IOC’s refusal to condemn New Zealand for its rugby team’s tour of South Africa following the suppression of the children’s revolt in Soweto. Known as the All Blacks because of their black uniforms, the New Zealand team was also flouting international pressure to boycott the apartheid regime of South Africa. Previously banned Rhodesia returned to the Olympic fold in 1980 as Zimbabwe following a guerrilla uprising and the election of a majority black government in 1979. Zimbabwe won the gold medal in women’s field hockey with a team consisting mostly of whites. With the fall of apartheid in 1991, the Republic of South Africa returned to Olympic competition in 1992.

Racial tensions in the United States spilled over into the Olympic Games in 1968 when African American sprinters Tommy Smith and John Carlos, the gold and bronze medalists in the 200-meters, bowed their heads and raised black gloved fists during the playing of the national anthem at their medal ceremony. Other African

The Soviet Union's Unified Team celebrates victory at the Albertville Olympics in 1992. (AFP/Getty Images)

American track and field performers, such as Bob Beamon in the long jump, wore knee-length black socks as a symbol of racial unity. In contrast to the display of Smith and Carlos, African American heavyweight boxer George Foreman waved a tiny American flag in the ring following his gold medal bout.

In 1972, the Arab-Israeli conflict intruded upon the Olympic Games in Munich, West Germany. Early on the morning of September 4, eight members of the Palestinian terrorist organization Black September slipped inside the Olympic Village and raided the apartments housing the Israeli Olympic Team, killing two upon entry and taking nine Israeli athletes hostage. German snipers later opened fire on the terrorists at Fürstenfeldbruck, a military airfield, where they were to board a plane to Cairo. All but three of the Palestinians were killed, but not before they murdered the nine Israeli athletes. Postponed throughout much of the ordeal, the Olympic Games resumed on September 6, as Avery Brundage, the president of the IOC, declared that the “Games must go on.”

Domestic terrorism struck the 1996 Summer Olympics in Atlanta, Georgia, when a homemade bomb exploded in Centennial Park, killing one woman and injuring 111 other people. Richard Jewel, a security guard who discovered the bomb and attempted to lead an evacuation of the area became the principal suspect in the bombing. He was later cleared of all charges. In 2005, anti-abortion activist Eric Rudolph confessed to the bombing, stating that he wanted to bring an end to the Olympic Games because he believed they promoted global socialism and because he wanted to embarrass the United States for its sanction of abortion on demand. Rudolph also confessed to the bombings of abortion clinics in Atlanta and Birmingham, Alabama.

The IOC decision to award China the 2008 Olympic Games received much criticism from individuals, organizations, and governments concerned about China’s human rights record at home and abroad. Along the route of the Olympic Torch relay, dubbed the “Journey of Harmony,” protesters disrupted the ceremonies. The games themselves also were marked with controversies. One controversy involved the opening ceremonies in which a parade of children,

➤ THE TWO GERMANYS AND THE OLYMPICS

Germany’s division into two countries following World War II made it the embodiment of Cold War political divisions. Neither East Germany nor West Germany sent a team in 1952. After the Soviet Union recognized East Germany as a sovereign state in 1955, the International Olympic Committee provisionally acknowledged the nation but insisted that it must compete as part of a single German team. The combined team entered the Olympic Games from 1956 through 1964. Separate teams representing each of the two Germanys first competed in 1968. Fueled by a state-supported athletic training system that selected and trained potential champions from childhood, the East Germans quickly developed into an Olympic powerhouse that rivaled the Soviet Union. Since the fall of the Berlin Wall and the reunification of Germany in 1989, a single team once again has represented Germany in the Olympics.

Sports, Drugs, and Money

After winning the men’s 100-meter final in 9.79 seconds, a new world record at the 1988 Seoul Olympics, Canadian sprinter Ben Johnson was found guilty of doping. The news sparked a media storm. Yet it was no more than a case of modern methods illustrating a practice as old as humanity: the use of chemical substances to enhance performance. The evolution of the

Ben Johnson and Carl Lewis in the 100-meter dash at the 1988 Olympics in Seoul. Johnson's gold medal was later disqualified when a drug test revealed traces of anabolic steroids. (AP/Wide World Photos)

enhancement of sporting performances should be set against the scientific progress of pharmacology around three periods of significance: the 1930s, the 1960s to 1990s, and the present period, covering the last 15 years. As currently defined by the International Olympic Committee's (IOC) legal commission in 1997, "Doping is the presence in the athlete's body of a Prohibited Substance or the use of a Prohibited Method," making it a penalized and stigmatized practice. Yet for a century, sports authorities and states had remained discreet and showed little tendency to intervene in the face of very real doping practices.

With the simultaneous birth of industrialization and modern sport in mid-nineteenth-century Britain, the improvement of human performance by use of medicinal substances of vegetable or animal origin became a project that was both systematic and experimental. At the end of the nineteenth century, some athletes made use of substances such as heroin, already widespread in horse-racing circles, or morphine. In 1896, a 29-year-old cyclist, the Welshman Arthur Linton, died two months after taking part in the Bordeaux-Paris race as a result of using morphine. With the appearance of synthetic compounds, amphetamines were an immediate and lasting success with athletes. Amphetamines,

which act on the central nervous system, are reputed to inhibit fatigue, increase energy, reduce hunger, facilitate wakefulness, and enhance will-power. Available over the counter, these drugs are believed to have stimulated a number of athletes by 1936 at the Berlin Olympics. Similarly, the Japanese men's swimming teams, victorious in virtually all competitions in the 1932 Los Angeles Olympics, relied on the amphetamine trinitrine. The administration of doses was characterized by trial and error, to the detriment of athletes' health in many cases. Although discussed in a report published by the League of Nations in 1939, the risks of doping were neglected, as sports bodies remained incapable of detecting its traces.

The thirty years from 1960 to 1990 illustrate the simultaneous rise of sport as a spectacle and the appearance of hormone derivatives, notably corticosteroids and anabolic steroids. Sporting spectacles in this period involved considerable financial stakes through TV contracts and political stakes both nationally and internationally as a result of the East-West struggle. The sporting champion, a professional supervised by a medical team, was exposed to pressures that would sometimes lead him or her to use performance-enhancing drugs. Behind the scenes of the sporting event, the rivalry among doctors, researchers, and laboratories gained increasing prominence.

Apart from their androgenic effect, anabolic steroids (testosterone, methandrostenolone, nandrolone, trenbolone) develop muscle mass, increase stamina, and reduce the articular pains associated with overwork. These undetectable substances were widely used in sporting circles from the 1960s thanks to a highly lucrative underground market. It is known today that the government of the German Democratic Republic organized the doping of its elite athletes with the complicity of trainers and medical teams. The period saw the appearance of regulatory measures through the publication of lists of banned substances. The IOC published a list in 1967 and brought in the first doping controls in 1976. By the late 1960s, most of the major international federations had drawn up regulations aimed at preventing and combating doping. The French and Belgian governments committed

themselves durably to the struggle by passing anti-doping laws in 1965 that are regularly brought up-to-date.

At the end of the 1980s, growth hormones (GH), manufactured by genetic engineering and highly effective as a means of fighting the effects of aging, began to arrive on the illicit market. Erythropoietine (EPO) made its appearance during the Calgary Olympics. A certain number of athletes were suspected of using it. After Ben Johnson, the American Florence Griffith-Joyner, a 100-meter record holder and Olympic champion at 100- and 200-meters in 1988, aroused suspicion because of her spectacular physical transformation and the rapid improvement in her performances. Her sudden death in September 1998, at the age of 39, has raised questions. In 1996, the Atlanta Olympics were called the “Growth Hormone Games.” The Festina Affair, which rocked the 1998 Tour de France, brought into the open the methodical doping procedures of the racers, the distribution networks, and the sums at stake.

Faced with their responsibilities, sporting authorities and governments had to develop preventive and repressive measures on an international scale. On November 10, 1999, the Council of Europe created the World Anti-Doping Agency, a body independent of the sports movement. Commissioned to coordinate national policies and to harmonize actions between public authorities and sports bodies, its major task consisted of drawing up the world antidoping code that came into effect in Athens in 2004. Notions of authenticity in sporting accomplishments were at stake, as sports have continued to court a growing audience on television.

Global Soccer, 1945–Present

After World War II, as soccer increasingly became a source of national pride, the sport further disseminated across the world. While the monopoly of Europe and South America as the primary disputers of World Cup final games has not yet been broken, in this period Africa, Asia, Central America, and Caribbean countries developed from exotic guests to become indispensable actors in soccer's world theater. This expansion took part not only in national team competitions but also in the most important leagues of the world. At the same time, television broadcasting increased the influence of South American and European soccer culture and disseminated its more localized fan cultures to global audiences.

Continental organizations helped to expand soccer among their regions. South America created its own organization in 1916. The process was consolidated after World War II, when in 1954 both Europe and Asia created their own continental associations, followed by Africa in 1956 and Oceania in 1966. In 1961 a soccer federation was created to encompass countries from North America, Central America, and the Caribbean.

The progressive inclusion of new countries interested in participating in the World Cup indicates soccer's globalization. The first postwar World Cup, played in Brazil in 1950, included the exclusive participation of national teams from Europe and the Americas. In 1954 Asia was present in the World Cup for the first time. In 1966 the World Cup saw the first defeat of a European country at the hands of an Asian representative when North Korea defeated Italy 1–0. This victory also granted North Korea a place in the second round, another first for a team not from Europe or the Americas.

The World Cup of 1970, hosted by Mexico, included the participation of Morocco and Israel as well as El Salvador, the first Central American team ever to participate. Four years later in Germany, Haiti became the first Caribbean

► THE SOCCER WAR

The Soccer War was a conflict that engaged the armies of El Salvador and Honduras in July 1969. Although the conflict started barely a week after a game that decided which country would first attend the World Cup, the name is misleading. The conflict arose as a result of years of border disputes, internal economic tensions, and immigration disputes. The high density of population and lack of available land in El Salvador had promoted migration to neighboring Honduras, where conditions were the inverse. By 1969 as many as 300,000 Salvadorians lived in Honduras, where they represented 13 percent of the population. That year, the government of Honduras started to expel the immigrants, creating an economic crisis in El Salvador. This dispute led to a military conflict. The connection between the war and a soccer game is just coincidental, but the popular name indicates how important soccer has become as a source of national identity and pride.

—Marco Cabrera-Geserick

representative since 1930, Australia became the first country representing Oceania, and Zaire was the first sub-Saharan team to participate. In 1982 Cameroon finished that year's tournament undefeated, including a tie against Italy, that year's World Cup winner. In 1986 Morocco became the first African team to pass to the second round, and in 1990 Costa Rica did the same for the Central American region. The World Cup of 1994, played in the United States, signaled the first time that the World Cup was hosted by a country not considered a traditional soccer nation. Four years later, the World Cup continued its expansion to new areas when it was hosted in a joint effort by Japan and South Korea. The tournament is slated to have its first edition in Africa by 2010.

The introduction of television also influenced the process of globalization. The 1958 World Cup in Sweden was the first to be televised to an international audience. In 1970 Mexico was the first country to broadcast the World Cup in color. Currently, satellite signals broadcast the best games of European and Latin American leagues.

Revenues for broadcast rights and advertising have also led to large corporate presence in soccer club ownership. Such media saturation has helped export soccer fan culture, as local fan expressions have shifted to resemble the chants and supporting style common in Europe and South America. Fan loyalty is not restricted to the local team anymore and can include several international teams at the same time.

The strong image of soccer as a male domain has slowly changed. In some countries (and ethnic subcultures), as seen in the film *Bend It Like Beckham* (2002), women's participation was stigmatized. This perception included countries such as soccer-crazy Brazil, where until the 1970s laws forbade women's soccer. Thanks to the creation of a Fédération Internationale de Football Association (FIFA) Women's World Cup in 1991, followed by the inclusion of women's soccer in the 1996 Olympic Games, the sport became professionalized and has followed a globalizing trend similar to its male counterpart.

The growth of the game has made FIFA the largest international organization, representing more nations than the United Nations or the International Olympic Committee. In the 1990s the European Union ended its quotas limiting the number of foreign players in its leagues, allowing for the formation of globalized teams. Brazil became the main exporter of players, and Europe became the main market. Japanese players can be found playing in Argentina, Cameroonian players can be found playing in Mexico, and Central American players can be found playing in China.

Globalization of Basketball

The game of basketball gained global popularity over the last century but has exploded internationally in the last three decades. At one point basketball was considered as American as apple pie along with that other great national pastime in the United States, baseball (which has also undergone a parallel process of globalization in the last half century). This global spread of basketball is partially responsible for and has also been shaped by the modern phase of global media and communications technology, advertising, the global sports industry, and even international politics. The global spread of basketball was and continues to be—like so many facets of contemporary culture—tied into patterns of consumerism and national identities.

Dr. James Naismith, a Canadian, invented the game of basketball in 1891 while working as a YMCA athletic director in Springfield, Massachusetts. The game, designed to be an indoor activity for youths that required skill and not simply strength, was first played with a soccer ball, a borrowing from yet another global sport. The game changed as it spread in the United States but also was actively being spread to other nations through the YMCA movement as early as 1893. Founded in Switzerland in 1932, the International Basketball Federation (FIBA) controls and determines the rules and regulations for basketball internationally. Basketball was first featured at the 1936 Olympics in Berlin, and the Olympics also has played a large role in shaping how basketball has been played internationally. Globalization increased from the late 1970s through the 1990s, as the privatized use of satellite communications and cable television made basketball broadcasts available to a widening international market; along with broadcasts came other media coverage, marketing, and a flow of transnational

➤ HARLEM GLOBETROTTERS

Although the exact details of their origin is disputed, the Harlem Globetrotters—also known as the “Ambassadors of Goodwill,” the “Magicians of Basketball,” and many other monikers—were formed in the mid-1920s in Chicago’s Southside and have been performing their sport around the globe since. Throughout its tenure the team has played more than 25,000 games, become involved with worldwide charities and organizations, met with major world leaders such as Pope John Paul II (who joined the eclectic ranks of other famous Honorary Harlem Globetrotters such as Whoopi Goldberg and Henry Kissinger), and continually worked to spread the game of basketball across the planet. The Harlem Globetrotters represent, among other things, a unique caricature of the American style of play—with an emphasis on individual ability. They also reflect a greater tension present in the spread of basketball, between an American national identity and a global identity. The Harlem Globetrotters are named for Harlem in New York and are outfitted in red, white, and blue, the colors of the United States. These and other aspects of the Harlem Globetrotters act as cues to signify that they represent a particularly American identity even as they work to spread basketball globally.

—Anthony Kolenic

capital as well as new styles of play, leagues, and trends.

Despite the early global identity of basketball, it was still very much understood as an American game, and U.S. dominance in the game from its inception through the early 1970s solidified this identity. Basketball has been likened to jazz by many who argue that the two cultural forms hold shared characteristics: a mix of individual improvisation and teamwork, a resulting tendency to challenge convention and expectation, as well as a uniquely American aura. A highly individualistic style of play is, in more recent decades, aligned with U.S. basketball, whereas a style emphasizing fundamentals and technical play has been identified as how the rest of the world plays the game.

The U.S. National Basketball Association (NBA) has, in the last 25 years, gained new power and popularity as a result of recruiting players from around the globe, balancing styles of play in the league and, in so doing, adding to basketball's growth. In many nations, particularly throughout Europe and parts of Asia, promising youths are groomed for professional play, replacing the normal school day with intensive training in basketball. Those who go through these academies hope to be drafted to the NBA, but many play in other national leagues, such as those in Spain, Serbia, and Lithuania, and often compete in the Olympics for their respective nations.

In recent decades, the game has opened up to include female players on an institutional and professional level. The Women's National Basketball Association (WNBA) has largely thrived since its inception in the United States in 1997 and has contributed to the increased demand for the sport by involving women and girls around the world over the last decade. Despite the recent boom in popularity, women's basketball has been an international sport for decades, as the FIBA has held an international women's championship every non-Olympic year since 1953, and women's basketball became an Olympic sport in 1976, with the Soviet Union winning the gold medal.

Much like the jazz diplomacy of the Cold War, the U.S. State Department now sends NBA stars across the globe to participate in programs for persons with disabilities and youth organizations or to teach basketball in Afghanistan, Iraq, and other nations.

NASCAR

The National Association for Stock Car Auto Racing, usually referred to as NASCAR, is a U.S. organization that sanctions specific automobile racing competitions with a fan base rooted in post-World War II Southern white working-class culture. As the name implies, racers use stock cars, identical to automobiles available to the buying public. Although NASCAR emerged in the United States, in recent years the sport has internationalized to a degree, attracting attention from other cultures and drawing increasingly diverse crowds within the United States itself.

NASCAR evolved in tandem with post-World War II car culture in the United States. The father of NASCAR was Bill France, who originally belonged to the NSCRA, or the National Stock Car Racing Association. France brought together the individual leaders of the numerous small racing associations that were active in 1947, and NASCAR was officially created on February 21, 1948. NASCAR grew out of the Southeast, though the race circuit spread to other areas. By 1960 the Daytona 500, in Daytona Beach, Florida, was being televised. The popularity of the sport grew steadily at this point. In the 1980s corporate sponsorship from Fortune 500 companies poured still more money into the sport. With increasing television coverage, individual drivers began to assume a movie star quality in the public eye. While during the 1980s NASCAR received as little attention by sports writers as bowling or soccer, by the turn of the twentieth century the sport claimed its own category on the *Sports Illustrated* Web site as well as ESPN and other media venues.

Until the 1990s, although NASCAR was drawing millions of fans, the sports establishment was slow to recognize the sport since it emerged from working-class Southern roots. The media stereotype was not wholly incorrect, as can be gathered from the difficult history of NASCAR's dealing with issues of racial diversity. Not only were most of the fans white and working class, but the drivers themselves were nearly all white until recently. Likewise, women have yet to become a force in the NASCAR world as drivers. At NASCAR events, as at U.S. college football games, there are almost always many fans outside the

INTERNATIONAL AUTO RACING

- 1903—In a planned Paris-to-Madrid automobile race, 200 automobiles participate. Numerous accidents, injuries, and a total of eight fatalities ensue, including the death of Marcel Renault, one of the three siblings who founded Renault Brothers. The race is cancelled when the drivers reach Bordeaux, and open road racing is temporarily banned in France.
- 1904—The Fédération Internationale de l'Automobile (FIA), forms; in addition to advocacy, it becomes the main governing body for auto racing.
- 1906—Ferenc Szisz wins the First Grand Prix race held at Le Mans, France, traveling at an average speed of 62.88 miles (101.17 kilometers) per hour in his Renault during the two-day road race.
- 1909—The Automobile Club of America sponsors a 4,000-mile New York-to-Seattle automobile race. Ford No. 2, one of Henry Ford's Model Ts, wins the race in 22 days with an average speed of 7.76 miles per hour. Four months later the race committee rules that the Ford team committed fraud, and the prize is awarded to the Shawmut.
- 1911—The first Indianapolis 500 is held in the United States. Winner Ray Harroun averages 74.59 miles (120 kilometers) per hour for the 500-mile race.
- 1926—The first world championship is initiated for manufacturers, with qualifying rounds based on Indy 500 and Grand Prix circuit results.
- 1948—The National Association for Stock Car Auto Racing (NASCAR) forms.
- 1948—Following World War II, Grand Prix adopts new regulations for car weight, engine capacity, and so on, creating Formula One and Formula 2 categories.
- 1950—The World Driver's Championship is created for Formula One racing.
- 1954—The British Stock Car Racing Association is founded.
- 1972—R. J. Reynolds Tobacco Company sponsors the Winston Cup, infusing capital and new cachet in NASCAR.
- 1977—Janet Guthrie, one of the car drivers cultivated by the Macmillan Ring-Free Oil Company's "Macmillan Ring-Free Motor Maids," is the first woman driver to enter the Indy 500.
- 1990—Dutch driver Arie Luyendyk's sets an Indy 500 record win at an average speed of 185.981 miles (299.307 kilometers) per hour. Luyendyk wins the 500-mile race by only 10.7 seconds.
- 1992—Female race driver Lyn St. James is voted the Indianapolis 500 Rookie of the Year.
- 2008—The FIA agrees to regulate planned Formula Zero races that will feature high-speed "go karts" powered by hydrogen fuel cells.

—Fred Nadis

track stadium, where an active tailgate culture (centered on parking lot beer and barbecue parties) perseveres.

To a degree, NASCAR has been diversifying ethnically and internationally. The informal color line for NASCAR was broken by African American driver Wendell Scott, who raced from 1961 to 1973. He drove in 495 races, winning 1 and finishing in the top ten in final standings for several seasons. There have been very few black drivers since Scott. In the words of NASCAR historian Joe Menzer, "too many of the circuit's insiders could not see past the Confederate flags and dollar signs . . . even as the sport continued to spread throughout the United States and further

distance itself from its moonshine roots in the Deep South." Indeed, while interest in NASCAR has diversified regionally and through social strata, many in the media continue to refer to NASCAR voters as white, conservative, and rural based.

Although the upper level of competitions that count toward the Nextel Cup are all still held in the United States, NASCAR has held allied races in other countries, such as South Africa, Mexico, and Japan. There are parallel organizations arising internationally as well, such as CASCAR in Canada (though these are not sanctioned by NASCAR). The sport has been internationalizing in the United States as well. Traditionally,

only U.S. automobile companies entered or sponsored NASCAR vehicles. In 2007, Chevrolet, Ford, Dodge, and other American makes were joined by Toyota. Another recent development, indicating NASCAR's growing cosmopolitanism, was the sport's acquisition of a former Formula One and Indy Car driver of Latino heritage, Juan Pablo Montoya. Montoya, a Colombian, has excited the growing Latino fan base in the United States and worldwide. The main ESPN station in the United States carried Spanish-language coverage of a 2007 Mexico City NASCAR Busch

series race, further evidence of the increasingly global reach of the sport.

■ Introduction: Film and Television since 1945

While the early technology for television reception and broadcasting was developed during the 1930s, television as a mass media did not develop until the post-war era. In the West, particularly the United States with its commercial model for financing, television helped define a generation of baby boomers who grew up with its entertainment genres, news, and commercials. As newspapers continued to shrink as a viable media in the 2000s, television, with all its flaws, along with computer blog sites, has become the main vehicle for journalism with 24-hour coverage; 24-hour satellite, multiple cable channels, and computer streaming (YouTube, Hulu, TiVo) create a near infinite stream of information available to institutions and individuals. As with the film industry, television industries during this period were often nurtured with state funding, ensuring that East German broadcasting (with its very limited commercials) was quite different than that in the United States. National boundaries, however, are far from impermeable, and despite shielding efforts such as the Chinese government's Great Firewall of China that blocks Internet sites, access to alternative coverage of news of the world is far easier than in the past. Commerce also encourages transnationalism: the telenovelas (or soap opera serials) of Brazil and Mexico have become world commodities, with enormous audiences across the globe in-

cluding Eastern Europe and Russia. South Korean soap operas have also become popular in Japan and North America. Mirroring heavy industry, most North American animation production has shifted to countries such as India, South Korea, and China.

World Film, Post-1945

Following World War II, international cinema invented new genres and style conventions. Among the innovations were Italian Neo-Realism, French New Wave, the Cold War cinema of communist nations, new national cinemas and industries, and numerous action genres. These and a heightened interest in experimental art house cinemas were all by-products of renovations in experiencing, studying, and sanctioning the 100-year-old seventh art.

Although experimentally founded by Russian filmmaker Dziga Vertov in his 1920s concept *Kino Pravda* (Cinema Truth), Italian Neo-Realism emerged as a narrative style among the ruins of Italy's cities following World War II. The term "Neo-Realism" was first critically applied by Antonio Pietrangeli and Umberto Barbaro to Luchino Visconti's *Ossessione* (1943). Visconti's style was bereft of artifice and offered an unadulterated plot, authenticity in design, location shooting, and a lyricism in direction. Akin to the later

documentary film movement of cinema verité (cinema truth), popularized in the 1960s, Neo-Realism accented observed street reality as opposed to imaginative gloss. Throughout the 1940s Neo-Realism was the staple of the Italian cinema. Roberto Rossellini's *Rome, Open City* (1945) also expressed the style, which was to endure until Giuseppe De Santis's *Bitter Rice* (1949) transformed Neo-Realism into a commercial cliché. While Italian cinema returned to escapism, Neo-Realism influenced world cinema and such movements as cinema verité and the French New Wave.

World War II's military devastation of France left its cinema enthusiasts yearning for new artistry. From 1958 to 1960, French theorists and directors developed the Nouvelle Vague (New Wave), which was, unlike Neo-Realism, not a cohesive movement but rather a conglomerate of talent, focused on the criticism of André Bazin and Jacques Valcroze in their magazine *Cahiers du Cinema*. Their new theories were brought to the screen by young directors such as Claude Chabrol, Francois Truffaut, and Jean-Luc Godard in personalized films bereft of Hollywood gloss or expected filmmaking traditions. The New Wave fostered the spirit of independent filmmaking; the genre peaked in 1962 and had faded by the early 1970s when a new generation of Hollywood filmmakers also turned to gritty realism. Engendered by similar budget limitations, Neo-Realism and the New Wave were two sides of the same coin: artistry relying on the everyday, the unglamorous, the frank, and the spontaneous as opposed to the glamorous, the painted backdrop, and the fantasy of escapist film.

Films of the New Wave directors and other world-class directors such as Akira Kurosawa, Yasujiro Ozu, Ingmar Bergman, and Federico Fellini became standard fare in 1950s art houses, or small cinemas where countercultural, obscure, underground, and experimentally directed films have been shown to discriminating audiences. Many of the films also have been associated with the great film festivals: Venice (the first, in 1932, as part of the Biennale, following the war), Berlin, Moscow, Karlovy, Cannes, Edinburgh, Cork, London, Rio de Janeiro, Sundance, and San Francisco. There are also particular genre festivals worldwide.

➤ INTERNATIONAL FILM FESTIVALS

Film festivals began in the 1930s as a way to showcase film as an art form. The first film festival was held in Venice in 1932, and the most prestigious film festivals are still held in Europe (Cannes and Berlin are among the other famous film festivals). The international festivals challenged the global influence of Hollywood studio products and sought to return film from entertainment to art. Traditionally, the festivals catered solely to European directors, but the festivals have become even more international in scope. In the last couple of decades, special interest film festivals also have been created, such as festivals dedicated solely to animation (for instance, Zagreb) and student films, the most famous being the Fresh Film Festival in Karlovy Vary, Czech Republic, and the Ivy Film Festival in Providence, Rhode Island. There have been some criticisms that the old established film festivals, especially Cannes, are becoming more commercialized. Supporters argue, however, that with the breakdown of the studio system the lines between Hollywood, independent, and globally financed cinema have become more blurred.

Outside the art house, the Cold War led to Red Scares in Hollywood and the nationalistic bravado and anxieties expressed in 1950s westerns and science fiction horror movies in the United States. International tensions were also highlighted in the film industries of communist nations. From the official division of the two Germanys in 1949 until their reunification in 1990, East German film dealt primarily with Marxist ideology, human toil, and Teutonic history. Slatan Dudow's *Our Daily Bread* (1949) and Gunther Rucker's *The Best Years* (1965) are alternating examples of the routine issues in this communist sector: Marxist propaganda and human struggle, respectively. Because of their heavy propagandistic quotient, these films' distribution was internationally slight except for Andrew and Annelie Thorndike's *The Archives Testify* (1955) series, which exposed existing Nazi lore and dossiers. The Thorndikes' *The Russian Miracle* (1963), a collaboration with Russian filmmaker Esther Shub, became East Germany's most heralded film. Unlike the famous UFA (Universum

Film Aktien Gesellschaft), Germany's earlier national film association DEFA (Deutsche Film Aktien Gesellschaft), which lasted from 1917 to 1945, operated as East Germany's film association until the Berlin Wall fell in 1990.

Disparaging the historic greatness of its own early cinema, Stalinist Russia often oppressed filmmakers and set strict propagandistic guidelines for all the arts. Vsevolod Pudovkin's *Admiral Nakhimov* (1946) was suppressed, for example, as were the later works of Sergei Eisenstein, while Mikhail Romm's *The Russian Question* (1948) was praised for its Stalinist posturing. After Stalin's death, the Soviet film industry began to revive. Grigori Chukrai's *The Forty-First* brought auteurism (personalized statements) afresh to the Soviet Union in 1956. The 1960s Soviet cinema brought to the screen great literature and/or figures as a staple, for example, the female director Larissa Shepitko's *Heat* (1963), the Armenian Sergo Paradjanov's *Shadows of Our Forgotten Ancestors* (1964), and Andrei Tarkovsky's *Andrei Rublev* (1966). With the Soviet Union's demise in 1991, Soviet films were replaced by filmmaking in the independent republics via private financing. The Federation of Independent Filmmakers Union replaced the old Soviet Filmmakers Union.

Before the close of World War II in China, the invading Japanese used Chinese actors and technicians to produce some fine film fare such as *Sorrows Left at Spring River* (1940) by directors Hiroshi Inagaki and Yeuh Feng. After the war the pre-republic period began, with films expressing China's heritage and history such as *The Bridge* (1949) directed by Wang Pin. However, in 1949 the Maoist regime nationalized filmmaking through its Ministry of Culture. Its first product was *The Victory of the Chinese People* (1950), directed by Liu-Pai-you and Leonid Varlamov in collaboration with Soviet technicians. The films were propagandistic, instructing viewers about the brutality of capitalism while offering revisionist history and underlining the need of workers' revolutions. *New Heroes for Heroines* (1950), directed by Shih Tung-shan, and *The East Is Red* (1965), directed by Li Shuang-shuang, range from nationalism to pageantry celebrating communism, respectively. Before Mao Zedong's death in 1976, 480 features, 3,000 newsreels, and

1,400 shorts were produced by the Cultural Revolution's Chinese Film Workers Association.

Postwar commercial action film genres include Japanese samurai films, the related U.S. western, the Italian spaghetti western, and the kung fu genre of Hong Kong. The Japanese samurai film became an international success with Akira Kurosawa's *Seven Samurai* (1954) in which warriors defend a peasant village using swords and the ancient ethic of the samurai warrior. The film, which won the Grand Prix award and an Oscar for best foreign film, was adapted by U.S. director John Sturges into the hit *The Magnificent Seven* (with gunfighters as the samurai) in 1960. Other samurai films followed. Italy reinvented the western genre when Sergio Leone created the spaghetti western, a slang term for a gritty, rough film that offered violent homage to the Hollywood western and to samurai films, whose plots they freely borrowed. Clint Eastwood found fame as "the Man with No Name" in Leone's *For a Few Dollars More* (1965) and *The Good, the Bad, and the Ugly* (1966). An onslaught of films with other actors followed in Italy, Spain, and Germany. Leone's masterpiece, *Once upon a Time in the West* (1968), signaled the end of the genre.

The Hong Kong kung fu film, which began despite some governmental suppression in the 1930s, sprang to world prominence in the 1970s. The genre's first international star, Bruce Lee, championed martial arts and anticolonial themes in his B-films of unending action and violence, which appealed to Western audiences. More recently, Jackie Chan has formed his own industry built around the genre of *wuxia* (mystical sword-play), emphasizing comedy as well as martial arts fights.

The filmmaking industry of India has blossomed since the 1940s. The industry, based in Mumbai (Bombay) and now referred to as Bollywood, has in recent years created 900 works per year. In theme, the films are melodramatic routine thrillers concerning love triangles, comedy, and dare devilry. Some of the best known are musical extravaganzas filled with dancing and songs and often based loosely on India's mythic narratives. Bollywood's output fills the subcontinent's roughly 13,000 theaters, catering to audiences that speak 1,600 dialects in 16 languages.

While Hollywood still dominates the world market, since 1945 filmmaking has continued its globalization. The death of the Hollywood studio system in the 1950s gave rise to outside financing and to nonstudio-based filmmaking with flourishing production centers throughout the world. Whereas studios once exclusively produced their own films, now financing for projects comes from banks, individual financiers, and countries themselves. With the common film in 2006 costing some \$65 million—and a blockbuster \$200 million in U.S. dollars—filmmakers go where they can for financing, and that brings in globalization.

—Larry Clifton

Cold War Ideology in U.S. Films—Westerns, Thrillers, and Containment Culture

During World War II and the immediate post-war era, Hollywood reflected the transformation of the U.S. national character from isolationism to internationalism. Cold War ideology enveloped filmmaking as the industry sought to defend itself against accusations of communism from the government and private organizations such as the American Legion. This compelled the film industry to embrace the emerging post-war consensus, which grew out of the wartime experience of cooperation among government, business, and labor. The industry's self-defense gathered enormous steam in the late 1940s—especially after the House Committee on Un-American Activities (HUAC) was invited to Hollywood in 1947—as anticommunist rhetoric attacked anything critical of America, including its capitalist economy. Thus, the head of the Motion Picture Producers' Association, Eric Johnston, informed the Screen Writers Guild: "We'll

➤ RED DAWN

Director John Milius's *Red Dawn* (1984) portrays a nightmare scenario of Cold War ideology: the invasion and occupation of the United States by the Soviet Union. The takeover begins while students suffer through a visibly boring high school lecture about Mongol history. Meanwhile, the town of Calumet, Colorado, is invaded by Russian and Central American commandos who quickly give the town a Soviet facelift, including propaganda posters, a reeducation center at the old drive-in theater, and the (free) showing of *Alexander Nevsky* (1938) at the local movie theater. During the initial invasion a group of high school students escape to the mountains, where they form a guerrilla resistance group named the Wolverines. The students eventually wreak havoc on the seasoned Soviet and Latin American troops. Domestic Cold War ideology courses through the movie, notably where the Cuban commander Bella tells a Soviet KGB (Committee for State Security or *Komitet gosudarstvennoy bezopasnosti*) agent to retrieve information on gun owners at the sporting goods store, an explicit jab at liberal gun-control advocates. Internationally, the policies of the Reagan administration appear validated, as Cuba and Nicaragua take over the U.S.-supported El Salvador and Honduras, leaving Mexico to fall like a domino to communist revolution. Meanwhile, a second set of dominos falls as the Green Party takes over West Germany, leading to the dissolution of NATO in the face of Soviet aggression. The only reference to the United Nations is the analogously blue color of the Russian Special Forces' berets.

—Daniel R. McClure

have no more *Grapes of Wrath*, we'll have no more *Tobacco Roads*. We'll have no more films that show the seamy side of American life. We'll have no pictures that deal with labor strikes. We'll have no more pictures that show the banker as villain." Films overlaid Cold War ideals into the storylines and themes of movies, embedding Cold War ideology into genres such as westerns, thrillers, and dramas.

Overtly anticommunist films included movies such as *My Son John* (1952), which portrayed the family as a bulwark against the communist

Scene still from *Shane* (1953), starring Alan Ladd (left), Van Heflin, Jean Arthur, and Brandon De Wilde. (Paramount/The Kobal Collection)

menace that appeared in the guise of a son who is a communist agent. These films, however, usually suffered from low budgets and performed poorly at the box office. Anticommunist messages reached far wider audiences through more popular genres such as westerns. Director George Stevens's western *Shane* (1953) portrays a family-oriented settler and his homesteading community's struggle against an authoritarian cattle baron. The film's two male heroes present two alternatives to society: the nuclear family-oriented husband (Van Heflin), who fights when pushed, and the loner individual (Alan Ladd), whose violent fighting skills serve the causes of family and justice. Together, these two heroes save the community and contain the threat against the homesteaders' livelihood.

During the 1950s, thrillers sometimes incorporated science fiction to portray the anxieties of an America facing possible nuclear annihilation or communist takeover. The sense of being overwhelmed by elements larger and more powerful than society permeated through films such as *Them!* (1954), a movie in which the terror comes from atomically mutated ants and their superior social organization as a stand-in for communism. Movies about aliens reinforced the suspect nature of intellect and intelligence, thus making the scientist in *The Thing* (1951) as suspect as the killer alien itself. Finally, the film noir thriller *Kiss Me Deadly* (1955), a movie centered

on the exploits of virulently anticommunist private investigator Mike Hammer, projects the manly toughness one needs to survive, especially within the storyline that ultimately involves a nuclear device that is to be sold to an ambiguous foreign buyer, who could be assumed to be a communist.

One of the quintessential films of the 1950s exploring gender roles at the height of the Cold War is *Rebel without a Cause* (1955) starring James Dean, a rebellious son of suburban parents who often witnesses his mother ordering around his unsure father. Containment culture emphasized the role of the husband as the leader of the household through his ability as the breadwinner, while the wife's role included the domestic management of the household, including the proper nuances of raising children. In raising sons, wives attempted a precarious balance between attentiveness and over-attentiveness, with the latter possibly leading to the creation of weak, sissy adolescent males who might not possess the stamina to fight off the temptations of communism. Family conflict explodes during a scene in which the father appears in an apron while failing to offer to Jim (Dean) sound, manly advice for his adolescent problems. Upon the dramatic conclusion, the father admits his faults and asserts that he will try to become the father Jim needs: "Come on, Jim, stand up. I'll stand up with you. I'll try to be as brave and strong as you want me to be." The stated message, a family without a strong father and with a mother who rules over the men, creates unstable family networks that can lead to chaos.

Reflecting the extreme opposite of the post-war consensus was *Salt of the Earth* (1954), the product of the Hollywood blacklist. Made independently and in cooperation with the International Union of Mine, Mill & Smelter Workers, the movie tells the true story of a mining town in New Mexico whose workers go on strike after safety conditions at the mine go unattended by the owners. As a movie that portrays everything mainstream Hollywood hoped to steer clear of, *Salt of the Earth* was plagued by vigilante violence on the set as well as hostility from the Hollywood American Federation of Labor Film Council and the American Legion. Because its creators were victims of the blacklist, they were

able to make a film outside of the Hollywood system that gave them the freedom to explore themes that Hollywood abandoned in the Cold War age of consensus.

Popular Indian Cinema

India has the world's most prolific film industry, with an annual production of 800–1,000 films in a variety of languages. Of these, around 200 films, each lasting nearly three hours and replete with songs, dances, and spectacle, are made in Hindi in Bombay (now Mumbai) and known as Bollywood films. With their Pan-Indian and international reach, they dominate the cultural scene in India.

India's first indigenous silent film, *Raja Harishchandra*, was made by D. G. Phalke in 1913. In the 1930s, with the advent of talkies, major studios were created including New Theatres in Calcutta (now Kolkata), specializing in screen adaptations from Bengali literature; Bombay Talkies in Bombay whose forte was romance; and Prabhat in Poona (today Pune), specializing in social melodramas. Until 1934, when the first studios were constructed in southern India, many Tamil- and Telugu-language films were also made in these studios.

The end of World War II saw the emergence of independent producers. These producers, recognizing the importance of screen stars as valuable marketing commodities, lured them away from the major studios with offers of generous

➤ D. G. PHALKE

D. G. Phalke (1870–1944) is revered as the father of Indian cinema. Impressed by French director Alice Guy's silent film *Life of Christ* (Gaumont, 1906) and enthused by Mahatma Gandhi's swadeshi movement, Phalke, a professional photographer and patriot, decided to make the first Indian film.

Pawning his wife's jewelry to raise funds, in 1913 Phalke made *Raja Harishchandra*, based on a famous story from Hindu mythology. The film, with special effects inspired by French magician-turned-filmmaker Georges Méliès that lent themselves perfectly to depictions of divine intervention and miracles, was such a resounding success that with the profits Phalke established the first Indian studio, Hindustani Film Company, in Nasik. He ran the enterprise like a patriarch of the Hindu joint family: the actors and technicians lived in the same house, while he took responsibility for all aspects of the filmmaking process. All of Phalke's subsequent feature films were made here and based in Hindu mythology.

Other filmmakers followed Phalke's lead and took the stories of gods and goddesses, kings and queens, from Hindu mythology as their subjects. Thus, the mythological film was the Indian cinema's first-ever genre and still survives, mostly on television.

Unfortunately, Phalke's style of filmmaking was overtaken by sound technology and the new studios, and this pioneer of Indian cinema, like the French film pioneer Georges Méliès, died in penury.

—Asha Kasbekar

remuneration. With no overheads associated with maintaining a studio and no actors and technicians on regular payroll, they soon ruined the studios, opening the industry to new production companies.

By the time India achieved independence from Great Britain in 1947, the Indian film industry was already flourishing with films made in most regional languages, and the 1950s marked the golden age of the Bombay-based popular Hindi cinema. The burgeoning metropolis saw a crowding of national talent and produced some of the best films in its history. Four important directors of this golden age were Raj Kapoor (*Awara*, 1951), Mehboob Khan (*Mother India*,

Poster advertising the Bollywood movie *Mother India*, a Mehboob Khan masterpiece released in 1957 during the Golden Age of Bollywood. The tale of a peasant woman's heroic efforts to keep her family intact, *Mother India* is considered a classic of Indian cinema and was the first Hindi-language film ever nominated for an Academy Award. (Corbis)

1957), Bimal Roy (*Madhumati*, 1958), and Guru Dutt (*Pyaasa*, 1957) working with actors such as Dilip Kumar, Dev Anand, and Raj Kapoor himself and actresses such as Nutan, Madhubala, Nargis, and Meena Kumari.

Elsewhere in India, a new genius was emerging in the person of Satyajit Ray (1921–1992), the greatest Indian film director, known only in Calcutta and his native West Bengal until his film *Pather Panchali* (1955), the first of the Apu trilogy, won acclaim at the Cannes Film Festival. Ray and his body of work were to inspire the future art house films, or parallel cinema.

The advent of color in 1960 heralded the dominance of romance in Bombay cinema, with

songs and dances choreographed in spectacular settings that enhanced the persona of the stars. One of the earliest was *Mughal-e-Azam* (K. Asif, 1960), a pseudohistorical romantic extravaganza made partly in color that holds the same iconic status in Bollywood as *Gone with the Wind* in Hollywood. Later, formulaic romances were churned out by S. Mukherjee's Filmistan starring Shammi Kapoor (*Junglee*, 1961), the "Indian Elvis."

In 1960 the Indian government set up the Film Finance Corporation (later the National Film Development Corporation) to subsidize low-budget films, and in 1961 the government created the Film and Television Institute of India, resulting in fine artistic films such as *Bhuvan Shome* (Mrinal Sen, 1969) and *Uski Roti* (Mani Kaul, 1969).

In the 1970s a pair of unknown screenwriters, Salim Khan and Javed Akhtar, suddenly burst upon the Bombay scene with a series of action-packed melodramas such as *Zanjeer* (Prakash Mehra, 1973) and *Deewar* (Yash Chopra, 1975), which marked the meteoric rise of all-time superstar Amitabh Bachchan. Their *Sholay* (Ramesh Sippy, 1975), a *masala* western inspired by Clint Eastwood and spaghetti westerns, broke all previous records at the box office.

However, by the 1980s the action-packed films of Salim-Javed (as they were known) and their imitators had run out of steam. The nation was in political turmoil, and its economy was in crisis. With the introduction of color television and the expansion of terrestrial networks, the urban middle classes stayed at home to watch broadcasts. The habitually precarious finances of the film industry were now even more uncertain. Ominously, the Indian mafia muscled into the financing of films to launder their profits.

Meanwhile, the artistic inheritors of Satyajit Ray came into their own with a crop of low-budget films such as *Ankur* (Shyam Benegal, 1974), and by the 1980s Malayalam film directors such as Adoor Gopalakrishnan, G. Aravindan, and John Abraham, all from the southern state of Kerala, were at the vanguard of parallel cinema, with Abraham even starting a film cooperative, the Odessa Collective.

Bedeveled by economic woes, the Indian government liberalized the economy in 1991. For the

first time, cinema was given the status of an industry in 1998 and with it access to bank and other forms of regulated loans. Although national film subsidies were discontinued, several state governments began to offer grants for regional-language films. Some states offered tax incentives for the construction of new multiplex cinemas, and thanks to their proliferation in the new shopping malls, new films made with smaller budgets for niche audiences began to emerge.

Today, the expatriate Indian populations (particularly in the United States and the United Kingdom) are major markets accounting for half the total box office receipts. Big stars such as Shah Rukh Khan, Aamir Khan, and Aishwarya Rai continue to dominate the Pan-Indian and expatriate markets. The Oscar-nominated *Lagaan* (Ashutosh Gowrikar, 2002), with its plot of colonial exploitation and cricket, was an all-time hit. Meanwhile, Hollywood, despite the lifting of import restrictions and the dubbing of U.S. blockbusters into Hindi, continues to hold less than 10 percent of the crowded national Indian market.

Television and Its Impact on International Culture

Television is a powerful and a controversial medium. Almost from its very inception in the 1930s, the impact of television has been subject to debate. Would this new audiovisual medium deliver on its promise of promulgating education and culture, or would it be an outlet for advertising consumer goods?

In the United States, the first network television show, a 30-minute variety show, was broadcast by NBC (an RCA affiliate) on July 7, 1936. During the same time period (the 1920s and 1930s), scientists in Europe and Japan were conducting research and experiments in television technology and, by the end of the 1930s, had begun broadcasting. In Great Britain the London

Family watches television in the living room of their home, about 1958. (National Archives)

Television Service was inaugurated in 1936, while Japan Public Broadcasting Company began in 1937. Large industrialized countries in Asia, such as China, India, and Indonesia, established their own broadcasting infrastructure and programming in the late 1950s and early 1960s.

Worldwide, the rate of development of television as an industry varied greatly between industrialized and evolving nations. By the end of the 1980s, television broadcasting had been introduced into practically every nation on the planet. During this period there was much debate in non-Western nations about the impact of television, especially the impact of programs based on Western cultural values and sensibilities. Nearly half a century later, this debate continues. A brief overview of the history of television reveals the positive and negative influences that this medium has had worldwide on national identity, intellectual freedom, the exportation of U.S. popular culture, and finally the reinterpretation and repackaging of that culture.

The story of television as mass media begins in the mid-1940s at the close of World War II. In the United States, the postwar era was a time of industrialized might and suburbanization. Along with a growing middle class and new housing came a growing desire for consumer goods. This period of prosperity coincided with and helped to give rise to the popularity of American television programming and a stylized American

SATELLITE TELEVISION BROADCASTING TIMELINE

- 1957—Sputnik, the first satellite to successfully orbit the Earth, is launched by the USSR.
- 1962—Telstar, the world's first communication satellite, is launched from Cape Canaveral on July 10.
- 1972—In the United States, the FCC deregulates the domestic satellite industry with the Open Skies decision. Private companies can now use communication satellites for broadcasting.
- 1975—HBO broadcasts “The Thrilla from Manilla” (heavyweight championship fight between Muhammad Ali and Joe Frazier) via live satellite feed. This marks the birth of pay-per-view TV.
- 1978—America's Public Broadcasting System (PBS) introduces Public Television Satellite Service, the first system to use satellite technology for all its program delivery.
- 1980—Ted Turner launches CNN, the first 24-hour news channel. CNN revolutionizes television by providing an all-news format and featuring a real-time feed of breaking events on an international scale.
- 1989—Sky News, Great Britain's first 24-hour news station, begins operation.
- 1991—CNN gives unprecedented access to the first Gulf War. CNN was the only TV news source with on-the-ground real-time coverage. Its success spurs competition in the 24-hour news broadcast field.
- 1996—MSNBC, Fox News, and Al-Jazeera (the Arabic language news station) all launch satellite news broadcasts.
- 1997—The British Broadcasting Corporation inaugurates BBC News 24.
- 2005—Russia Today, an English-language Russian-based satellite news service, begins broadcasting.
- 2006—Al-Jazeera English (the first international English-language news channel headquartered in the Middle East) and France 24 (the first French-based international news channel) each debut.
- 2007—The Iranian English-language 24-hour news channel, Press TV, enters the satellite news field.

—Vibiana Bowman

consumer culture. The American television industry of the 1950s, which borrowed heavily from the success of commercial radio programs, created the templates for network shows that are still used today: dramas, sketch comedy, game and variety shows, and situation comedies. While U.S. broadcasters originally emphasized live events and live dramas—with the perception that live coverage was the sphere in which television excelled—preproduced dramatic series grew in popularity.

While other industrialized nations, such as Great Britain and Japan, were producing quality, original programs, during the first few decades of television much of the rest of the world ran American shows as a staple of their broadcast day. It was less expensive for fledgling television broadcasting systems to import foreign shows from the United States and Europe than to produce their own shows. As a result, media critics voiced concerns about cultural imperialism, that is, the imposition of Western culture and values on the less prosperous nations by the more industrialized ones that were, in many cases, nations from which they had recently won political independence.

While it is true that television has served to promote consumer culture, most particularly popularizing and creating a world market for American consumer goods, television has also served to promote national identity in developing countries. In the evolving nations that make them available, U.S. and West European shows continue to be broadcast and continue to be popular. However, current media surveys show that audiences often prefer locally produced programming. These domestic shows, which reflect a region's own language, culture, and worldview, are more in tune with local public taste. The popularity of specific types of programs varies from region to region: in Central and South America, the *telenovela* (a serialized show with high drama and characters drawn from everyday life) as well as Spanish-language musical and variety shows draw large audiences; in Western African countries and Southeast Asian nations, shows that feature traditional folk dance and song as well as indigenous-language pop music groups are popular.

The popularization of a national language and identity has been one of the benefits of televi-

sion in developing nations. The use of a national language such as Bahasa in Indonesia and Swahili in Kenya, Tanzania, and Uganda in locally produced programs has furthered the cause of a national spoken and written language in these countries. Unfortunately, there is a downside, as evidenced in China. Putonghua, or Modern Standard Chinese, is the official language. It is unlawful for broadcasts to offer any regional dialects. Regional activists in China are concerned that since no media exposure is granted for their language, new generations will have less familiarity with the dialect, which will lead to its extinction.

Television broadcasting systems, infrastructure, and regulations vary from nation to nation. Broadcast networks may be commercial, government subsidized, government controlled, or some combination of the three. Access to international programs is dependent on domestic politics. More recently, the Internet and the World Wide Web have provided a worldwide audience access to global media. Through video-sharing sites such as YouTube, television programs become available almost as soon as they are broadcast. In countries such as North Korea and Iran with tight controls over media outlets and the Internet, access to international information and entertainment can be limited. While these and other totalitarian governments use filters and tracking programs to bar users access to media deemed culturally or politically unacceptable, activists and civil libertarians continually attempt to circumvent these barriers in order to access the information that television provides.

Sports and Television

Television presents itself as the medium that not only enabled sport to be shown to a wider public but also brought about its profound mutation. By the turn of the 1970s, households had access to television, and the sports spectacle met network expectations as popular entertainment, generating considerable financial profits. With a head start in the United States, television promoted professional sports that transformed the practice and images of sport.

Born in Europe and the United States in the late 1930s, television provided the first sports images during the 1936 Olympic Games organized by Hitler in Berlin. In the particular context of triumphant Nazism, the sporting demonstrations staged by the Nazi propaganda services were seen on small screens by a privileged 200,000. In all Western countries, the 1960s witnessed the development of television. By 1968 the number of TV sets in the United Kingdom stood at 14 million, while there were 13 million sets in Germany, 20 million in Japan, and 78 million in the United States. Generally state-controlled until the mid-1960s, television and programming subsequently came to depend on competition between profit-motivated private companies.

Functioning simultaneously as news, games, soap opera, series, or light entertainment, sports

Fans in Berlin watch Brazil's Gilberto Silva during a television broadcast of Japan vs. Brazil in the 2002 World Cup. (Flickr)

appeared to be the ideal medium for the television networks. Live broadcasts of championship finals of nationally popular sports, whether soccer in Europe or baseball, football, or basketball in the United States, hold great appeal for viewers. The major international sporting events, the Olympic Games or soccer World Cup, score highest in the ratings. Forty billion viewers in 200 countries followed the soccer World Cup in 2002.

International sports institutions, based from an ethical point of view on the principle of amateurism, nonetheless manage this financial windfall very astutely. The Olympic Committee or the sports federations, which own the broadcasting rights for the events they organize, preside over an all-out bidding war between TV networks. The growth in demand has meant that networks are ready to outlay considerable sums. Broadcast fees for the Rome Olympics (1960) amounted to \$1.2 million, while those for Sydney (2000) were priced at \$1.35 billion and for Athens (2004) at \$1.7 billion.

On the model initiated by the United States, television networks and sports clubs maintain strictly commercial relations. Sponsors are interested in the images of sporting heroes for advertising purposes, while the sporting spectacle depends essentially on the financial backing of television. In the United States, the three networks committed themselves in 1982 to paying the National Football League \$2 billion over five years. With its payments for broadcasting rights, American television covers two-thirds of the budget of the Olympic Games, whatever the organizing city. On a lesser scale, France airs four channels producing a total of around 60 hours per week of programs wholly dedicated to sport. The channels broadcast activities or events that are neglected by the networks, with certain sports such as soccer, tennis, or Formula One racing enjoying wider coverage by the media.

Such substantial investment demands a return. Television imposes its points of view and its rules on the sports world. Through its broadcasting choices (based on activity, club, personality, and so on), its angles of observation (such as camera shots and framing), the contents of the sound track, and editing decisions, the TV program conveys an incomplete and subjective view

of the sporting spectacle. Over and above the vector of drama that is live TV, technological developments and the array of techniques (multiple cameras, on-board cameras, steadycam, loupes, computer graphics, etc.) now available to televised coverage provide the viewer with the illusion of reality.

Television techniques and television's unique demands have transformed sports practices. With the gradual transformation of rules, the games have been adapted to fit television's broadcast time and its consumers' expectations. In addition to slower balls, tennis brought in tie-breaks to shorten sets. Volleyball has undergone a similar evolution. In many sports, the refereeing provisions under the original rulebook are being brought into question by proposals for video refereeing. The pursuit of profitability for sports has led to the introduction of commercial breaks at the expense of the natural pace of the game. In the context of international sports events, the competition schedules, particularly for the most important finals, are based on peak viewing hours in the countries paying the highest fees for rights.

Positive and negative aspects emerge from this association of sport and television. By promoting previously little known sports such as golf, television has undeniably contributed to the democratization of sports activities, bringing them to a wider audience. The small screen has brought cycling to the Americans and baseball to the Europeans. But sport still has more viewers today than practitioners. The growing impact of television may continue to create changes to the spirit and essential rules of sports.

The Latin American Soap Opera

Serialized soap operas known as *telenovelas* have dominated television production in Latin America for the last 40 years and have become an important global product. Mexico leads the way within the Spanish-language market, with the multimedia conglomerate Televisa's productions establishing a model of melodramatic, improbable plots concerning universal issues such as frustrated love, romantic betrayal, and revenge. The 1979 Televisa soap opera *Los Ricos También Lloran* (*The Rich Cry Too*) exemplifies this tradition, with a story line based on mistaken identities and unknown parentage that has been echoed in countless other Latin American telenovelas. *The Rich Cry Too* was Mexico's most successful soap opera and was sold to various countries including Russia, where allegedly two-thirds of Moscow's inhabitants tuned into it, in addition to the Spanish-language market.

The first Brazilian telenovelas frequently imported scripts from Mexico, Cuba, and Argentina such as TV Tupi's *O Direito de Nascer* (*The Right to be Born*), an adaptation of a radio soap by the Cuban writer Felix Caignet. Launched in September 1964, *O Direito de Nascer* established the popularity of the daily soap opera. The Brazilian TV Globo station, part of Rede Globo, the world's fourth-largest commercial media network, was established in 1964 and today dominates Brazilian television and the production of telenovelas. Since the 1970s Globo has exported its soap operas to some 130 countries throughout the world. In Brazil as many as five telenovelas are screened daily, six days a week, chiefly in prime time for six to seven consecutive months. They play a central social role in the lives of the majority of the population, particularly the literate and semiliterate poor, in a nation where there is one television set for every 4.5 inhabitants. TV Globo diversified the genre in the 1970s, broadening its appeal and target audience by combining melodrama with more contemporary themes. The writer Janete Clair's major success

➤ SALMA HAYEK

The TV comedy-drama *Ugly Betty*, starring America Ferrara as Betty Suarez, is an adaptation of a Colombian telenovela or soap opera *Yo soy Betty la fea* (*I Am Ugly Betty*) written by Fernando Gaitán. The show premiered on September 28, 2006, on the ABC channel in the United States and is coproduced by Mexican actress Salma Hayek, who appeared in it as the character Sofia Reyes and in a cameo role as an actress in a fictional telenovela watched by Betty's family in early episodes. Hayek began her own career in soap operas on Mexican television in the late 1980s and was perhaps Mexico's biggest television star before moving to Hollywood. She appeared in the telenovelas *Un nuevo amanecer* (*A New Dawn*) in 1988 and *Teresa* in 1989. In the hit U.S. TV show, the sweet-natured, unglamorous Betty has an unlikely job at the fashion magazine *Mode* in New York City, where she is surrounded but undaunted by the all-white world of fashion. *Ugly Betty* appeals to Latino audiences by including references to aspects of their cultures, including allusions to other Latin American soap operas, and by affectionately portraying Betty's family life in Queens. The casting of Ferrara (who is of Honduran descent) in the lead role also reflects a growing awareness on the part of major television producers of the 40 million U.S. inhabitants of Hispanic origin, and the show has effectively brought the Latin American experience to an Anglo-American audience, garnering a wealth of awards and countless fans in the process.

—Lisa Shaw

was *Selva de Pedra* (*Stone Jungle*), screened in 1972–1973, a love story that incorporated the topical theme of rural-urban migration and became one of the most popular Brazilian soap operas of all time. The 1973 telenovela *O Bem-amado* (*The Beloved*) was the first Brazilian soap opera to be broadcast in color and the first to be sold to other Latin American countries.

In the late 1980s and throughout the 1990s soap operas shown in Brazil in the 8:00 p.m. slot increasingly dealt with contemporary issues with political subtexts such as corruption, nepotism, and the enforced celibacy of Catholic priests.

O Rei do Gado (*The Cattle King*, 1996–1997), for example, dealt with the controversial issue of land reform. Brazilian soap operas feature predominantly white-skinned actors in spite of the fact that it is estimated that between 50 percent and 60 percent of the nation's population are of Afro-Brazilian descent. In 1994 the organization SOS Racismo (SOS Racism) sued TV Globo for racism in the prime time telenovela *Pátria Minha* (*My Homeland*) specifically for an episode in which a white boss insulted a black employee suspected of theft and the employee reacted submissively. TV Globo rewrote subsequent episodes to include advice on how to react to racism. Brazilian soap operas also became extremely popular not only in Latin America but also in Portugal in the 1980s and 1990s, inspiring new Portuguese-language soap operas in Europe and marking the introduction of words that were exclusively Brazilian into the Portuguese language.

Colombian telenovelas follow the basics of the Brazilian model, mixing comedy with melodrama but incorporating particular cultural (and often regional) allusions. The 1994 production *Café con Aroma de Mujer* (*Coffee with a Scent of Woman*) exemplifies this national tradition and proved to be a major hit beyond Colombia's borders in the rest of Latin America and among Latino audiences in the United States. An archetypal rags-to-riches tale, this telenovela focuses on the life of a worker in the country's coffee-growing region and evokes identifiable aspects of rural life. Colombia is also responsible for the 2001 production *Yo soy Betty la fea* (*I am Ugly Betty*), which was watched by some 70 percent of the country's population in addition to capturing the imaginations of more than 80 million viewers in Latin America and the United States.

Argentina and Venezuela are also heavily involved in telenovela production and export. Argentine productions are sold widely across Latin America and as far afield as Asia and Eastern

Europe. The first truly successful Venezuelan telenovela export was *Cristal* (1986), yet another rags-to-riches tale that achieved an audience share of some 80 percent in Spain. The other recurrent theme of mistaken identities provided the central plot device of *Kassandra* (1992) that was produced by the Coral television company in Venezuela and proved to be a hit in Eastern Europe.

The pervasive influence of the telenovela in daily life in Latin America is reflected in the blurring of distinctions between fictional plots and characters and reality. On December 27, 1992, Daniella Perez, one of the main actors of the 8:00 p.m. soap opera *De Corpo e Alma* (*Of Body and Soul*) being aired in Brazil, was murdered in the middle of the night in Rio de Janeiro. As rumors of the tragedy spread, the soap opera's fans were confused about whether this was true or a leaked story line of how Daniella's character, the heroine Yasmin, was to be killed off. Even more confusing, it soon became known that the prime suspect in the case was Daniella's costar in *De Corpo e Alma*, Guilherme de Padua. Four years later, in 1997, Padua and his real-life wife were finally imprisoned for this crime.

■ Introduction: Visual Arts and Architecture

The period following World War II included many movements in art and architecture often lumped together under the general rubric of the postmodern, a clear rebellion against the emphasis on rationality and the accompanying severe geometric designs of modernism and the International Style in architecture championed in the early twentieth century by architects such as Le Corbusier. Postmodern art and design has a cynical side in its rejection of the modernist agenda of improving the lives of average citizens through an austere art and architecture. Yet postmodernism also can be regarded as a continuation of the experimentation that began in the arts in the early twentieth century, with a continued emphasis on new media, perspectives, idioms, and the critique of the illusion of the canvas as a window. Political change also radically transformed arts in this period. For example, postcolonial art in regions such as India and Africa reflects, in part, a nuanced return to folk motifs and methods.

In architecture, the postwar cultural shift toward the automobile had an important impact on architecture in the developed world as suburban developments mushroomed and commercial architecture, in areas such as Los Angeles and Las Vegas, began to reflect an automobile-centered design, particularly through the use of enormous signs, neon, and dramatic pitched roofs facing thoroughfares. In a related development, stirrings against modernism stemmed, in part, from a popular form of postwar architecture in such arenas as Morris Lapidus's hotels in Miami Beach that appealed to the average person's desire for luxury and fantasy. Historian Thomas Hine has dubbed this the populuxe style. A more highbrow postmodernism developed in the designs of architects such as Michael Graves, and, more recently, Frank Gehry, who have rejected the austerity of Mies van der Rohe's steel and glass boxes for more playful architecture that might include a pastiche of historical quotations or explorations of new materials and odd juxtapositions. Perhaps even more dominant is the new vernacular architecture of urban and suburban sprawl with bland mini malls lining streets and

interchangeable fast food restaurants, adapted in a regionally inflected utilitarian manner in many countries. Concerns with environmentalism have also emerged as a new emphasis in design school curriculums.

The visual arts were marked by the postwar rise and fall of the high-modern style of abstract expressionism, centered on the art world of New York City in the 1940s and 1950s. This movement quite literally blended the earlier interests in purely abstract art with expressionism, a representational art that rejected naturalism for exaggeration and enhanced emotional force. An expressionist school developed in Mexico City after World War II with links to the New York City art scene. The New York movement divided into two categories. The action painters, that is, the gestural school typified by Jackson Pollock and Willem de Kooning, sought to express intense emotion with techniques such as large brush strokes and chance effects such as thrown paint or drips. The other school included artists such as Helen Frankenthaler and Mark Rothko more drawn toward color field, with its use of flat colors and simpler abstractions.

The 1960s Pop Art movement deflated the romantic view of artistic production as its products mimicked and commented on mass manufacture and commercial culture, perhaps most famously in Andy Warhol's rendering of a Campbell's Soup can and in the enlarged comic strip frames of Roy Lichtenstein that revealed the printer's dots that made up the visual field.

Experimentation has continued. Visual artists combine photography and painting, explore the possibilities of video art, create art installations (or general environments), turn to the pop idioms of graffiti art or Japanese manga, and even return to archaic equipment such as the daguerreotype and tintype photography. China has become an important new capital for modern art in the decades following the Tiananmen Square massacre. In a curious twist, in the post-Soviet age, artists trained in the Soviet Realist school in Russia and China also can be relied on to offer middle-brow consumers nonironic historical scenes rendered according to the tropes

of realism, and some expatriate artists have found a large market, for example, among lovers of scenes of the mythic American West.

—Fred Nadis

Global Art since 1945

The years immediately following World War II represented an affirmation of the migratory wave of European talent to the United States as European artists and intellectuals fled the ravages of the war in Europe. The postwar years thus represented the most dramatic artistic shift of the twentieth century and the rise to preeminence of American art as New York City became the world's dominant art center.

Continued experimentation, particularly in the United States where Dadaism, Surrealism, and Abstraction had found particularly fertile ground in igniting the American avant-garde movement, led to the development of a new artistic phenomenon in New York City known as Abstract Expressionism, the first uniquely American artistic movement to achieve global recognition. In

the United States this was the era of Arshile Gorky (1904–1948) and Hans Hofmann (1880–1966), the artists who would blaze the trail for the future advent of what would come to be known as action painting.

The European art scene of the 1940s remained for the most part a highly experimental one marked by forays into Neo-Expressionism, Concrete Abstractionism, Neo-Cubism, cinematic Neo-Realism, and Surrealism. This was also the era of Jean Fautrier (1898–1964) and Jean Dubuffet (1901–1985), two of the artists responsible for pioneering the path to the advent of Informal Art.

In Latin America, Mexico remained one of the predominant focal points for European artists and intellectuals fleeing in the wake of World War II. Many of the emigrants were attracted by the vibrant expressionist aftermath of the Mexican School and the lingering social impact of the work of the Mexican Muralists. The grotesque expressionism of José Clemente Orozco (1883–1949), in particular, would influence a young generation of artists in the United States who would go on to found the American Abstract Expressionist movement in the late 1940s and early 1950s.

American Abstract Expressionism encompassed two main styles, both of which were concerned to varying degrees with the surrealist notion of creative automatism, namely the immediate, spontaneous expression of creative ideas. One of these styles, sometimes referred to as Color Field, sought to embody the essential purity of a concept or idea in a restrained version of creative automatism (spontaneous expression), as exemplified by the work of Mark Rothko (1903–1970). The other branch of this movement sought to blur the formal lines between the figurative and the abstract in an unrepressed expressionistic manner in what came to be known as action painting, or Gestural Abstraction, and whose principal exponents can be found in the paint dripping technique of American Jackson Pollock (1912–1956), the father of action painting, and in the figurative violence of the Dutch Willem de Kooning (1904–1997).

In the early 1950s the first influences of American Abstract Expressionism reached Europe, although European artists had similarly arrived at

Study for a Portrait (about 1950), by Irish painter Francis Bacon. (Christie's Images/Corbis)

➤ IMPACT OF CHRISTIANITY ON AFRICAN ART

After decades of repressing traditional African religion and the art associated with it in the early colonial period, some later Christian missionaries in the mid-twentieth century began to encourage the mixing of Christian content with local art forms, thereby creating modern African Christian art forms rather than imagery that portrayed Christ and other religious figures as white Europeans. Africanized Christian art now flourishes throughout the heavily Christian sub-Saharan part of the continent, although some parts of these Christian communities still resist any art that seems to be related to traditional African religion.

In Rome by the 1930s Catholic leaders at the highest levels of the Vatican, anticipating the end of European colonial empires, belatedly discovered an appreciation of non-Western art. Foremost in articulating a new approach toward local religious art, Cardinal Celso Costantini, the head of the Vatican's directorate for missions, advocated the creation of indigenous Christian art forms to replace the widespread use of European devotional imagery in missions. At his urging, Pope Pius XII convened a landmark international exhibition of art from the mission lands in Rome in 1950. This general approach to adapting Christian religious content to local cultural forms and styles is called inculturation or indigenization; its goal is to remove European cultural imperialism from Christian evangelicalism.

The first missionary institution founded by a Catholic order for inculturation of Christian art in Africa began in 1947 and was staffed by the Society of African Missions at Oye-Ekiti in the Yoruba-speaking region of Nigeria. Despite its brief life (1947–1954), the Oye-Ekiti art workshop launched traditionally trained Yoruba artists in woodcarving, textiles, beadwork, and leatherwork in creating a modern Yoruba Christian genre. Overseeing the workshop and for decades afterward, Reverend Kevin F. Carroll (1920–1993) promoted local artists and the use of indigenous arts, music, and architecture in Christian worship in Nigeria.

In the ensuing years, skilled carvers George Bamidele and Lamidi Fakeye and weaver Comfort Christiana Ojo created many Yoruba Christian artworks, including an impressive nativity set for the Rome exhibition in 1950. Other Nigerian artists have also continued this modern Nigerian Christian art tradition, including Bruce Onobrakpeya and Joseph Agbana. In response to the dramatic expansion of Christianity in Africa, whose adherents multiplied from 9 million in 1900 to 380 million by 2000, many other artists have created a vast and varied body of African Christian art including Reverend Engelbert Mveng in Cameroon, Mwabila Pembe of the Democratic Republic of Congo, Elimo Njau of Tanzania, Charles Sekintu of Uganda, and Ben Nhlanhla Nsusha of South Africa.

—Nicholas J. Bridger

an approach to Gestural Abstraction. The work of the Italian Emilio Vedova (1919–2006) mirrors the spiritual chaos of the gestural experiments of his American contemporaries. The figurative Expressionism of the Irishman Francis Bacon (1909–1992) deserves special mention for the brutally insightful psychological imagery it brings to life.

Pop Art, a movement that originated independently in England and the United States in the late 1950s, would explode in the early to mid-1960s especially in America, given its culture of unabashed consumerism. Pop Art ultimately sought to proclaim its disdain for the expressionist concept of art as a vehicle of protest against oppression of the individual. Instead,

Pop Art, with some irony, celebrated the triumph of popular or mass media culture over the individual. Whereas Expressionist Art focused on society's oppression of the individual, Pop Art sought merely to revel in the individual's mindless capitulation to mass media, and any figurative elements in it are intentionally objectified and thus devoid of any human quality. Pop Art remains to this day one of the most influential twentieth-century artistic trends. Among its proponents are Americans Roy Lichtenstein (1923–1997), Andy Warhol (1928–1987), and Jasper Johns (b. 1930). An offshoot of Pop Art in the 1960s was Op Art, or Optical Art, a style that focused on the optical illusionism of surface kinetics and whose primary proponent was the

Hungarian Victor Vasarely (1906–1997), a man who could be said to have anticipated the impersonal graphic art of the computer age.

In the mid-1960s further experimentation in the tradition of Abstract Expressionism led to two singular movements, Minimalist Art and Conceptual Art. Minimalist Art focuses on the concrete seriality or regularity of a work's geometrical construction as its sole aesthetic basis. Examples of Minimalist Art can be found in the work of Donald Judd (1928–1994) and Carl Andre (b. 1935).

Conceptual Art focuses on the philosophical or creative concept behind a work of art instead of its mere physical or objective presence. In fact, the physicality of a work is seen as a mere by-product of the conceptual creative process. American Joseph Kosuth (b. 1945) is responsible for creating one of the purest and truest seminal statements of Conceptual Art ever with his work *One and Three Chairs*. In this work he uses three expressions of the concept of chair in order to show three different ways of conveying the reality of the conceptual idea of the object in question by means of the object, a photograph of the object, and a textual definition of the object. In the 1970s and 1980s Neo-Conceptual Art, Performance Art, Installation Art, Pop Art, and Graffiti Art all were at the forefront of urban artistic creativity.

The responsiveness of art toward social and political phenomena remained one of the characteristic qualities of postwar artistic activity. Yet since the 1990s the global art world has entered into an extremely pluralist postmodern period in which there seem to be no new or dominant artistic trends to speak of and in which even the impetus that art once had as a vehicle for social commentary seems to be in decline.

Outside the Western world African art since 1945 has remained deeply rooted in the vibrant and rich ancient folk traditions of the continent. In the areas south of the Sahara this folkloric tradition has been primarily reflected in the creation of utilitarian everyday objects such as baskets, bowls, combs as well as ritual masks and decorative objects. The accessibility of wood makes it a fertile medium for the representation of the traditionally three-dimensional, visually abstract iconography of the region. In the realm of paint-

ing, contemporary African art makes frequent use of Abstractionist techniques.

Indian art in the postwar era has been characterized by the fusion of Western and Asian art trends and styles. The founding of the Progressive Artist's Group in 1948 ushered in a new postcolonial era in the Indian arts, an era of increased exposure to foreign artistic influences, among them that of Western Abstractionism. India remains a locale of artistic experimentation, drawing on its rich popular culture and folkloric traditions.

In the Islamic world the postwar years have seen alternating waves of nationalist and religious fervor as well as sporadic exposure to and acceptance of global art trends, creating an atmosphere in which the traditionally nonfigurative Islamic art of calligraphy has become fused with shades of Western Abstractionism. This is particularly true among artists of the Islamic diaspora living in Western nations. Even to this day, there exists the tendency among Islamic artists to remain rooted in the rich Islamic tradition of the decorative arts.

The East Asian cultures share with Islamic art a rich tradition of calligraphy, China being a perfect example. Such is the masterful use of calligraphy in Chinese culture that these symbols often transcend the mere use of language and actually become artistic works of complex abstractionist depth. Oriental calligraphy influenced the Western Abstract Expressionist movement of the late 1940s and early 1950s. During the interwar years and in the postwar period, China and Soviet Russia developed some of the most dramatic and visually powerful Propaganda Poster Art in the world. This rich twentieth-century tradition of propagandist graphic art and design stands as a testament to some of the worst political turmoil and social unrest that the modern world has ever experienced. Contemporary art in China remains quietly and cautiously subversive since the cultural crackdown of 1989.

Japanese Pop Art seems to be among the most effervescent fields of artistic creativity currently thanks to the worldwide popularity of the Japanese anime tradition, a peculiar brand of Japanese cartoon animation, as well as the equally popular manga, a style of Japanese comics.

Postcolonialism and African Art

Postcolonialism in Africa began in the mid-twentieth century with the independence of Sudan in 1947, Ghana in 1957, Nigeria in 1960, and many others afterward. Colonialism had brought African traditional culture into contact with Western culture, and postcolonial African visual art still reflected these influences. There is no sharp distinction between colonial and postcolonial African visual art. Both have been classified as Contemporary African Art. During colonialism, many African artists went abroad to train, as opportunities for training in Africa were either scarce or unavailable. In the postcolonial period, many returned home to take over the teaching as well as the administration of art from the expatriate artists who had earlier dominated the scene. By the mid-1950s, many prominent African artists had emerged. The anti-colonial struggle that started during the colonial period continued thereafter with the growing concern of salvaging African visual art traditions that had been abandoned for Western visual art practices.

Across the African continent during the colonial period, many artistic groups, workshops, and formal schools initiated and propagated Western visual arts, some of which were anticolonial in their approach. By the postcolonial period, many powerful art groups with a Pan-African philosophy emerged. They sought to promote Africanity in African Art, and some of these groups encompassed literary and visual arts. In 1966 the First World Festival of Black Arts was held in Dakar, Senegal. Groups and workshops

SKUNDER BOGHOSSIAN—A DISTINCTIVE CONTEMPORARY ARTIST

Born in 1937 in Ethiopia, Skunder Boghossian was one of the foremost contemporary African artists. In his early period, he received informal art training in Addis Ababa and won the Haile Selassie Jubilee Exhibition prize in 1955. Boghossian studied in London and later in Paris at the École des Beaux Arts. His exposure to Parisian art life did not jeopardize his aesthetic expression, which significantly drew from African tradition. Boghossian exhibited his work in Paris in 1964 to critical praise. He was the first African painter whose work was purchased as a mark of honor by the Musée d'Art Moderne in Paris. Boghossian explored natural materials such as animal skins and tree barks for his surfaces. Thematically, his paintings manifested the infusion of myth and spirits. His painting titled *Boogie Man No2* shows a huge creature with an owl-like face; the figure that is held up against the sky is confronting several smaller creatures juxtaposed around him. The painting typifies the spiritual and mythological undertone that characterized Boghossian's works. He taught in the United States, where he died in 2003.

—Tolulope Lawrence Akinbogun

that emerged before and since that first festival included the Zaria Art School in 1953, the Mbari Art Workshop in the early 1960s, the Ori-Olokun Workshop in the late 1960s to early 1970s (Nigeria), Frank McEwen's Rhodesia Art Workshop in the 1960s, Pachipamwe workshops in 1980 (Zimbabwe), the Dakar School (Senegal) initiated in 1966, the Khartoum School in 1946 (Sudan), the Sisi Kwa Sisi in 1983 (Kenya), and the Vohou Vohou Group (Cote d'Ivoire) that first coalesced in Paris in the 1970s at the Ecole des Beaux-Arts.

In Sudan, the earlier efforts of the prominent Sudanese artists from the late 1940s to the early 1960s evolved into the Khartoum School, which became a local intellectual movement in colonial and postcolonial Sudan. One of the artists, Ibrahim El Salahi, situated his work in Islamic calligraphy. His works were characterized with motifs from Islamic art found on the baskets and calabashes of local Sudanese craftsmen.

Ethiopia had always been an independent country despite the Italian occupation during 1935–1941. Haile Selassie, the Ethiopian monarch, established the Addis Ababa Fine Art School in 1957. Addis Ababa, as the headquarters of the Organization of African Unity (now the African Union), helped to showcase African culture. The Addis Ababa Fine Art School thus became useful in the pursuit of this mission. The OAU engaged the services of Afewerik Tekle, an Ethiopian artist who created a magnificent stained glass project in 1959 at the OAU Headquarters in Addis Ababa. Another Ethiopian artist, Skunder Boghossian, became prominent in Ethiopia in the 1960s with works noted for their biological appearances. Boghossian researched the use of animal skin and tree barks as painting surfaces. The use of halos on sacred figures made his works *Twilight Braves* and *Black Emblem* reminiscent of Ethiopian icons.

In colonial and postcolonial Nigeria Ben Enwonwu (among other artists) who had training both in Africa and abroad, became prominent. His initial works were in a realistic style, whereas his later works were in an expressive stylistic stream as shown in his work *Anyanwu* (*Awakening*), among others. *Awakening* is a bronze sculpture made in 1956. It is a stylized figure with an elongated body. The figure projects forward, with the two arms stretched sideways from the elbow as if the figure is about to fly. Following closely the influence of Enwonwu were artists trained in the Zaria art school in the late 1950s and 1960s. Many of the Zaria art school graduates became very prominent in either art training or art practice. They were known to have been vibrantly Pan-African in their conceptual and stylistic approaches to art production despite the early European influence on the art program of the school.

Postcolonial African artists faced new problems as they worked through the new nations' and perhaps their own identity crises. It has not been easy to classify the works of the artists. Hence, contemporary African art classification has been the subject of polemics, and such debate is ongoing. Cornelius Adepogba devised four classifications based on new styles: discernible images of experiences and ideas; naive visions, encouraged and fossilized; abstraction beyond common understanding; and revisitation and

adaptation of traditional art forms. Other writers on African arts have used different parameters such as geographical zones, methods of training, media, chronological scales, and thematic approaches to categorize the new art.

The thrust of the patronage of contemporary African art since the turn of the twentieth century has been significantly Western. The artists have been exposed to global influence and materials that have changed their orientation and production, and thus they face criticism by their Western audience for digressing from their African background. In response, the artists claim that the new materials and new methods of art production have not changed their mind-set or individualism as African artists.

However, some contemporary African artists seeking relevance have strived to work along the line of the Western audience's preconceived and expected archetypal image of contemporary African art. Consequently, with all these fissures, the African artistic community has been beset with multiple identity crises. Today, the artists are sharply divided on issues of ideology, particularly the issues of postmodernism and the newer genre of installation art. Some African artists believe that African art should oscillate within its own artistic realm and ignore the dictates of the West, whereas other contemporary artists believe that African art should not be in isolation from the Western ideologies that are becoming global.

Soviet and Post-Soviet Art

Soviet art after 1945 remained rooted in the conception of Socialist realism of the 1930s. After participating passionately in the 1917 revolution, avant-garde artists enjoyed a brief period of state support, but after Lenin's death in 1924 and Stalin's subsequent rise to power, it became clear that Soviet art would take a more realistic and less experimental direction. Socialist realism was the official style in the arts, and leaders enforced this with greater or lesser rigidity until Mikhail Gorbachev's policy of *perestroika*, or reconstruction. Well into the 1980s, underground movements either confronted or avoided the influence of Socialist realism, and even post-Soviet art continues to grapple with this legacy.

In 1934 at the First All-Union Congress of Soviet Writers, Cultural Minister Andrei Zhdanov and author Maxim Gorky, among others, defined Socialist realism. According to Zhdanov, art must satisfy three points: it must represent the life of the worker, it must inspire the viewer to participate in the construction of the socialist state, and it must project an image of a positive socialist future. The name itself suggests that the art must also be realistic in its style and socialist in its subject matter. By adhering to realism, a nineteenth-century tradition of painting, Socialist realism remained visually clear, even to the illiterate and minimally educated. Avant-garde art, on the other hand, was dismissed as elitist and incomprehensible. The role of Socialist realist art was also fundamentally different from that of Western art. Because there was no longer a system of patronage or an art market, all art was created for the state and served a largely didactic function. In Stalin's words, artists were to be the "engineers of souls."

Beginning with a cultural thaw after Stalin's death in 1953, an underground movement of unofficial art formed in the Soviet Union. Artists who did not embrace Socialist realism had no chance of exhibiting their work or receiving state support. They were often persecuted and ran the risk of being expatriated. In the early years of underground Soviet art, artists worked independently and without contact with other dissidents. Two organized schools of unofficial art emerged in the 1960s: Sots Art and Moscow conceptualism.

Ilya Kabakov's installation *The Man Who Flew into Space from His Apartment* (1981–1988) expressing the desire for artistic freedom. (CNAC/MNAM/Dist. Réunion des Musées Nationaux/Art Resource, NY)

In 1972, Vitaly Komar and Alexander Melamid coined the term "Sots Art." Work of the Sots artists was based on the theory that in the absence of a free-market economy, the primary consumer product in the Soviet Union was ideology; Sots Art manipulated images from Socialist realism and Pop Art to highlight the marketing strategies of socialism. In *Gorbi* (1989), Alexander Kosolapov parodied Andy Warhol's recognizable portrait, *Gold Marilyn Monroe* (1962). By replacing Monroe with Gorbachev, Kosolapov critiques the celebrity status of political leaders in the Soviet Union. In order to fashion this critique of Socialist realism, Sots artists used not only familiar images but also the most prized media of official art: easel painting, posters, and sculpture.

As opposed to Sots artists, members of the Moscow conceptualist movement sought fragments of culture untouched by the communist regime. These artists favored art forms rejected by official art: three-dimensional painting, performance, and installation. Works collected under this term are diverse. The Collective Actions group recruited artists to participate in scripted performances, which could involve, for example, reeling in a seven-kilometer-long rope from the Russian countryside. Ilya Kabakov's installation *The Man Who Flew into Space* (1981–1988) is a mock-up of a Soviet apartment, wall-papered with political posters, with a hole in the ceiling

EMIGREE ARTISTS—KOMAR AND MELAMID

Vitaly Komar (b. 1943) and Alexander Melamid (b. 1945) met while studying at the Stroganov Institute of Applied Arts in the 1960s and first exhibited together at Moscow's Blue Bird Café in 1967. After Soviet officials bulldozed an avant-garde exhibition in which Komar and Melamid participated, the artists requested and received exit visas. They temporarily moved their families to Israel before resettling in the United States in 1978. The Ronald Feldman Gallery had shown their work in New York in 1976, establishing their international reputation before they arrived.

Komar and Melamid are best known as the founders of Sots Art. The series of paintings *Nostalgic Socialist Realism* from 1981–1983 is typical in its ironic attitude toward Soviet art. One work from this series, *The Birth of Socialist Realism* (1982–1983), shows a muse whispering in Stalin's ear as they sit in a space decorated with marble columns and red drapery. Despite their seemingly anti-Soviet stance, later works by Komar and Melamid also mocked democracy and capitalism. For the project *People's Choice* (1994–1997), they surveyed people's tastes in painting around the world in order to create different countries' Most Wanted and Most Unwanted paintings. Despite the nations' ideological differences, the results for America and Russia were strikingly similar. The Most Wanted paintings for both nations were realist landscapes peopled by figures and animals and at least one historical figure. In 1997, the artists traveled to Thailand to teach elephants to paint. Despite this joke on the art world, the resulting paintings were treated as art, included in the Venice Biennale, and auctioned by Christie's New York in 1999. Komar and Melamid ceased to work together in 2003.

—Alexandra Merley

and a catapult hanging from the room's corners. This work comments on the desire to escape from Soviet culture. At least artistically, this longing for freedom was fulfilled in the late 1980s.

Under Gorbachev's leadership, artists officially escaped the confines of Socialist realism. Liberty to explore artistic styles only increased after the collapse of the Soviet Union in 1991. Formally, post-Soviet artists have few common-

alities and explore film, photography, sculpture, painting, and performance. Regardless of medium, however, many continue to grapple with their cultural heritage. Vadim Zakharov's *The History of Russian Art: From the Avant-Garde to the Moscow School of Conceptualists* (2003) is an installation that represents the phases of Soviet art as a series of filing boxes through which the viewer can literally walk. With his *Cosmonaut* installation, Oleg Kulik references Soviet art in a more subtle way. His life-sized astronaut, suspended from the ceiling of a museum's interior, seems the next step in the adventures of Kabakov's man who flew into space. Despite his successful orbit, however, Kulik's post-Soviet cosmonaut cannot escape the confines of history.

Art in China, Post-Mao

The death of Mao Zedong (1976) affected contemporary Chinese art practice on a literal and a symbolic level. On the one hand, as Mao's successors, beginning notably with Deng Xiaoping, embraced an increasing liberalization of economic policies, artists in the People's Republic of China became freer to explore issues of national identity and subjectivity and to embrace Chinese modernity (*xiandai yishi*). On the other hand, the methods, modes of production, and distribution of arts changed radically for younger artists practicing in succeeding eras.

Art under Mao remained circumscribed by the official state doctrine of Socialist Realism, a style and attitude that reduced art to a form of party propaganda. Ultimately, such art operated on a public level and reconfirmed state ideology

and established power structures. Visual art defined Mao as the supreme cultural embodiment of Chinese culture and consciousness. Tang Xiaohu's *Forging Ahead in the Wind and Waves* (1966) exemplifies this attitude in the traditional category of oil on canvas. In addition, poster reproductions of Mao (1967), which focused on the head and face of China's leader, made the image of Mao a standardized one and an image more easily remembered and reproduced for party purposes.

During the Cultural Revolution, many artists were purged and killed, and many historical artifacts were destroyed. Chinese culture on a whole suffered. Nearly all indigenous forms of Chinese art as well as those of distinct ethnic groups or those associated with foreign religions, such as Islam, were subjected to destruction by the Red Guards, a mass movement of students and civilians mobilized by Mao to overthrow the old order and ideals of China.

It was not until the late 1970s in the years that followed the death of Mao that art practice shifted away from its state orientation. Questioning the dogma and ideology (*hong*) of the official art that had been championed by the Chinese Communist Party during the Cultural Revolution, artists turned to issues of subjectivity, the individual's relation to society, and the problem of alienation within a socialist society. Zhong Ming's *Sartre—He Is Himself* (1987) investigates not only notions of freedom and the philosophy of existentialism but also the effect of combining figural and abstract modes of presentation, two modes that have long been separated in twentieth-century aesthetic consciousness. By placing the figure of Sartre in front of an abstract background, Zhong brings together these two modes. Such experimentation represented China's first foray into the postmodern consciousness of the West as Chinese artists appropriated and made new disparate styles of the West.

Art historian Martina Köppel-Yang regards the period 1979 to 1989, from the reforms of Deng Xiaoping to the massacre of Tiananmen Square and the closure of the exhibition China/Avant-Garde, as the first wave of the Chinese avant-garde (*qianwei*). To a far greater extent, this avant-garde in China was supported on a national and political level by the state.

➤ INOPORTUNE: STAGE ONE

Inopportune: Stage One by Cai Guo-Qiang (2004), at the Massachusetts Museum of Contemporary Art. (Franz-Marc Frei/Corbis)

Since the mid-1990s, Chinese artists have participated in prominent international exhibitions such as the *Venice Biennale* (1993, 1995, 1999) and also *Documenta X* (1997). Participation in these exhibitions confirmed the rising cultural status of the Chinese artist in the West. Specifically, the work *Inopportune: Stage One* (2004) by Chinese artist Cai Guo-Qiang represents the crux of Chinese international art. By installing nine real cars suspended from the ceiling, Cai Guo-Qiang draws not only on the postmodern Western practice of installation art, which has developed since the 1970s, but also on the ancient Chinese practice of Feng Shui, a practice that, it is claimed, is inseparable from any understanding of political dynamics in premodern China. The nine cars, which are filled with neon light tubes, convey the impression of being still frames from a movie of a car exploding upward through the central atrium of the rotunda. Invoking the current climate of suicide bombings in the Middle East, particularly Iraq, Cai Guo-Qiang's installation demonstrates, physically as well as conceptually, the power of Chinese art to reflect and make an impact on Western modes of aesthetic presentation.

—J. P. McMahon

In contrast to earlier Socialist Realist art and portraits of Mao, Xiamen Dada's the *Burning Event* (1986) indicates radical changes in art practices, a shift from static representation to paradigms of process and performativity. On the afternoon of October 5, 1986, works exhibited in the Xiamen Dada exhibition at the Cultural Palace of Xiamen were intentionally set on fire and thus destroyed. This performance, that is, the *Burning Event*, paralleled developments in the West, most notably American art of the 1950s and 1960s, such as the Happenings of Allan Kaprow and the dematerialization of the art object by Sol LeWitt.

Between the years 1979 and 1989 (the years of the Chinese avant-garde) all did not move forward inexorably toward freedom and liberation of thought. Under the leadership of Deng Xiaoping, the state provided institutional support for artists; however, campaigns against the avant-garde, such as Against Bourgeois Liberalism (*zichan jieji ziyouhua*), caused inevitable setbacks in the avant-garde cause.

Following the massacre of Tiananmen Square and the closure of the exhibition China/Avant-Garde (1989), avant-garde production stalled. In the mid-1990s, the world witnessed a global diaspora of Chinese art and artists with exhibitions worldwide, such as *Fragmented Memory: The Chinese Avant-Garde in Exile* (New York and San Francisco, 1993). However, artists in China continued to wrestle with the legacy and image of Mao and the dominant effect that his idea had on the cultural, political, and artistic policies of China.

Modernist Architecture after 1945

After World War II, the modern style of architecture continued to spread, facing new challenges and taking on new associations. This transition was largely prompted by the closing of the Bauhaus in Berlin by Hitler's armies in 1933. Many of the designers associated with the Bauhaus, though, had left Germany earlier, following the successful reception of Henry-Russell Hitchcock and Phillip Johnson's 1932 exhibition of modern architecture at the Museum of Modern Art and its catalog, *The International Style*. While pre-war modernist architecture had been limited by technology, advances in materials and structures during and after the war, combined with the positive reception by capitalist societies such as the United States, propelled these simple forms to become the predominant style. Modernism continued as the main architectural form until the rise of the Pop movement in art, which inspired the key theorists of architectural postmodernism in the 1960s and postmodernism's further evolution beyond the 1970s.

Modernism, or the International Style, refers to a style of architecture that stated "form follows function" and valued a spare aesthetic without extraneous decoration. This machined aesthetic was minimal and highly functional and aspired to mass production and rational design. The movement was originally heavily tied to socialist ideology that related the machine aesthetic to social progress. Modernism was developed simultaneously in different regions of the world by architects such as Le Corbusier of Switzerland, working in France; Walter Gropius of Germany; Mies van der Rohe, also of Germany; Gerrit Rietveld of the Netherlands; Oscar Niemeyer of Brazil; Irving Gill of the United States; and Richard Neutra of Austria. Architects who have received less attention within the context of the International Style but were still part of the modernist project include Alexander Rodchenko and the other constructivist architects in the Soviet Union who grappled with a clear, rational design framework. With attention from museums and the media, the designs and aesthetic philosophies of modernism (if not the political and economic ideologies) spread further and became the domi-

nant style of the postwar period, though many people still preferred revivalist styles that referenced history.

The modernist style was characterized by flat-front curtain walls. Usually made of glass, these walls were not structural, that is, they did not support the buildings. Instead, a complex system of steel columns and beams supported the buildings, and the walls became protection from the cold and elements, much like curtains. These walls were often made of glass that spread light into the center of the building, which was made possible by the open plans for building interiors that used few walls.

The removal of structure—or the illusion of buildings freed from such constraints—became a common goal of modernist architects, who used glass, concrete, wood, and steel. Two prime examples are the Lever Building (1950–1952), designed by Skidmore, Owings, and Merrill, and the Seagram Building (1954–1958), designed by Mies van der Rohe and Phillip Johnson. Both appear as if simple glass facades. Today, the modern aesthetic is still seen in the work of Richard Meier, whose rational designs for the Getty Center in Los Angeles included pure rectangular forms, plays with light, and truth to materials, meaning that the textures and colors of the travertine and aluminum are shown without paint or other finishes that hide the beauty of the materials themselves.

In the 1950s and 1960s, modernism gave way to postmodern architecture and thought. Modernism's economy of form and materials tallied well with projects with low budgets and expedited schedules, including housing projects. When these projects failed, as in the demolition of the Pruitt-Igoe housing complex in St. Louis, Missouri, in the 1970s, critics such as Charles Jencks and Tom Wolfe addressed the style and design ethics rather than project limitations, claiming that modernist designs were inhuman and supported crime, among other things. In addition, modernism was accused of failing to acknowledge humanity, alienating users and inhabitants, and denying history. Since then, modern architects, like many of their postmodern peers, have tried to integrate humanity into the machine aesthetic through user-centered design,

and modernism continues to be the preferred style of many designers and consumers, including many corporations. Postmodernism changed the dominant style from modernism to one with greater eclecticism and representation, including historical referencing and pastiches.

Some architects retained modern aesthetic preferences after postmodernism, arguing that postmodernism only highlighted issues that were always integral to modernism but had been ignored, and they found the decoration involved with postmodern designs to be superficial solutions. These architects chose to continue in the modern style but with greater attention to social patterns, developing a sociology and psychology of space that could also be considered postmodern in approach, if not aesthetics.

Postmodernism in Architecture

The term “postmodernism” refers to wide-ranging aspects of contemporary art, economics, culture, and society. The sources of postmodernism include consumerism; the shift to service-based economies; globalization; the rise of knowledge as a commodity; the growth of the popular mass media such as radio, stereo, television, and the Internet; and an accompanying fragmentation of cultural authority. All these factors have become increasingly common from the second half of the twentieth century (1950s to the present) in industrial societies. With reference to art and architecture, postmodernism can be regarded as a rejection of the modern style, which emerged in the early decades of the twentieth century.

The modern style in architecture was characterized by the belief that form follows function and led to the prevalence throughout the industrialized world of rational design forms erected from materials such as concrete, steel, and glass. Visually, the modern style was characterized by sometimes large-sized horizontal and vertical planes from a central axis. Designers such as Frank Lloyd Wright (1867–1959) in North America and Le Corbusier (1887–1965), Walter Gropius (1883–1969), and Ludwig Mies van der Rohe (1886–1969) in Europe led the modernist movement. Seeking order and logic, modernism, in many respects, reacted strongly against a perceived prior disorder. Modernists also rejected the many revivalist movements common to the nineteenth century, such as the neo-Gothic and Beaux Arts movements in architecture, which turned to the past for authority.

Seeking both order and the new, modernists sought visionary, even utopian means to design buildings and to develop urban settlements. In such a context modern architects, such as those previously mentioned, felt compelled to remove problems associated with modern living and devised a socially motivated approach to architecture and planned communities. While it is not necessary to provide a treatise concerning the decline of modernism, the reworking and dilution of the formative principles of modern architecture had a number of design and cultural effects, including the mass production of styleless, standardized, functional designs, which over time made the concept of modern architecture predictable and less desirable to the general public.

Following World War II, both European and North American society at large and architects reacted against the modernist dogma typified by the view that form follows function and the seriousness with which modern architecture had been practiced prior to 1939. After 1945, architects not only slowly began to question the doctrine of modernism but also adopted a more playful, witty attitude within the design process. Whereas modern buildings displayed a sense of solemnity in their rationally composed facades and interior spaces, postmodern edifices embraced ornamentation and local references.

Postmodern architects left behind a purely functional approach and embraced an eclectic aesthetics and an architectural ethos in which form could be adopted for its own sake. Consequently, by the 1950s and 1960s, designers were able to not only compose new means to view design styles rejected by modernists but also to establish new spatial dynamics. Familiar shapes, facades, and details thus became woven into sometimes disordered, seemingly irrational architectural forms. As a consequence, postmodern architecture induces strong, sometimes provocative reactions ranging from delight to shock and disgust, particularly among modernists. Postmodernists, in turn, had struggled to understand why modernists propagated a design style they perceive as bland, soulless, and ultimately socially irresponsible; that is, it was not receptive to the values and tastes of common people.

As noted previously, postmodern architecture has accepted the use of historic design and cultural precedents within the design process, and this greatly sets it apart from modern architecture as typified by the international style. In addition, whereas modernism encouraged a standardized form of design and frugal construction costs, postmodernism has suffered from no such inhibitions and is seemingly proud to display different aesthetic references, forms, angles, surfaces, and construction techniques. By way of example, I. M. Pei's (b. 1917) pyramid entrance (1989) for the Louvre Museum in Paris combined the modernity of the steel frame and glass wall covering with a design form inspired by ancient Egypt, while Charles Willard Moore (1925–1993) found inspiration in Renaissance Italy when creating the Piazza D'Italia (1978) in New Orleans, Louisiana, a space representing the contribution of Italian immigrants to the building of the city. The Strip in Las Vegas, Nevada, may be the strongest contemporary example of a postmodern urban environment. Its hotel-casino buildings make great use of historic models that range from pyramids to historic Venetian public buildings dating from earlier centuries. Frank Gehry (1929–), whose works appear in the United States and Europe, may be the most well-known of all postmodern architects. His Guggenheim Museum (1997) in Bilbao, Spain, makes no visible use of

historic design and instead uses contorted design forms as a means to help promote urban renewal and diversify the townscape, in so doing helping to create a new local context.

To precisely date the onset of postmodern architecture is problematic. However, from the 1960s and 1970s a number of prominent schemes had been undertaken in Europe, Asia, and the United States by the likes of architects Hans Hollein (1934–), Aldo Rossi (1931–1997), Arata Isozaki (1931–), Daniel Libeskind (1946–), and Robert Venturi (1925–), a designer who altered Mies van der Rohe's modernist dictum that less is more to less is a bore. By the 1980s schemes such as James Stirling's (1926–1992) State Art Gallery in Stuttgart, Germany, and works by Frank Gehry (1929–) and Michael Graves (1934–)

such as the 1980 Portland Building in Portland, Oregon, maintained the initial postmodern momentum and in so doing provided new icons that are currently inspiring architectural practice in many parts of the world.

■ Introduction: Literature and Theater

As with the other arts, world literature and theater following World War II are remarkably diverse. Nevertheless, post-war trends do emerge, aligned with political developments such as postcolonialism (as formerly colonized peoples explored via literature and criticism historical identity and worldviews) as well as intellectual movements such as Marxism and existentialism (with its absurd worldview yet hopes for individual human agency). Growing consumerism also affected the development of genres and the act of reading.

In the 1960s, accompanying the antiauthority vision of the youth counterculture, experimental literature (or metafiction) came to the forefront, with its ironic pastiche of genres, word games, and often revisionist assaults on nationalist mythologies. The theater and literature of this period explored themes and causes as wide ranging as human rights, sexual inequality, and gay rights.

If the 1960s counterculture critiqued technology, the genre of science fiction often celebrated it and explored its implications. Throughout the Cold War and beyond, apocalyptic concerns

centered on technological, environmental, or biological disasters dominated science fiction literature. As adjuncts of consumer culture, other formulaic genre literature such as westerns, crime novels, and romances reached mass markets throughout this period. As the growth of new media encouraged a shift in popular tastes from pure text to image, Japanese manga and graphic novels became increasingly popular and were repackaged in film, television, action figure toys, and computer game formats. In a similar manner, stage musicals such as those of Andrew Lloyd Webber as well as Disney productions were marketed on a mass level through a variety of interlinked media and licensing arrangements.

—Fred Nadis

Theater of the Absurd

The term “theater of the absurd” generally refers to a number of remarkable and experimental dramas, many of them French, produced in the years following World War II. The futility of humanity's quest for meaning in an amoral, irrational,

➤ WAITING FOR GODOT

Samuel Beckett wrote his seminal work, *En attendant Godot*, between 1948 and 1949. He later translated it into English as *Waiting for Godot: A Tragicomedy in Two Acts*. The play was first performed in Paris on January 5, 1953, at the Théâtre de Babylone to generally favorable reviews. In the play, two sets of curious characters, Vladimir and Estragon on the one hand and Pozzo and Lucky on the other, wait and wait again for the arrival of a mysterious M. Godot, who never arrives. As opposed to a traditional linear narrative that reaches a resolution, Beckett twice leaves his characters at the same point and at the same place in which he found them. All the nonaction takes place on a minimalist set with one lone tree. Vladimir and Estragon wear costumes reminiscent of Charlie Chaplin. While their bowler hats and tight shoes are like that of “The Little Tramp,” their nonsensical actions and dialogue are unlike anything previously seen in vaudeville. At one point, the two contemplate hanging themselves with the idea that this might produce erections, but they decide that it’s better to do nothing. Pozzo and Lucky, the master and slave duo, alternate leading each other about by a rope. In the second act, they mysteriously reappear, struck blind and mute, respectively. Pozzo and Lucky depart, and the play ends with Vladimir and Estragon sitting beneath the tree. Both agree that it is best to go, and yet neither of them move. It is an apt demonstration of Beckett’s sense of the absurdity of the human condition.

—Justine D. Price

nonsensical world is often an underlying theme in these plays. While absurdist theater was never a formal movement or a prescribed style, absurdist plays are often notable for their assault on traditional theatrical conventions: many had no linear plots or intelligible dialogues, while others dissolved the time-honored fourth wall between the performers and the audience. The giants of this avant-garde movement were the Irish writer Samuel Beckett (1906–1989) and the French writers Eugène Ionesco (1909–1994) and Jean Genet (1910–1986). These playwrights shared a sense of the tragedy of the human condition with writers such as Albert Camus (1913–

1960) and Jean-Paul Sartre (1905–1980), the philosopher of existentialism. To this generation of playwrights, going the way of the absurd appeared to be the only choice left to them in the wake of the atrocities of World War II and the rise of totalitarianism.

The phrase itself was first used by the Hungarian scholar Martin Esslin in his 1961 work *The Theatre of the Absurd*. Ultimately, the phrase derives from Camus’s reference to the absurdity of modern conditions in his seminal 1942 work *The Myth of Sisyphus*. While absurdist theater was very much the product of modern times, Esslin argued that the appeal of the absurd had deep roots within theatrical and literary history. The *mimus* or the *stupidus*—those characters who cannot understand the simplest logic or linguistic construction—appear in Greek mime plays, Shakespearean dramas, and the Italian commedia dell’arte. In absurdist theater, however, these court-jester characters take center stage. *Ubu Roi*, by the French playwright Alfred Jarry (1873–1907), is generally considered to be the modern progenitor of absurdist theater. Jarry wrote the play while still in school, and Ubu, the central character of the play, a personification of Stupidity, was based on a schoolteacher to amuse Jarry’s classmates. The play itself caused a scandal when it premiered in Paris in 1896: it opens with Ubu shouting an obscenity at the audience.

While William Shakespeare (1564–1616) and Lewis Carroll (1832–1898) both made use of the inexplicable as plot devices in, respectively, *A Midsummer Night’s Dream* and *Alice in Wonderland*, for example, absurdist theater was necessarily different in its strategies and intentions. In his celebrated work, *Waiting for Godot*, Beckett used nonsensical dialogue and ambiguous character definition to prevent the audience from forming traditional, empathetic identifications with the characters. Beckett’s strategy was similar to that of the celebrated German playwright Bertolt Brecht (1898–1956), who used a technique called the alienation effect, or *Verfremdungseffekt*, a hallmark of Brecht’s epic theater. In Brecht’s hands, this effect was designed to break down the fourth wall, the foundational illusion of the bourgeois drama, and to force the audience to rethink rarefied notions of art by see-

ing Brecht's work as another product of labor. In contrast, in Beckett's stagings, the alienation between the audience and the characters was designed to give the spectators a heightened awareness of their own particularly modern situation. Unlike Brecht's epic theater, viewers of absurdist theater in general and Beckett's work in particular were not meant to come away with a particular moral or political point of view. While Brecht derived his ideas on alienation from his belief in Marxist theory, Beckett generally remained skeptical of organized political thought.

The absurdist playwrights of the 1940s and 1950s changed prevailing notions of the theater and expressed some of the uncertainties of the postwar rebuilding of Europe as well as Europe's period of evaluating and critiquing the rise of fascism. The consequences of the absurdist theater movement are far reaching. Absurdist tendencies can be seen in the contemporary work of the British playwright Harold Pinter (1930–) and in the American playwright David Mamet (1947–). The tactics of the theater of the absurd playwrights can be seen in radical performance art of the 1960s created by such artists as Robert Rauschenberg (1925–) and John Cage (1912–1992), who blurred the boundaries between art and theater and between performer and spectator.

Postcolonial Literary Criticism

Since its inception in the 1950s, postcolonial literary criticism has developed into one of the largest and most influential movements in academia. It originated in the field of literary studies as theorists began to offer alternative interpretations of works in the literary canon to show how European literature legitimized colonialism through its depictions of native subjects as inferior. Not limited to literary studies, today post-

➤ ORIENTALISM AND OCCIDENTALISM

Edward Said argues that Orientalism is a discourse that constructs the East as the opposite and inferior of the West. One response to Orientalism is Occidentalism, a discourse that defines the West in terms of its difference from the East. Drawing on stereotypes of the West as materialistic and the East as spiritual, Occidentalism has been used by scholars from both the East and West to critique Western culture as greedy and immoral. Many Eastern nations attempting to construct an alternative modernity distinct from the Western capitalist model instead have adopted an Occidentalist discourse; communist China and Islamism in the Middle East are two examples. In the West such Occidentalism is often derided as anti-Western or anti-American and conflated with violent reactions against the West.

Although they appear contradictory, it is commonly argued that Orientalism and Occidentalism are not opposites; rather they are counterparts or mirror images of each other. Both represent the world as polarized, harness essentialist stereotypes, and ignore similarities and moments of symbiosis between the East and the West. Many scholars question the applicability of these polarizing discourses. Especially as the East industrializes and globalization brings increased contact between cultures, making such sweeping distinctions between the Orient and the Occident becomes more difficult.

—Meghan Davison

colonial literary criticism is part of the larger field of postcolonial studies, which includes history, anthropology, women's studies, area studies, and other disciplines that strive to give voice to cultures and peoples traditionally omitted from academic discourse. Despite this expansion, postcolonial literary criticism continues to be at the forefront of postcolonial studies, as literature remains one of the best ways to examine colonial discourse and to challenge the Western domination of the production of knowledge.

As formal colonialism ended, writers and theorists began to deconstruct the methods used by the West to justify colonialism. In the 1950s Franz Fanon, Aimé Césaire, and Albert Memmi published critiques of colonialism that became

important texts for postcolonial literary criticism. However, it is Edward Said's *Orientalism*, first published in 1978, that is considered the foundational text. In *Orientalism* Said argues that the Orient is a concept constructed by the West as the opposite of the Occident. The notion of the West as modern, scientific, and powerful is bolstered by descriptions of the Orient as traditional, mysterious, and effeminate. Said examines literature and U.S. politics to show how this binary of Orient/Occident validates the need for Western domination. Following Said, theorists have examined works of William Shakespeare, E. M. Forster, and Joseph Conrad to show how literature is complicit with the project of colonialism.

In addition to reexamining Western literature, postcolonial literary theorists seek to undo Western hegemony by highlighting the works of authors who have traditionally been barred from academia. The last couple of decades have seen a wave of writers from former colonies win popular success and critical acclaim. Chinua Achebe and J. M. Coetzee from Africa, Salman Rushdie and Michael Ondaatje from Asia, and Gabriel García Márquez from South America have been celebrated for penning works that reflect the legacy of colonialism. Their work is generally referred to as postcolonial literature.

Identity is a prevalent theme in both postcolonial literature and its criticism. Said explores how colonialism creates binary identities. Theorist Homi Bhaba argues that colonialism generates hybrid identities, as the colonial subject strives to both imitate and reject the colonizer. Theorist Gayatri Spivak questions whether the colonial consciousness is recoverable in the face of elite domination. Not limited to the former colonies, this exploration of the identity of the subjugated also resonates with minority groups in North America and Europe. Feminists are particularly attracted to postcolonial literary criticism, as feminist theory is also concerned with issues of identity, representation, and marginalization and calls for a recognition of voices that are traditionally silenced.

One critique of postcolonial literary criticism is that although it is concerned with the developing world, it was largely generated in the West. Much postcolonial literature is printed only in

English, and many prominent theorists speak English and live or were educated in the West. For example, Said was born in Jerusalem but was educated in the United States at Princeton and Harvard universities. It has been argued that these theorists represent elite voices that cannot aptly challenge Western hegemony or speak for the majority of the developing world.

Another critique is that postcolonial literary criticism is not sufficiently nuanced. It tends to privilege the novel over other modes of writing, such as poetry. It subsumes the former colonies into a single category and thus ignores their tremendous geographical, social, religious, political, economic, and linguistic variety. As a result, contemporary theorists have begun to take a broader approach. Not only literature but also mass media, technology, and globalization are recognized as important aspects of cultural production. There has been a call for a renewed form of postcolonial literary criticism that incorporates the literary with other fields of study, especially economics and other social sciences, to better address current geopolitical trends.

Science Fiction and the Apocalyptic Imagination

Traditionally connected to religious or mythic motifs, apocalyptic thought focuses on the cosmic theme of the death or destruction of the

world and the birth of a new world. Historical examples would include the biblical tale of the Flood, the Norse legend of Ragnorak in which the gods and giants destroy the world, and all of Christian millennial thought (that is, thought associated with the Second Coming of Christ). However, for the past century, and even more tellingly since 1945 with the onset of the Cold War, the apocalyptic theme has been the centerpiece of science fiction literature, particularly with doomsday scenarios focused on nuclear warfare or ecological (rising seas, postoil scenarios, global warming) and biological disasters (genetic experiments run amok, strange unstoppable diseases, mutant ants) that threaten or mutate life on this planet or elsewhere. On the popular level the apocalyptic theme has often been interwoven with dystopian visions that point toward the end of the world as well as unexpected posthuman rebirths (the settling of new worlds in outer space, the development of new psi powers, the blending of humanity with alien species) as well as conspiracy theories that indicate distrust of governments and their nefarious and possibly world-destroying secrets.

British scientist and science fiction novelist Arthur C. Clarke's *Childhood's End* (1953) encapsulates nearly all of these themes. Set on contemporary earth with its Cold War machinations, mankind faces two challenges: first, the arrival of a superior race from outer space, the Overlords, who begin to oversee earth's affairs, and second, the development of new strange mental powers in many children. The Overlords are eventually revealed to be horned creatures reminiscent of images of Satan in religious literature, come here as extraterrestrial emissaries to witness the birth of a new species. Ultimately, the young humans of the planet transform into pure spirit and leave the earth behind, in a variant on the Christian rapture; their parents, not offered the same option and rendered sterile, choose to collectively commit suicide.

Childhood's End was set in a believable Cold War context but chose to skirt the nuclear arms race. Other literature did not. John Hershey's *Hiroshima* (1946), which began as a *New Yorker* series, charted the lives of people before, during, and after the bombing. Japanese author Masuji Ibuse's *Black Rain* (1965) chronicled the after-

➤ NUCLEAR CLOCK

The nuclear doomsday clock has been updated by the board of directors of the *Bulletin of the Atomic Scientists* at the University of Chicago since 1947. Its minute hand indicates the short distance to nuclear annihilation, represented by midnight. The number of minutes that it is set prior to midnight depends on global events that can potentially trigger global disasters, not just nuclear war. The closest the clock was to midnight was within two minutes in 1953 when the United States and the Soviet Union both tested nuclear weapons within nine months of each other. With the end of the Cold War in 1991, the clock was at seven minutes to midnight, which was its farthest distance to date.

—Abraham O. Mendoza

math of Hiroshima and its horrors on a human scale as an aging couple try to arrange their daughter's marriage and assure suitors that she was not exposed to radioactive fallout. Early science fiction in the United States, however, tended to celebrate the atomic bomb as a proof of the genre's prophetic vanguard nature and a positive proof of the increasing value of scientific research. The 1954 U.S. military hydrogen bomb tests in the Marshall Islands and the dooming of a Japanese fishing vessel crew from deadly fallout began to shift popular opinion to reassess the celebration of atomic power. Nevil Shute's *On the Beach* (1957) concerns itself with how the sole survivors of a nuclear war await the shift in winds and the fallout that will eventually kill them in Australia. Postapocalyptic stories that pick up humanity's story in a debased future, centuries following a nuclear event, also became common, with one of the first being Walter M. Miller's *A Canticle for Liebowitz* (1963). The absurdity of nuclear war and the theories behind survivable hydrogen bomb exchange scenarios was expressed in the 1964 dark comedy *Dr. Strangelove*.

Apocalypse via environmental destruction has a similar late-twentieth-century pedigree. British science fiction writer J. G. Ballard created a quartet of novels that envision apocalypse

emerging from each of the world's four primal elements: earth, water, air, and fire. Attempts at rebirth are often failed. Ballard's *The Drowned World* (1962), for example, offers a scenario in which global warming has led to a melting of the ice caps and the onset of a world of swamps and flooded cities in which survivors contend with modern-day looters who wish to drain the swamps to uncover treasures. In Ballard's scenarios, the postapocalyptic rebirth is stalled or stillborn, making his work, according to one critic, examples of an ambiguous apocalypse. Others followed this approach. A typical Philip K. Dick novel, for example, *The Three Stigmata of Palmer Eldritch* (1965), features a debased future world in which a devastated earth leads many to reluctantly immigrate to Mars colonies. On Mars, boredom and lassitude lead them to escape through a bizarre drug that evokes group hallucinations centered on the adventures of the Barbie-like "Perky Pat." African American novelist Octavia Butler's *Dawn* (1987) offers another ambiguous apocalypse. After the earth is devastated by nuclear war, a race of alien saviors, the Oankali, arrives but drives a difficult bargain. They can heal and cure people; however, they require human subjects to mate with their subspecies, the Ooloi, to propagate new species and gather up human genetic material to help advance their biologically based technology that includes a living starship.

Soviet science fiction, laboring under the Stalinist theory of limits, which encouraged authors to provide readers with uplifting solutions to near future problems, changed somewhat in the post-Stalin era. The brothers Arkady and Boris Strugatsky, the best known of the new Soviet science fiction writers, offered one secular variation on the millennialist dream in their novel *The Ugly Swans* (1967). A town's adults are not admitted to the secrets of the leprosarium, or nearby leper colony; the adults abandon the town. Their adolescent offspring discover the leprosarium is a semi-utopian realm of wonders shaped by its inmates, who are actually mutant scientists and who offer them a new spiritual perspective and education.

In addition to these ambiguous apocalypse scenarios, the recent fascination with conspiracy theories and the implied public distrust of au-

thority has underpinned a genre that might be called the hidden apocalypse. Such conspiracy concerns took on metaphysical proportions in the works of Philip K. Dick such as *Ubik* (1970), in which the heroes careen through a devolving world and belatedly learn that they are dead and cryogenically frozen, yet interlinked with the dominant mindscape of a cruel adolescent crypt mate. With a similar critique of the consumer society's encouragement of desire and pleasure, Polish science fiction writer Stanislaus Lem's *The Futurological Congress* (1971) describes a future world so bleak that everyone, including the future's technocratic planners, are bombarded with drugs to hide the devastation of the world. These drugs, or mascons, entirely mask reality and provide a more pleasing surface world.

Global warming, nuclear warfare, the waning of petroleum reserves, conflicts over water and oil, and the continuous disruption of modernity continue to prove hearty fodder for apocalyptic tales. Tim LaHaye and Jerry Jenkins's *Left Behind: A Novel of the Earth's Last Days* (1995) was the first in a series of 16 novels that offered a more traditional Christian description of the apocalypse. In contrast, Cormac McCarthy's *The Road* (2006) describes the journey of a father and son through a devastated near-future world that resembles a moonscape, prompting the father to remark of that landscape's significance, "There is no prophet in the earth's long chronicle who is not honored here today."

Magic Realism

Magic realism is a literary style that blossomed in Latin America after World War II and spread internationally from the 1960s. Its main characteristic is the combination of realistic elements with unusual situations and supernatural phenomena for the purpose of surprising and bewildering the reader. The elevation of everyday facts and characters, with recourse to exaggerations and marvels, permits the author to produce a fiction in which the local reality is represented and criticized in a way that is potentially accessible to a universal audience.

The expression “magic realism” was minted in 1925 by the German art critic Franz Roh (1890–1965) to praise postexpressionist painters who recovered an interest in faithful artistic representations of reality: with this meaning, it was used in visual arts until the 1950s. Nevertheless, as early as the second half of the 1920s the term was drawn on and popularized in literature by the Italian writer Massimo Bontempelli (1878–1960), who advocated discovering the magic and mythical component of modern everyday life. This is indeed the concept on which literary magic realism developed after World War II in Latin America.

In the prologue of the novel *El Reino de Este Mundo* (*The Kingdom of This World*, 1949), the Cuban writer Alejo Carpentier (1904–1980) introduced the concept of *lo real maravilloso* (“the marvelous real”) to indicate that Latin America, in particular in the regions where the influence of native and African cultures were especially strong, was characterized by an original atmosphere of magic and spiritualism that made the subcontinent a more vital place than Europe, which in his opinion was dominated by rationality. An early example of this approach to fiction is the novel *Pedro Páramo* (1955) by the Mexican Juan Rulfo (1917–1986) in which the protagonist, during a search for his lost father, interacts with the dead inhabitants of a ghost town as if they were alive.

The undisputed masterpiece of magic realism, which rendered this literary style world-famous,

➤ ONE HUNDRED YEARS OF SOLITUDE

The opening paragraph of the acclaimed novel *One Hundred Years of Solitude* by Gabriel García Márquez establishes some of the defining traits of magic realism, such as an association between wonder and ordinary items, as well as an indefinite, malleable, nonhistorical time in which the plot is set.

“Many years later, as he faced the firing squad, Colonel Aureliano Buendía was to remember that distant afternoon when his father took him to discover ice. At that time Macondo was a village of twenty adobe houses, built on the bank of a river of clear water that ran along a bed of polished stones, which were white and enormous, like prehistoric eggs. The world was so recent that many things lacked names, and in order to indicate them it was necessary to point. Every year during the month of March a family of ragged gypsies would set up their tents near the village, and with a great uproar of pipes and kettledrums they would display new inventions. First they brought the magnet. A heavy gypsy with an untamed beard and sparrow hands, who introduced himself as Melquíades, put on a bold public demonstration of what he himself called the eighth wonder of the learned alchemists of Macedonia. He went from house to house dragging two metal ingots and everybody was amazed to see pots, pans, tongs, and braziers tumble down from their places and beams creak from the desperation of nails and screws trying to emerge, and even objects that had been lost for a long time appeared from where they had been searched for most and went dragging along in turbulent confusion behind Melquíades’ magical irons. ‘Things have a life of their own,’ the gypsy proclaimed with a harsh accent. ‘It’s simply a matter of waking up their souls.’”

Bibliography

Gabriel García Márquez. *One Hundred Years of Solitude*, translated from the Spanish by Gregory Rabassa (1970; reprint, New York: Perennial Classics, 1998), 1–2.

—Juri Bottura

is *Cien Años de Soledad* (*One Hundred Years of Solitude*, 1967) by the Colombian writer and journalist Gabriel García Márquez (b. 1927), who is also the most prominent exponent of the so-called commercial boom of Latin American fiction in the 1960s and 1970s. The domestic saga of the Buendía family in the archetypal village of Macondo (Colombia) showed all the crucial features of the magic realist novel: a break from the traditional unity of time, place, and action that leads to an epic narration; the construction of a family microcosm that was characterized by circularity and repetitiveness through generations; a number of supernatural and improbable elements that informed characters' lives in the most natural way; and a new reading of decisive moments of the national past through symbolic episodes that reversed the traditional interpretations imposed by the elites.

Magic realism continued to inspire Latin American writers well beyond the 1960s, as the international success of more recent novels such as *La Casa de los Espíritus* (*The House of the Spirits*, 1982) by the Chilean Isabel Allende (b. 1942) demonstrated. In particular, this innovative style, with its tendency toward a universal symbology, enjoyed a global diffusion in the last two decades of the twentieth century. In a world that had experienced the rapid process of decolonization and in which new nation-states were under construction, magic realism constituted an effective instrument of emancipation from the cultural authority of the West (and, by extension, from its political hegemony) in Asia and Africa as well. In novels such as *Midnight's Children* (1981) by Salman Rushdie (b. 1947) and *The Famished Road* (1991) by Ben Okri (b. 1959), the problematic colonial heritage of the home countries of the two authors (India and Nigeria, respectively) was represented through the supernatural and spiritual experiences of the protagonists. Works that have much in common with magic realism were also written in Europe and North America by experimental authors who reacted to, and reflected on, epochal collective tragedies of Western history. For instance, in *Die Blechtrommel* (*The Tin Drum*, 1959), the German writer Günter Grass (b. 1927) portrays the sufferings provoked by the Nazi regime and World War II through the family ups and downs

of an emotionally disturbed dwarf, writing his memoirs while in a sanitarium. In *Beloved* (1987), Toni Morrison (b. 1931) depicts the troubles that the mysterious, apparently supernatural character of *Beloved* inflicts on a black family recently escaped from slavery in the United States. Both Morrison and Grass were awarded the Nobel Prize for Literature in, respectively, 1993 and 1999.

Although magic realism always escaped a univocal definition and never was a structured artistic movement, the stylistic and thematic innovations that it introduced helped to open the global literary market and the Western intellectual scene to the cultural production of the emergent countries of Latin America, Asia, and Africa, giving a contribution to the shaping of contemporary multiculturalism.

Feminist Literature

Feminist literature is writing that centers on themes of women's oppression and might include poetry or prose, fiction, and nonfiction. Feminist writers may explore and address oppression by advocating for women's equality and critiquing patriarchy, sexism, and institutions that oppress women or by presenting voices and characters who challenge traditional roles of women.

The term "feminism" is difficult to define and has developed and changed over the past century and a half. In general, all feminist writers share a concern for the condition of women, particularly within patriarchal societies, cultures,

and institutions, and explore and present these concerns through various literary genres. Writers who are women are not necessarily feminist writers. Some writers identify themselves as feminist, while others might address women's oppression through their writing but may not align themselves with the term "feminist" due to its complex positive and negative connotations. Arguably, many feminisms exist and can be defined within the context of a range of variables that affect the condition of women. Politics, culture, economics, gender, and identity are only a few of the lenses through which feminist writers explore women's issues.

Feminist literature of the mid-twentieth century reflected women's concerns with inequalities in family, gender, race, and reproductive rights. During the 1960s and 1970s, often called second-wave feminism or the women's liberation movement, a rich body of literature emerged that revealed women's historical oppression and connected lesbianism with feminism.

During this period, French theorists (notably deconstructionists such as Roland Barthes and Jacques Derrida) described the concept of *écriture féminine* ("female writing") in which language is feminized, emotional, and closer to the body. Simone De Beauvoir (1908–1986) influenced a generation of feminist writers with her book *Second Sex* (1949) in which she explored the idea of women as "the other" and argued that patriarchy deprived women of freedom and that women should be treated as people rather than objects.

Other influential works of the women's liberation movement include *The Feminine Mystique*, published in 1963 by Betty Friedan (1921–2006). Her book brought to light the feelings of many middle-class American women who had lost their identities to their husbands and children. Friedan identified the "woman problem" as one in which women were influenced by advertising and social norms to be only housewives, a role that Friedan felt trapped and essentialized suburban women in particular.

Literature during the second wave of feminism explored not only women's oppression but also the intersection of racial and gender oppression in the lives of women of color. Audre Lorde (1934–1992) and Chandra Mohanty (1955–) criti-

➤ DORIS LESSING

Doris Lessing (1919–), one of Britain's most prolific writers, was born in Persia (now Iran) in 1919 and spent time living in Southern Rhodesia (now Zimbabwe). In 2007, Lessing was awarded the Nobel Prize in Literature (at the age of 87, she was the oldest person to ever win the literature award). Lessing's fiction, typically based on her own experiences, explores disparate subjects and themes including communism, Sufi mysticism, cultural clashes, individual and collective good, and social and racial injustice. Her work includes more than 25 novels (several in the science fiction genre), story collections, nonfiction, operas, plays, and a graphic novel. Lessing has been a social activist throughout her life, campaigning against apartheid and nuclear arms and, at times, being forcibly removed from South Africa and banned from Rhodesia. *The Golden Notebook* (1962) is considered a feminist classic and literary masterpiece. In this postmodern antiwar novel, Lessing tells the story of fictional writer Anna Wulf, who records the experiences of her life in her notebooks. The novel explores such themes as societal and mental breakdown, the Communist Party, and women's liberation. Lessing has said that her novel *Alfred and Emily* (2008) is her final work.

—Kim Kennedy White

cized 1960s feminists and writers such as Friedan for focusing mostly on the experiences of white middle-class women and thus marginalizing the experience of women of color or women in the Third World within feminist analysis and discourse. Toni Cade Bambara's (1939–1995) *The Black Woman*, published in 1970, was the first anthology that featured the works of black feminist writers and connected the women's liberation movement to civil rights. African American female writers explored the ways in which black women were marginalized from not only male culture but also white women's culture. African American writers who uncovered issues of black women's oppression, inequality, and civil rights in their work include Gwendolyn Brooks (1917–2000), who in 1950 was the first black woman to receive the Pulitzer Prize for Poetry; world-renowned poets Nikki Giovanni (1943–) and

Maya Angelou (1928–); Pulitzer Prize winner Alice Walker (1944–), for *The Color Purple* (1983); and Nobel Prize and Pulitzer Prize winner Toni Morrison (1931–). The landmark anthology *This Bridge Called My Back: Writings by Radical Women of Color* (1981) featured poetry and essays by writers such as Audre Lorde, Cherríe Moraga, and Gloria Anzaldúa that confronted racism within the feminist movement and voiced the struggles of women of color against homophobia and sexism. During this period, Gloria Anzaldúa also contributed *Borderlands/La Frontera* (1987), an influential work of Chicana feminism in which Anzaldúa mixed both prose and poetry to articulate a new hybrid, or *mestiza*, consciousness.

Feminist literature from the 1990s to the present, also called third-wave feminism, continued to broaden the understanding of feminism to include explorations of sexuality, race and ethnicity, queer and transgender theory, post-modernism, and critical theory. The work of contemporary feminist writers became more accepted into the literary canon as the readership of women's writing expanded. Elaine Showalter (1941–), in her groundbreaking literary critique *A Literature of Their Own: British Women Novelists from Bronte to Lessing* (1977), identified a rich tradition of women's fiction writing in England and brought forgotten writers back into the light. Her work has brought to light not only feminist literature but also feminist literary criticism and what she terms "gynocritics," or literary criticism from a feminine perspective.

Chinese Americans Amy Tan (1952–) and Maxine Hong Kingston (1940–) explore issues of cross-cultural experiences. Tan examines mother-daughter relationships such as those in her most well-known work, *The Joy Luck Club* (1983), and Kingston's memoir, *The Woman Warrior* (1975), is among the most commonly taught texts in universities. Other feminist writers who explore culture include Ana Castillo (1953–), who writes about Chicana feminism. Chilean American Isabel Allende (1942–) has written about the experiences of women through magical realism, a genre in which magical elements invade realistic settings, and has made significant contributions to Latin American literature. Margaret Atwood (1939–), the prolific and renowned Ca-

nadian writer of *The Handmaid's Tale*, continues to be an outspoken feminist and social activist, her writing diverse in subject matter and spanning multiple genres including science fiction.

Other contemporary American feminist writers who write about female identity, marginality, and sexuality, particularly lesbianism, include Adrienne Rich (1929–), one of the most influential poets in the second half of the twentieth century; novelists Rita Mae Brown (1944–) and Dorothy Allison (1949–); and contemporary poet Jennifer Baumgartner (1970–). Gloria Jean Watkins, better known by her pen name bell hooks (1952–), poet and activist, has explored race, class, gender, and media in her works including *Ain't I a Woman? Black Women and Feminism* (1981) in which she examines the impact of sexism and racism on the status of black women.

Contemporary feminist writers span the globe and explore the intersections between gender, society, ethnicity, and individual identity. Outside of Europe and the United States, feminist literature has also made significant inroads in presenting issues of concern to women of the developing world. Kenyan environmentalist and political activist Wangari Muta Maathai (1940–) writes about the importance of environmental conservation and women's rights in an African context. Her work in advocating for Green Belt Conservation made her the first African and environmentalist to win a Nobel Prize in 2004. Calcutta, India, native Bharati Mukherjee (1940–) examines the struggles of women in her home country, while Judith Ortiz Cofer (1952–) explores the dynamic between female empowerment and machismo in Puerto Rican culture. In the Middle East, feminist authors such as Egyptian Nawal El Saadawi (1931–) discuss issues of importance to Muslim women, such as genital mutilation and criticism of patriarchal systems; Iranian expatriate Marjane Satrapi's graphic novel series *Persepolis* (2003) described her own coming of age against the backdrop of the Iranian revolution, the Iran-Iraq War, and restrictions on freedom under the new regime.

Literature in the Soviet Bloc, 1945–1990

While the introduction of the communist political system to Eastern Europe did not lead to a cultural revolution as in China, socialist realism quickly became the dominating art form in these countries for most of the 1950s and 1960s. Maxim Gorki's novel *The Mother* (1907), which tells the story of the failure of the 1905 Russian Revolution, is considered the archetype of socialist realism. It was also Gorki (1868–1936) who proclaimed that socialist realism, designed to capture the real-life experience of workers in factories and social affairs, would be the only fitting style for the new age of communism. Socialist realism influenced architecture, music, literature, and the production of movies. Most of the novels produced in this style took on the form of the bildungsroman (narratives that describe the moral growth and education of a main character) but with a focus on an individual worker who, initially skeptical of the new political system, experiences the superiority of that system and finally professes loyalty to communism.

After World War II, socialist realism spread to the nations of the Soviet Bloc. In 1952, the eminent poet and East German politician Johannes R. Becher (1891–1958) declared socialist realism to be the only acceptable art form for East German artists. Authors were encouraged to seek out contact with workers and experience factory work firsthand. The core of their writing was to reflect class struggle as the driving force of history. The quality of novels in this tradition, at least in the eyes of communist politicians, was measured not against their truthful representation of everyday life but instead against their truthful reflection of class struggle and the inherent message of the moral, economic, and social

➤ CHRISTA WOLF

Christa Wolf (1929–) is the best-known author from the German Democratic Republic. Wolf was born in the small town of Landsberg, which belonged to the eastern territories lost to Poland after World War II. Her novel *Patterns of Childhood* (1976) was one of the first literary explorations of individual Germans' guilt and responsibility for the Nazi past. In this autobiographical work, Wolf writes about her journey as an adult to her former hometown and connects this narrative with a discussion of her childhood memories from the days of the Nazi dictatorship and the very selective representation of Nazism in East German media. In *Patterns of Childhood*, Wolf considers the ways in which we learn to conform to social and political standards, which are questioned only at times of social and political collapse. Her book is thus not just about Germany's difficulties with the past but about the general phenomena of memory and forgetting.

—Thomas Adam

superiority of communism. From the beginning, socialist realism was hotly contested and produced conflicts between writers and politicians.

East German literature faced two unique challenges. It needed to include discussions about the Nazi past, such as in Dieter Noll's *The Adventures of Werner Holt* (1960–1963), and it also needed to discuss the problem of East Germans leaving for West Germany before the construction of the Berlin Wall (in 1961). Socialist realism thus led to the production of novels in which the reeducation of individuals occurs over a long time span often involving a misguided life before 1945. Furthermore, East German movies such as *Our Daily Bread* (1949) contrasted a hard but successful and morally superior life in the East with an easy and morally disastrous life in the West.

After the suppression of the Hungarian Revolution of 1956, pressure on intellectuals and poets to conform to the demands of socialist realism increased. While some authors left for the West, others such as Erich Loest (1926–) and Walter Janka (1914–1994) were imprisoned. The events of 1968 in Czechoslovakia forced many more authors into exile. The most prominent

was the Czech poet Milan Kundera, who gained worldwide recognition for his best-seller *The Unbearable Lightness of Being* (1984), which he wrote in French exile. This novel and his *Book of Laughter and Forgetting* (1979) deal with the events of the Prague Spring and its aftermath.

Science fiction, which flourished in the Soviet Union and the Eastern Bloc, allowed freer reign to ideas. Polish sci-fi author Stanislaw Lem (1921–2006) gained worldwide recognition for his writings. Although his first writings were in the socialist realist vein, he soon shifted to novels of ideas and satires. His books have been translated into 41 languages. The film *The Silent Star* (1960), based on Lem's first sci-fi novel *The Astronauts* (1951), was an East German-Polish coproduction and the only East German sci-fi movie ever shown in U.S. theaters, under the title *First Spaceship on Venus* (1962).

Throughout the 1970s and 1980s, Western media provided many East European authors an outlet in which to publish their banned works. Aleksandr Solzhenitsyn's description of the Stalinist labor camp system in his novel *Gulag Archipelago* was one such work. Written between 1938 and 1968, this monumental work was first published in Paris in 1973, and copies were smuggled back into the Soviet Union and circulated underground as part of the Samizdat literature movement. The East German writer Stefan Heym was also forced to publish his account about the popular uprising in East Germany on June 17, 1953, in the West. It appeared in 1974 in West Germany.

The easing of the tensions between East and West in the early 1970s led to significant changes in the conditions of the production of literature, especially in East Germany. The crude version of socialist realism of the 1950s was no longer held up as the norm, and Erich Honecker, East Germany's head of state, in 1971 insisted that there can be no taboos for art if one proceeds from a sound socialist point of view. This no-taboo speech enticed East German writers, who quickly took up his invitation. Christa Wolf had already been able to publish her highly praised short story *Quest for Christa T.* in 1968, thus introducing the topics of cancer and death to public debate. Irmtraud Morgner's *Trobadora Beatriz* (1974) questioned the level of female equality,

while Ulrich Plenzdorf's *New Sufferings of Young W.* (1973) focused on youth rebellion against society.

Throughout the 1980s, Soviet authors such as Tschingis Aitmatow (1928–2008) were permitted to point in their novels to Stalinist crimes and signs for the moral decay of communism. In his widely read book *Place of Execution* (1987), Aitmatow discussed drug trafficking and drug abuse, the destruction of nature, and Soviet bureaucracy and mismanagement.

Modern Islamic Utopian Literature

Although the term "utopia," which Thomas More coined to title his novel *Utopia* (1516), etymologically means "no place" (or "nowhere") and stands as a fictional portrait of an ideal imaginary society. The modern Islamic literary utopias belong to the contemporary world and describe a good life of timeless order. There are two types of modern Islamic utopias. The first group, which can be called quasi utopias, includes socially and/or politically charged texts with a utopian tone. A second group, limited in number, combines science fiction and the realms of utopia. All modern Islamic utopian texts refer to a past Golden Age of Islam as part of their critique of a contemporary fallen world.

In contrast with the major canons of utopian writing, the relation of this first group of Islamic quasi utopias with literature is indirect and stands between contemporary issues and the Islamic heritage that is shaped by the sciences of Kalam, Islamic theology, Tafsir, exegesis, and Hadith tradition. In most cases, the ideas and fantasies are told anonymously, commonly by a lay Muslim intellectual whose voice is firmly

► TURKISH ISLAMIC SCIENCE FICTION—SPACE FARMERS

Ali Nar's *Uzay Çiftçileri: Space Farmers* (1988) is one example of Islamic science fiction from Turkey. The main character is the astronaut Hasan II, who is part of an Islamic space mission that aims to gain new natural resources off the globe. The chapters of the novel each begin with maxims taken from the Quran or the hadith collections. The theme starts with Hasan II's grandfather's unpleasant encounter with modern technology—when as a little boy he was scared by an emerging train from a tunnel—preparing the reader for a comparison between the generations and their life conditions and attitudes toward modernity. The plot presents the Muslim astronaut as a modern young man with strong religious beliefs. When the Space Committee of the Islamic Federation in Aleppo starts gathering a team, Hasan II consults Hamit Molla, the imam of his village. The imam, who compares the space mission to Mirac, or Ascension, suggests to him a training program that resembles one required by the Islamic mystical paths. After this three-month-long training, which consists of conversation with his imam on *seriat*, the divine law, the succession of the prophet Muhammad, and mystical cognition, Hasan II's

shirt is burned during a mystical ecstasy, and he is awarded *abaya*, the clothing of the Sufi, as a sign of his progress. In the sixth chapter, after his internal Mirac he goes to Aleppo to enroll in the space program and ultimately becomes a member of the space mission Refref II.

Holy numbers and numerology add religious significance to the text, such as the assigning of a 24-member crew of the mission, while the 99 units of the shuttle parallel the names of Allah. One task of the crew is to discover the eleventh planet, which is mentioned in the Quran (surah 12/4). In the second part of the novel Hasan II breaks the rules of the mission and as punishment is forced to travel alone in a separate shuttle for seven days. During this period he gets lost in the fourteenth solar system and ends up landing on a planet, which he names *dünya II*, or second world. Scholar Christian Syzka, in his "On Utopian Writing in Nasserist Prison and Laicist Turkey," has noted that while exploring the second world Hasan II meets a number of legendary figures that are part of Islamic popular culture and witnesses apocalyptic images that are rooted in the hadith literature.

—Yücel Demirel

grounded in the contemporary world and who is convinced of being part of this utopian past. These quasi utopias, whether written as a newspaper article, part of the speech of an Islamist politician, or posted on a *dawa* Islamic Web site on the Internet, reflect the values of Islamic thought, highlight the hope for a better future, and point out solutions to current problems that are faced by Muslims.

A typical text that is told or written within this utopian discourse has two main characteristics. On the one hand, this world and its affairs are considered as a sort of dystopia, the bad place, in which the life conditions of Muslims are dreadful because of deprivation and oppressive social control that are caused either by the colonizing West or by local governments contaminated by the Western way of thinking. Consistent with the Islamic conceptualization of Islam as the so-called final religion and its prophet as the seal of the prophets, the utopian Islamic dis-

course describes the current situation of Muslims and the world in general as fatally flawed, based upon human evil and idiocy. The central features of the given framework appear as poverty, social discord, and antidemocratic governance. The texts critique a highly hierarchical social and political structure in which social and economic forces are incapable of changing the fate of the Muslim people. In addition, forces such as globalization, technology, and the media are represented as the instruments that strengthen the subordination of the Islamic world.

The main theme of these quasi-utopian Islamic responses is a return to the values of the Golden Age of Islam (seventh to fourteenth centuries), the era during which Muslim scientists and physician-philosophers contributed extensively in philosophy and science. These quasi utopias are created, then, to foster a moving force against contemporary discord. While on some occasions the utopian text visibly fuels the

political Islamic movement to undermine the prevailing social and political system, in others they employ a more covert language for a more pragmatic political agenda. In the latter, one might see how the goal is to mobilize people for a social and/or political agenda within a given system. In both cases, this discourse juxtaposes the basics of Islam with Western conceptualizations of politics.

Islamic science fiction, while a limited genre, highlights protagonists who attempt to blend religious traditions with modernity. In one, Ahman Raif's *Al-bud al-khamis* (The Fifth Dimension), published in 1987, an Islamic scientist, a reporter, and a UNESCO member travel via rocket ship to Mars, where they encounter a utopian world and later converse with an American and Soviet astronaut upon their arrival. In Ali Nar's *Uzay Çiftçileri* (Space Farmers), published in 1988, a Turkish astronaut whose training combines Sufi mysticism with science discovers a new planet where he meets legendary figures from Islamic popular culture.

Since social and individual renewal overlap in Islamic utopian thinking, as in Islam in general, the glorification of the past in these science fiction novels and utopian tracts includes both spheres to describe an ideal society based on the pride of the good old days. While the place and the details of the utopia can be significantly vague, utopian social relationships are highlighted. The concept of *shura* (consultation and consensus), for instance, is frequent and prominent. This method's promotion of consensus-based leadership, consultation, and cooperation is presented as a historic Islamic response to authoritarianism. Sharia (Islamic law) is also portrayed as one of the key instruments of an Islamic model in which people can enjoy maximum equality, freedom, and social justice. These are boldly presented in these texts to assure the audience that Islam is not an impediment against democracy and development and to display the Islamic structural potential for the creation of an alternative state and administrative model.

Political Theater since 1945

Bringing together actors and audiences in a communal and interactive situation, the theater is uniquely suited as a political art form, enabling authors and directors to go beyond staging mere social interaction in order to convey a sense of the possibilities for social and political change. Its use for spreading political messages, including radical ideas, has therefore been inevitable. At the same time, to adapt the urban middle-class conventions of theatrical viewing for the purposes of a theater of political messages has always proved difficult and has resulted in innovative methods of presentation and of using theatrical technologies.

After World War II, political theater was facing a dilemma. There was no more need for antifascist propaganda, and the new adversaries in the incipient Cold War were former allies, among them the Soviet Union, whose agitprop theater had provided one of the most popular formats for political plays in the 1920s and 1930s. Political theater in the Western world had to turn to new methods and strategies. The more primitive forms of flag-waving, slogan-shouting morality plays disappeared behind the Iron Curtain; after its fall they receded to North Korea, the People's Republic of China, and other more or less totalitarian systems.

In the Western world, theater troupes and directors continued to experiment with the methods and theories introduced by Erwin Piscator (1893–1966) and Bertolt Brecht (1898–1956). Brecht's epic theater used distancing effects and its insistence on rationality to create anti-

► SAN FRANCISCO MIME TROUPE

Founded by Ronny G. Davis in 1959, the San Francisco Mime Troupe (SFMT) used the term “mime” in the classic sense of to mimic. Subverting the psychological realism and individualism of American mainstream theater of the period, the group created political satires confronting contemporary issues: the U.S. involvement in Southeast Asia and human rights. *A Minstrel Show, or Civil Rights in a Cracker Barrel* (1965) was their most successful as well as most controversial show, a mixture of vaudevillian and agitprop elements, supported by an 11-minute movie called *Oh Dem Watermelons*. It attacked the media-propagated image of the so-called happy Negro through gross comical exaggeration.

The performances of the SFMT were designed to reach beyond the hippie fringe of society. Adapting medieval stage-cart techniques for public performances in parks, court squares, or parking lots, they aimed at the nerves, the brains, and the capacities for insight of the potentially sympathetic urban middle classes. The political thrust of the SFMT is based on the assumption that in the absence of a traditional working class, the educated segments of society are the logical basis for any hegemonic shift.

In 1970 the SFMT officially became a collective. The troupe continues to tour nationwide and internationally.

—Wolfgang Hochbruck

The San Francisco Mime Troupe entertains demonstrators during a 1969 People's Park march in Berkeley, California. (Steven Clevenger/Corbis)

illusionist perspectives on the action, but the connection to political issues became less pronounced as these methods were increasingly used for aesthetic rather than ideological purposes. Many of Brecht's plays were subsequently adopted into the theatrical canon. Foremost in developing a culture of post-Brechtian political plays in Germany are Heiner Müller (1929–1995), Volker Braun (1939–), and George Tabori (1914–2007). The leaders of postwar German political theater avoided developing future-oriented visions and struggled instead with Germany's Nazi past. Turning away from the theater of Brecht resulted in many pessimistic productions. After 1968, German theaters remained strongly director dominated but now largely without the political optimism that had inspired the earlier part

of the decade. The result was a glut of manneristic productions lacking in popular appeal.

The British political stage of Harold Pinter (1930–), Arnold Wesker (1932–), and others from the 1950s onward shifted between what was called kitchen sink realism and the powerful theater of the absurd, oscillating between a stubborn hope in the changeability of social conditions and despair at the persistence of what to the authors appeared as anachronistic historical behavior and power relations.

In the United States, the psychological realism of Arthur Miller (1915–2005) initially provided a fertile basis for political plays based on the fates of representative individuals such as his character Willy Loman in *Death of a Salesman* (1949). The effects are still felt in the plays of

Sam Shepard (1943–) and others. The political conservatism of Reaganomics and the losses incurred by AIDS notably among artists and actors in the 1980s triggered a new wave of political plays. Few were as successful as Toni Kushner's (1956–) *Angels in America*, but as in Suzan-Lori Parks's (1964–) *The America Play* (1993), the political aspect is all too often lost beneath the weight of the play's formal experimentalism.

In order to avoid such restrictions and consciously counteracting the psychological play, in the 1960s and early 1970s political dissident theater groups such as the San Francisco Mime Troupe, the Bread and Puppet Theatre, the Pageant Players, and the Living Theatre (*Paradise Now*, 1968) experimented with recombinations of medieval stage formats, the symbolic action and mass chorus of agitprop, the Living Newspapers of the 1930s' Federal Theatre Project, and nineteenth-century tableaux vivants to create interactive theatrical events. The thrust as well as the accessible theatrical technologies resulted in the formation of other groups such as the ethnic Teatro Campesino, founded in the mid-1960s for the Hispanic farmworkers in California and the American Southwest.

The success of American plays ever since the early nineteenth century has been based on

their economic viability rather than their political messages, so plays aimed at economic success need to balance their political spirit and their formal innovations against the conservative tastes of the popular market. Since 2001 and in light of a political scene pressuring the cultural scene for declarations of loyalty against a background of “those who are not with us are against us,” political plays have taken on a more fundamentally dissident role again, but few theater practitioners are as capable of combining popular formats and critical politics as are political activist and actor Tim Robbins (1958–) or the Italian playwright Dario Fo (1926–). While Robbins continues the traditional form of dramatic subversion, Fo has developed a blend of satire, burlesque, and tragicomedy with clownlike overtones that won him the Noble Prize for Literature in 1997.

■ Introduction: Food

While hunger and famines are still a major problem in regions of the developing world—for example, the intermittent drought-instigated famine in the Sahel region of Africa that has lasted for decades as well as famines elsewhere in sub-Saharan Africa, South Asia, and Latin America—the decades that have followed World War II have been characterized by the mass distribution worldwide of food-stuffs once regarded as luxuries as well as of homogenized fast foods such as hamburgers that no longer closely attach themselves to a regional cuisine. Diaspora communities and the relative ease of travel and tourism have also brought cuisine to new parts of the world so that one can

buy sushi in virtually all of the world's global cities, Turkish workers have made kebabs popular in Germany, South Asians have brought Indian cuisine such as curry to England, and food such as falafel has followed Middle Eastern diaspora communities. As a result, the palate of the average person is far more sophisticated than in previous decades. Methods of freezing foods, industrial farming, genetic engineering of seeds and animals, container shipping and large distribution networks, fast food chains, and increasingly sophisticated consumers all add to increasingly globalized foodways. Concerns about the health and environmental consequences of convenience foods grown, harvested, and distributed through

networks that privilege efficiency over nutrition have also spurred current movements such as slow cooking and increased interest in organic foods and vegetarianism. While concerns over obesity surface in the developed world, as of 2009 a global economic downturn and rising costs for basic staples such as wheat and rice have led to food riots in numerous locales including Egypt and the Ivory Coast.

—*Fred Nadis*

The Spread of Frozen Foods

Frozen foods are ubiquitous in most developed societies. Entire supermarket aisles of glass-front freezers full of frozen fruits, vegetables, prepared foods, and novelties can be found. Even in the developing world, frozen foods such as ice pops are common in neighborhood shops. Early in the twentieth century, although the technology to freeze foods had been developed, the wide variety and availability of frozen foods, extending even to tropical climates, would have been difficult to conceive. Today, frozen food represents a multibillion-dollar industry, growing exponentially since the early 1940s.

Freezing is one of the oldest, safest, and most intuitive food preservation methods, at least where conditions allow. In cold climes even centuries ago, foods, especially perishable foods available in winter such as meat or fish, were frozen to preserve them for weeks or even months. Unlike other food preservation methods such as salting (as in the case of sauerkraut or salt cod), canning (as in the case of canned peas or tuna fish), or drying (as in the case of dried apricots or kelp), freezing, when done correctly, does not dramatically change the chemical, nutritional, color, flavor, or textural profile of the food. Consider, for example, the differences among a fresh beef steak, a defrosted frozen beef steak, a piece of fresh corned beef (salted), potted beef (salted and canned), and beef jerky (dried). The defrosted frozen product is closest, in fact nearly identical, to the fresh. Thus, the appeal of freezing as a food preservation method is increased by its flavor-preserving characteristic.

Frozen food as known today is extraordinarily technology-intensive. Machines are used to process, freeze, keep frozen, transport, and mer-

TV DINNERS

TV dinners are frozen entrees served on compartmentalized trays inspired by the trays used to serve airline meals. The company credited with inventing and marketing the first TV dinner was C. A. Swanson & Sons in 1954. The story of its invention, possibly apocryphal, is that the inspiration for the TV dinner came from hundreds of thousands of pounds of unsold Thanksgiving turkeys following the holiday. Regardless, the first TV dinner was indeed a meal of turkey, stuffing, gravy, sweet potatoes, and frozen peas. TV dinners, conveniently sized to fit on TV trays in order to be consumed in front of the television, were also packaged to resemble a television. TV dinners, situated in a larger context of 1950s futurism and convenience, were marketed as a time-saving convenience food, featuring long-cooking American classics such as meatloaf and fried chicken that could be heated and served in minutes. The advent of the microwave further decreased the cooking time and increased the convenience of these dinners. By 1983 they were celebrated in the song “TV Dinners” by ZZ Top in their *Eliminator* album. The song performance on MTV even included TV dinners being microwaved. Today, TV dinners are called frozen entrees or frozen segmented entrees and boast a variety of ethnic, regional, dietary, and nutritional variations.

—*Jonathan Deutsch*

chandise the food. A break in this chain from production through consumption means the total loss of the product. The logistics of getting an ice cream cone from manufacturer to consumer is much more complicated than the process for other consumer products.

The pioneer of frozen food was Brooklyn-born Clarence Birdseye (1886–1956), made famous by his experiments with freezing fish and, later, the eponymous frozen food company. While freezing food may appear to be simple—take some food and put it out in the cold—the ability to do so year-round, in a variety of climates and on demand, is more complicated. Further, while ice has been available year-round for centuries by collecting it in winter months and then shipping it to distant locations, freezing food and

keeping it frozen requires temperatures colder than ice, that is, freezing the product at temperatures around 0 degrees Fahrenheit or -18 degrees Celsius since, while water freezes at 0 degrees Celsius, many foods have freezing points below that of water. Birdseye developed his techniques while stationed in Labrador, Canada, as a U.S. government field naturalist. His eventual design featured two brine-cooled metal plates between which a piece of food such as fish could be frosted. Birdseye later founded the General Seafoods Corporation, which later merged to form General Foods.

While Birdseye's innovations in freezing food were important, especially in freezing fish for short-term transport and wholesale markets, frozen food did not become a mainstream part of the consumer diet until much later. In the 1940s and 1950s in the United States and Canada, advances in trucking, home refrigerators, and freezers made it possible not only to freeze food but also to transport it to a store, where it could be merchandised in a freezer case and then purchased by a consumer who, in the early years, would have either consumed it that same day or later and may have had a home freezer as well. Other important factors that contributed to the spread of frozen foods were the increased presence of women in the workplace during World War II; the ability to preserve food for home use without the use of tin, which was needed for the war effort; and increased interest in innovations in domestic science and technology at the time.

Today there are a few major methods of freezing food: air blast freezing with cold moving air; plate freezing, similar to the technique developed by Birdseye; and cryogenic freezing whereby foods are dipped or sprayed with liquid nitrogen.

Frozen food has several advantages. One advantage of frozen food is that it allows fragile seasonal foods such as fruits and vegetables to be available all year. In addition, because frozen food processors are often proximate to growing areas, frozen food may be higher in quality than a fresh alternative. The frozen food may have been picked, slaughtered, or caught and then processed and frozen within hours, whereas the fish, meat, fruit, or vegetables sold fresh in the supermarket may be days or even weeks old.

Frozen food is not without critics, who maintain, among other things, that freezing is an energy-intensive preservation method that is worse for the environment than eating local seasonal foods.

Globalization of Fast Food

Fast food restaurants developed in the United States during the post-World War II era when entrepreneurs such as Richard and Maurice McDonald revolutionized the food business. By applying assembly line principles to the commercial kitchen, relying on a set and limited menu, and using disposable utensils and plates, the McDonald brothers created a highly efficient food service system. Their fast food hamburger model was soon mimicked, and today the intense competition of the 1950s remains evident. Major corporations such as McDonald's, Wendy's, Jack in the Box, and Yum! Brands now compete globally for consumer palates.

Over the decades, the U.S. fast food market has grown to a \$50 billion a year industry. Globally, it accounts for over 50 percent of the fast food market, with European and Asian-Pacific markets following at about 20 percent each of the global market share. As North American and West European markets are becoming more saturated, many U.S. companies are expanding geographically, particularly in high-growth regions such as Eastern Europe and the Asian-Pacific. A recent A. C. Nielsen survey indicates that Asian-Pacific consumers now outnumber Western consumers in weekly fast food consumption. Globalization of fast food has meant not only the availability of fast food in new areas but also increased marketing in the global arena. Leading fast food companies are now affiliated with highly

visible international sporting events such as the Olympics and the FIFA World Cup.

The phenomenal growth of American companies abroad has been accompanied by social criticism. As U.S. fast food companies have expanded overseas, they often come with their own major suppliers, reducing reliance on local food producers. And despite adapting menus to local tastes—for example, Chinese Kentucky Fried Chicken offers duck soup and a fried chicken wrap resembling Peking duck—American fast food companies have been accused of threatening local cuisines and culture. There is a fear that Americans are exporting not only their fast food but also a homogenous American culture that one political theorist has described as “McWorld.” In response to this threat of cultural homogenization and the destruction of local foodways, the Slow Food movement was launched in 1989. The movement’s goal has been to counteract fast food and fast lifestyles as well as the disappearance of local food traditions. This countermovement remains strong today, with over 80,000 members around the world. Notably, the criticism directed at the globalization of fast food and the spread of McWorld is not just about fast food. Sociologists have attacked McDonaldization, that is, the spread of increased rationalization and efficiency to all arenas of social life.

Other social activists have criticized the spread of fast food on political grounds. For example, environmentalists and animal welfare advocates have criticized the industry’s widespread use of factory farming, excessive packaging, and genetically modified products along with the inhumane treatment of animals. Protests have made headlines internationally. The so-called McLibel case drew global attention when British activists were sued for libel, only partially successfully, by McDonalds for distributing leaflets that accused the company of, among other things, environmental destruction, exploitation of children through advertisements, and nutritional misinformation. In the late 1990s, antiglobalization activists also dismantled, bolt by bolt, a McDonald’s in France. Labor rights activists have also drawn international attention to alleged human rights abuses by certain fast food companies because of low wages, minimal benefits, and poor or dangerous working conditions.

➤ REGIONAL ADAPTATION OF FAST FOOD

Inside McDonald’s, everything looks familiar at first: teenagers chatting on cell phones and drinking sodas and children wolfing down fries. But the menu of this McDonald’s outlet, in the middle of India’s capital New Delhi, is a little different from the American standard. While the logo, the french fries, and the shakes look the same, the Delhi restaurant offers many options to suit the Indian palate, from smoke-flavored mayonnaise to potato-pea patties and cottage cheese wraps. In accordance with Hindu and Muslim religious and dietary beliefs, neither beef nor pork is sold. The french fries are fried in vegetable fat (without the beef flavor that has been controversial in the United States), and burgers are made of chicken or vegetables. Since many Indians are vegetarian, a range of vegetarian options is available, from the spicy potato McAlloo Tikki Burger to the Wrap Paneer Salsa, a further Indian-Mexican fusion in which Indian cottage cheese is fried, mixed with salad and salsa, and tucked into a tortilla. To top off their McDonald’s meal, carnivores and vegetarians alike can enjoy a cup of cardamom tea or a cappuccino, definitely different fare from the everyday McDonald’s lunch in the United States.

—Kimberly Dukes

Nutritionists and health advocates have also accused the fast food industry of creating a toxic environment that is contributing to an obesity epidemic around the globe. Based on definitions relying on the Body Mass Index (BMI), the World Health Organization (WHO) reports that approximately 1.6 billion adults are overweight and that at least 400 million adults are obese. The WHO attributes the spread of obesity in part to a global shift in diet toward increased intake of energy-dense foods that are high in fat and sugars but low in vitamins, minerals, and other micronutrients. The globalization of fast food—food that is often low in nutrients, vitamins, and fiber while high in fat, sodium, sugar, and calories—is considered part of the problem. Fast food companies have been somewhat receptive, now providing healthier alternatives, supplying consumers

with nutritional information, and removing trans-fats from many of their menu items.

Despite criticism, the globalization of fast food continues. Today, to give just one example, Yum! Brands, whose companies include KFC, Pizza Hut, and Taco Bell, operates over 33,000 restaurants in over 100 countries and continues to record consistent revenue increases. Future growth is also predicted, as increased global modernization and fast-paced lifestyles around the world will make fast food even more appealing.

Global Spread of Ethnic Restaurants

The spread of ethnic restaurants in modern multicultural societies throughout much of the world is a result of postwar immigration patterns, increased tourism, and globalization. These restaurants are considered ethnic since they do not represent the national cuisine of the majority population but rather that of nonnative immigrant communities. The now nearly ubiquitous presence of Mexican restaurants in the United States, Turkish kebab shops in Germany, and Indian eateries in Britain are examples of this historical change. Moreover, the process of globalization further spreads the appeal of ethnic restaurants as people along with their palates (the most obvious case being the Chinese) migrate and set up shop. By building up a local clientele of their fellow nationals, they soon attract the well-to-do national ethnic (typically white) majority craving a taste of the exotic and the foreign and the status that goes along with a sophisticated palate.

Following World War II, the need for reconstruction across much of Europe necessitated the recruitment of foreign labor, typically guest workers from abroad. Countries such as Britain, France, and Germany sought laborers from their former colonies to help rebuild their domestic economies. Indians and Pakistanis moved to Britain, Algerians moved to France, and Turks moved to West Germany, bringing along their foodways. Restaurants serving their national dishes, mostly small establishments catering to workers, rapidly emerged in small immigrant enclaves. Britain, with a longer tradition of empire, had long-established Indian eateries in major cities, with most English already familiar with Indian cuisine and a penchant for curry. France and to a greater degree West Germany also developed a taste for the cuisine of their immigrant communities. France developed Algerian, Moroccan, and Vietnamese restaurants in response to the growth of these immigrant communities. In Germany the *döner kebab* (sliced meat cooked on a vertical spit typically served in pita bread), formerly merely a Turkish staple for Turkish guest workers, is now the most popular fast-food dish among the majority German population, displacing bratwurst.

Unlike Europe, countries historically developed through immigration in the nineteenth and twentieth centuries, such as the United States, Canada, Australia, and the Latin American republics (termed “neo-Europes” by Alfred Crosby), also developed similar tastes for the non-European cuisines of their new immigrants of the postwar period. The United States had long-established Chinese and Mexican populations, and the majority population had developed an appreciation for their cuisines by the turn of the nineteenth century. However, with greater immigration from Southeast Asia, the Near East, Eastern Europe, Russia, Latin America, and Africa, the United States experienced an influx of cuisine, with more and more Americans curious to experiment on their palates. Canada and Australia, also experiencing similar developments, saw a surge in the quantity of ethnic restaurants sprouting in their major metropolitan areas. Latin America, particularly Argentina and Brazil, experiencing waves of immigration from non-European countries, also shared in this development.

In an era of increased global interaction in the form of trade, communications, immigration, and international tourism, cuisine has become a pivotal element in the process of globalization. The growth in Chinese restaurants in Argentina and Mexico, Japanese restaurants in Brazil, Korean and Indian restaurants in Japan, and Turkish kebab shops in Australia are examples of the continuity of this process. The continued immigration patterns of the late twentieth and early twenty-first centuries are characterized by the diffusion of various diaspora communities throughout much of the developed world coming from the developing world (either as guest workers, illegal immigrants, or refugees). Growing numbers of Nicaraguan restaurants in the United States, Eritrean restaurants in Britain, and Moroccan restaurants in Spain are examples of these new patterns of immigration. At the same time, globalization and market forces transcend immigration. In global cities and globalized locales that herald the postmodern collapse of spatial boundaries, foreign foods (as featured in restaurants), high-end groceries, and cooking classes are no longer rare commodities but instead are markers of sophistication and abundance.

Supermarkets

Retail chain stores such as Woolworth's and grocery chain stores such as A&P and Piggly Wiggly appeared in the United States in the early twentieth century. These new standardized outlets appeared shortly after Frederick Taylor's theories of Scientific Management had begun to transform factory production to maximize efficiency and applied similar ideas to retail and consumption, a model already pioneered in department stores and catalog houses. Open access to merchandise and self-service and an effort to minimize costs became common to early grocery and variety store chains. Even larger indepen-

➤ ETHNIC GROCERIES AND MARKETS

International immigration patterns from the developing South to the developed North have also brought immigrant diets and foods into major urban centers such as New York, London, Paris, and Berlin. A surge in the amount of small mom-and-pop grocery stores catering to ethnic minorities in much of the West has occurred since the end of World War II, mirroring such increases during prior immigration waves of the late nineteenth and early twentieth centuries. However, many large grocery store chains now carry many of these products, as they recognize the market potential of catering to the needs of the new immigrants. Furthermore, such food items are also being increasingly sought after by members of the majority ethnic populations, showing the cultural diffusion of food propagated by new patterns of international immigration and globalization.

—Abraham O. Mendoza

dent retail grocery outlets, called supermarkets, emerged in the United States in the 1930s and forged a new model that the chains slowly incorporated. It was not until the post-World War II era, however, that supermarkets became commonplace in Latin America, Europe, and, later, the Middle East and Asia. By the 1990s, food chains had become a global affair, with France's Carrefour and Holland-based Ahold creating enormous hypermarkets around the world.

In the United States in the 1930s, entrepreneurs began to open enormous grocery stores in abandoned factories and warehouses with parking for automobile shoppers. One early example was the Big Bear, which opened in 1932 in Elizabeth, New Jersey, and sold in its first three days about the same as a typical A & P store might sell in six months; another, the King Cullen chain of Long Island built stores ten times as large as the typical chain grocery stores. The new supermarkets sometimes were called "Wild Animal Stores," only partially because these stores had names such as Big Bear, Big Tiger, and Big Bull. In addition, such establishments had a reputation for being free-for-alls, with somewhat unruly customers vying aggressively for bargains. Slowly the established chain groceries adapted

➤ TRADING STAMPS

As competition among supermarkets and other outlets in the United States increased in the early 1950s, supermarket chains, drug stores, and gas stations began to offer customers trading stamps, an idea that had been around at least since the turn of the twentieth century. The stamps were to be licked and placed into booklets that, when filled, could be redeemed for items such as appliances and tools at regional redemption centers. The varieties of trading stamps offered included S & H Green, Plaid, Orange, Gold Bond, Top Value, King Korn, Valu Plus, Merchant Green, Blue Chip, Eagle, and Triple S Blue. In 1964, S & H Green Stamps listed 1,742 items available for redemption in its *Ideabook*, of which 32 million copies were distributed annually. In 1956, 52 percent of all U.S. families participated in stamp-saving programs, a figure that rose through the 1950s and 1960s. Since the stamps added to retail costs (by 1968, retailers were paying \$11 billion annually to stamp companies) and were nearly universally adopted, the competitive edge that they provided retailers was slowly blunted, making the chains somewhat grudging participants.

At the same time, retailers in countries such as Great Britain and Japan were also offering trading

stamps. The Komatsu department store in Tokyo offered its first trading stamps in 1954, and several other stamp programs developed in the late 1950s and early 1960s including Blue Chip, Green Stamp, Golden Stamp, and Zeshoren. In the 1970s, retailers and gas stations began to migrate away from trading stamps to lower prices and/or other promotions. By the late 1980s only three diminished trading stamp companies were left in the United States: Sperry and Hutchinson (S & H), Quality Stamp, and Gold Bond.

But with the growth of frequent shopping cards and Internet sales in recent decades, the trading stamp is back, in virtual form. Airline bonus miles programs are a variant on trading stamps, while S & H has shifted from green stamps to green-points, with many major retail chains offering green points for online sales. Gold Bond also offers gold points programs. Perhaps even more significantly, supermarket chains now routinely offer club cards to shoppers that provide discounts. Unlike trading stamps, these become a new source of profits to supermarkets, which sell shopping data to advertisers. This information can also be subpoenaed by governments, leading to graver concerns about privacy.

—Fred Nadis

to offer the price advantages of these mass markets with a focus on quality and efforts to respond to what women shoppers looked for in such establishments. Forty percent of all U.S. groceries were purchased in such self-service stores by 1940, 60 percent by 1947, and 95 percent by 1958. *Life* magazine's cover showing an upscale woman pushing a shopping cart through a supermarket for a 1955 issue indicated a new acceptance of the supermarket.

One force behind the internationalization of U.S. business methods was the Marshall Plan's technical assistance programs to end shortages that provided \$300 million in funding between 1945 and 1960 to aid European industry and commerce. At the same time, private companies in Great Britain tested public interest in Americanized shopping. For example, in September 1948, Hussman British Refrigeration Ltd. mounted

a full-size model supermarket at the Imperial Institute of London; the model later toured to other cities in England and Scotland. By 1953, British capital entirely backed the first large self-service groceries in London, its plans based on studies of American supermarkets.

Another nongovernmental force was Nelson A. Rockefeller's International Basic Economy Corporation (IBEC), which combined a for-profit motive to investors with the progressive ideal of spreading economic progress in the postwar world. IBEC brought supermarkets to Venezuela in the early 1950s, and in 1956 IBEC decided that Italy was the best European target country for U.S.-styled supermarkets, with an initial plan of opening three stores in Milan. IBEC found Italian partners to finance 49 percent of their operations. As they opened their Supermarkets Italiani S.p.A. outlets, first in Milan and later in Florence,

the management learned to change the U.S. model, offering not only durable canned goods, frozen foods, and brand names but also fresh foods such as pasta and bread. As in the United States, promotions such as free gifts were given to customers, and a daily lottery was offered. Because of boycott threats and resistance from small shop owners, Italian wholesalers refused to sell to Supermarkets Italiani S.p.A., so it instead imported directly from foreign sources and began to create its own production units to create pasta, bread, ice cream, coffee, and other goods. Despite boycotts, strikes, delayed licensing, stink bombs, fistfights, and in-store demonstrations, the IBEC supermarket model held for Milan and later in Florence, gaining substantial profits. Customers were fascinated with the new stores and what they represented and wrote glowing notes to management about America and Rockefeller.

As this American model of mass consumption developed and began to take hold abroad, large multinational companies based outside the United States became global leaders. The French company Carrefour, the world's second-largest retailer following Wal-Mart, opened its first hypermarché in 1963 in Sainte-Genevieve-des-Bois outside Paris, creating an enormous retail outlet that combined a grocery supermarket with electronics and other retail goods. In the decades that followed, Carrefour continued to expand into other countries in Europe, the Middle East, Latin America, and Asia. After a brief foray in the U.S. market in the 1990s, Carrefour withdrew from direct competition with Wal-Mart but continued to hold stakes in U.S.-based big box retailers such as Office Depot and Pet Smart.

Organic Foods Movement and Vegetarianism

During the twentieth century, the organic foods movement and vegetarianism moved from the fringe toward the mainstream of popular culture as part of a growing public concern with the environment and personal health. For participants, these movements may constitute part of a complex of ethical commitments to the local and global environments. At the same time, these interlinked lifestyle choices emphasize personal health benefits for the individual, the family, or society and suggest the growing importance of a green business model to consumers.

While restrictions and definitions vary between countries, in general organic food production focuses on maintaining ecological balance in farming, and organic farmers avoid the use of synthetic fertilizers and pesticides, hormones, or genetically modified organisms (GMOs). The organic foods movement stems from many origins but was influenced by the work of Rudolf Steiner in the 1910s and Sir Albert Howard, Lady Eve Balfour, and Hans Peter Rusch in the 1940s.

Vegetarians follow a diet that eschews meat and sometimes all animal products. Some want to prevent killing or mistreatment of animals; others choose the diet for health reasons or assert that a plant-based diet can help resolve the global food shortage. While vegetarianism has long been practiced for health, religious, or philosophical reasons, during the nineteenth century some Western Christian groups began to link vegetarianism with natural food and a responsibility toward animals, while more secular groups connected it with a return to higher moral or ethical standards.

During the twentieth century, vegetarianism became associated with other movements that often mistrusted modernity or technology and for some time were perceived as fringe movements. These included the back-to-the-land movement, early environmentalism, alternative medicine, and, alongside the broader health food or natural food movement, sustainable and organic agriculture. In the early twentieth century in the United

➤ GENETICALLY MODIFIED FOOD DEBATES

In the past decade, organic farmers and consumers have created new alliances around health issues, particularly the concern in Europe, New Zealand, North America, and Asia about the possible risks of genetically modified organisms (GMOs). Organic advocates worldwide, from Canada to Thailand and India, have objected to their governments' interest in producing or importing GMOs. In 1998, American and European organic supporters opposed the development of new U.S. Department of Agriculture regulations that they viewed as insufficiently strict. Since the late 1990s, European organic farmers and consumers have protested repeatedly against GMO field trials that risked the organic certification of neighboring farms, and they currently dispute proposed changes to European Union (EU) organic farming laws that change labeling practices and allow some GMO contamination. A successful appeal against European Union restrictions on GMOs, brought at the World Trade Organization by the United States, Canada, and Argentina, among others, led to protests in Europe and North America.

—Kimberly Dukes

States, Bernarr McFadden promoted vegetarianism and health food as boosting masculinity, fertility, and muscles; some of his ideas influenced students such as J. I. Rodale, whose magazine *Organic Farming and Gardening* helped popularize the organic foods movement during the 1950s. In the 1960s and 1970s, both organic foods and vegetarianism became associated with the counterculture in the West, hippiedom, Eastern spirituality and yoga, and a larger context of social justice and environmental advocacy.

A growing consumer interest in individual and global wellness toward the end of the twentieth century helped change the public perception of these movements. In the 1970s, the

mounting public concern with health and diet coincided with the preoccupations of nutritional science, leading to a growing appreciation of the nutritional value of a more vegetarian diet and of health food in general. The public also questioned the widespread use of pesticides in farming, leading to greater interest in organic foods. During the 1980s, organic foods moved out of the counterculture and became increasingly associated with elite tastes and high prices.

Since the mid-1990s especially, both the organic foods movement and vegetarianism have grown ever more mainstream, with their benefits showcased in popular menus, magazines, and cookbooks. Internationally, organic foods capture an increasingly larger market share, especially in the United States, Western Europe, and Japan. Particularly since 2000, organic foods have become big business for major companies such as Wal-Mart, Tesco, and General Mills, and greater acreage worldwide is reported as under organic production. This has led to increased availability and lower prices for organic foods but is accompanied by questions about the processes used in producing this food.

While organic foods movement and vegetarianism have become more mainstream, they often remain associated with a larger complex of ethical, social, environmental, and economic choices. Other associated international food movements include the Slow Food movement, the Community Supported Agriculture movement, and the local foods movement.

Migration and Travel

Since 1945, both tourism and migration have intensified as accompaniments to and key ingredients of globalization. Growing wealth and improved infrastructure have encouraged tourism. At the same time, growing world population, political disruption, and economic opportunities have spurred both legal and illegal migration for refugees and workers. By the year 2000, more than 150 million people lived in countries foreign to their birth nations, with about 10 percent of these refugees. In that same year, as many as half a billion tourists would travel to foreign destinations worldwide. These trends, with their unintended consequences and attendant debates, reveal the post-World War II era as one of major social disruptions, economic promise, and paradox.

Political migrants, or refugees from war or oppression, reflect the enormous political and social upheavals experienced since World War II. Roughly 95 percent of the world's refugees in this period are from Third World countries, with the majority of those displaced from sub-Saharan Africa. Grappling with the refugee crisis engendered by World War II, particularly that of displaced persons (DPs), in 1947, the United Nations (UN) framed its Universal Declaration of Human Rights, which, among other principles, asserted refugees' right to asylum. In 1951 the UN High Commission for Refugees was established. One of the first major crises that it faced was the roughly 3.5 million Palestinians displaced after the Arab nations' war against Israel in 1948–1949. In the 1960s, decolonization and attendant ills saw the emergence of a refugee crisis throughout Africa. The 1970s and 1980s reflected further refugee crises as Vietnamese, Cambodians, and Laotians fled in the tangled aftermath of U.S. involvement in Vietnam. In this same period many refugees from the wars in the Central American countries of Nicaragua, El Salvador, Honduras, and Guatemala made their way to Mexico. More recent disruptions in the 1990s and early 2000s have spurred refugee crises in Haiti, Eastern Europe, and various African nations, one of the worst of these conflicts displacing as many as 7 million Sudanese.

Beginning in the 1950s and more especially in the 1960s, Western nations, responding to UN humanitarian demands and the moral imperatives of the civil rights movement and anticolonial discourse, began to liberalize immigration policies, opening their borders to unskilled and skilled labor. In the 1950s and 1960s, many Turkish men, subsequently

Political migrants, or refugees from war or oppression, reflect the enormous political and social upheavals experienced since World War II. Roughly 95 percent of the world's refugees in this period are from Third World countries, with the majority of those displaced from sub-Saharan Africa.

followed by their families, were allowed into West Germany as guest workers; Great Britain also permitted immigrants from former colonies and commonwealth nations (such as Jamaica, Haiti, and Pakistan), while France accepted immigrants from Algeria and other former colonial possessions. In the United States, the Immigration and Nationality Act of 1965 removed racial quotas that had been in place since the 1920s. In the 30-year period that followed, more than 30 million immigrants were admitted to the United States. Similar immigration policy shifts have increased the international populations of Australia and New Zealand.

From the oil crisis of 1973 on into the twenty-first century, there has been intense debate about the trend to transnational migration and its impact on nation-states and national identity. On the Right, political parties such as Jean-Marie Le Pen's National Front gained prominence in France by promoting a racist, xenophobic, anti-immigration agenda. Yet even scholars with liberal views, such as Arthur Schlesinger and the more controversial Samuel Huntington, have argued that recent immigration has not led to assimilation and instead threatens the unity of nation-states dependent on cultural rather than civic nationalism.

Immigration policy has shifted in accordance with these concerns. In recent decades, public resistance to refugees seeking asylum have made countries such as Australia and Germany restrict the entrance

of asylum seekers to microscopic quotas. Such positions, particularly in the United States, have hardened, along with border controls, following the September 11, 2001, attacks on U.S. soil. Centuries-old debates about the relative values of assimilation or of maintaining ethnic identity in adopted lands show no sign of fading; this is especially evident in Europe, squeezed between an aging indigenous population and a burgeoning immigrant birthrate.

The sample artifacts sold as souvenirs may have been manufactured thousands of miles away. Locals, particularly those catering to the tourist industry, likewise perform a version of the authentic, turning daily lives into theme park exhibitions.

In this same period, growing wealth in Western nations had made tourism the world's leading industry. While foreign travel once had been a luxury only for the very wealthy, developing transportation and communication networks helped usher in an age of mass tourism since 1945. In 2000, more than 11 percent of gross global product came from tourism, while more than 13 percent of the world's workers were employed in the industry. With more than half a billion international tourists yearly, tourism is a major component of global consumer culture that provides a widening middle class access to luxury goods and lifestyles.

Paradox accompanies mass tourism. While other consumers might remain at home to work and during their leisure hours watch on television the simulacra of exotic locales or visit a nearby theme park for an imaginary international tour, travelers attempt to experience something distant and new. Yet travel destinations tend to be so commodified and the travel experience so packaged that tourists—perhaps in search of the exotic—may experience only a bland version of the place they have labored so hard to uncover. In this sense consumer culture on all fronts encourages what many commentators have referred to as a “loss of

place.” The sample artifacts sold as souvenirs may have been manufactured thousands of miles away. Locals, particularly those catering to the tourist industry, likewise perform a version of the authentic, turning daily lives into theme park exhibitions.

The politics of tourism also replicates the colonial experience, as presumably wealthy outsiders no longer seek to strip the land outright but rather to admire and play on primitive land while others provide them with luxury services. Local resentment over such quasi-foreign occupation may build. Likewise, the environmental impact of tourism, even ecotourism, can be severe. Popularity brings the attention of global capital, increasing the development of once pristine landscapes; luxury hotels, swimming pools, and golf courses drain water; guests generate waste, rent cars, and add to air pollution; and fragile ecosystems deteriorate from overuse. While tourism provides new wealth and infrastructure improvements to what may be impoverished countries or regions, the average person’s poverty is often barely abated with low-paying service jobs; in many regions, tourism has become the twenty-first-century cash crop. If tourism offers a devil’s bargain to all, few outside the world’s dwindling number of communist command economies refuse to pay the price.

■ Introduction: Transportation and Trade

Since antiquity, goods, human travelers, and armies moved along the roads and sea-lanes of the world. The Roman roads, the Grand Trunk Road in India, and the Silk Roads were, along with sea routes, used by merchants more than by armies. The world since 1945 has experienced enormous population growth that has been supported by huge increases in global trade. The huge volumes of trade could only have been exchanged because of vast changes in global logistics.

The modern era’s development of a global economy has been supported by an international financial system. Today that system can electronically transfer money virtually anywhere. However, bulk resources, commodities, goods, and people still have to be carried physically. The transportation of bulk commodities such as oil has been the product of several factors. One of the most important of these is the advances in shipbuilding. Oil tankers were engineered into giant supertankers. The invention of the cargo

container unit made trade more efficient and cost effective.

Cargo container ships now carry huge volumes of goods for delivery around the world. They are efficiently loaded and unloaded. The cargo containers, once landed, are put on trucks or trains for delivery to their ultimate destinations. The whole system has been engineered for international deliveries, making the global economy the largest and most efficient in the history of the world. Trucks, trains, planes, and barges have increasingly competed with each other for the cargo shipping business, but because of the growing volume of trade, none has replaced the other. They have all only grown larger.

The growth of automobiles has freed people to travel on land long distances at low costs. A huge service industry consisting of gasoline stations, selling diesel and other fuels, along with housing and food has replaced the old caravan-serai system of inns. The transportation of people on land in automobiles has been matched by

global air travel. After the 1960s airplanes very nearly caused ocean liners to vanish from the seas. With travel relatively cheap and with the rise of global prosperity, pleasure cruise ships grew into an industry of floating pleasure palaces. Cruise ships carried vacationers on adventures with little beyond romance and fun as the goal of the journey, all supported by a logistics system that allows travelers to see places only heard about or dreamed of by earlier generations.

—*Jack Waskey*

Cargo Container Shipping

In the 1950s a system of containerization developed to permit the handling of freight regardless of whether the freight is being hauled by trucks, trains, or ships. The system is an intermodal system put in place using standards set by the International Organization for Standards (ISO). The development of ISO standards for cargo containers is one of the great advances in logistics in the twentieth century. The container revolution is a key component of global trade.

The containerization enables the handling of cargo in ports using a standardized container. The standardization allows great savings in the cost of handling cargo, as it reduces the amount of labor needed, speeds handling, reduces business costs, and also results in lower transportation costs subtracted from the cost of goods to consumers. The lost jobs, formerly performed by unskilled or semiskilled freight handlers, have been converted into higher-paying jobs for the

mechanized container handlers. Nevertheless, container shipping was economically devastating to dock workers and freight handlers.

The first container freight systems emerged in the 1920s. American railroad carriers that were handling the mass shipping of automobiles responded with the development of standardized shipping rail cars. At the same time the Seatrains Lines began shipping loaded boxcars on ships. However, the practice was limited. After 1945 the railroads developed the piggyback service, which allows the freight trailers of 18-wheel transfer trucks to be loaded onto flatbed railroad cars and then moved across the United States. The practice spread about the time that the U.S. Department of Defense established a standardized military shipping container. The standard was adopted by Great Britain. The use of a standardized container soon ended the use of the old wooden box and barrel containers.

Containerization next began to develop in ships. In order to handle standardized containers, new ships were built. The first was the *Clifford J. Rodgers*. It was built in 1955 in Montreal and sailed a route between Vancouver, British Columbia, and Skagway, Alaska. When the ship arrived in Skagway its standardized containers were loaded onto railroad cars that had been purposely built for the containers. On the return voyage the *Rodgers* would carry containers filled with goods or materials brought from the Yukon or Alaska to Skagway by rail, truck, or smaller ships.

Statistics indicate how this revolution in transport increased trade while devastating labor: in 1959, each dockworker unloaded .627 tons per hour; in 1976, with increased standardization and mechanization, the amount increased to 4,234 tons per man hour of unloaded freight. Far fewer workers were needed to handle far higher volume. Recognizing the inevitable, in one labor agreement in 1961 the International Longshore and Warehouse Union agreed that workers would accept the new methods and inevitable layoffs in exchange for large donations to retirement funds and workers' benefits.

Between 1960 and 1980 a variety of different containers came into use. The different-sized containers were not compatible for tight packing in the holds of ships. Space was lost, and cargo

Cargo container ship entering the harbor at Charleston, South Carolina, 2008. (Andrew J. Waskey)

could shift during rough seas, causing damage. With dozens of incompatible containers systems, the containers were difficult to handle both inside of the United States and on Europe's railway system. In response the ISO was created to set standards in terminology, container specifications, and a system for effecting changes when needed. In addition to new designs in ships, the new containers were loaded double-stacked on trains, increasing freight capacities.

Within the United States, the new standards to be adopted were curtailed by the Interstate Commerce Commission due to its historic mandate that argued that standardization reduced competition. However, the movement for standards won the day by the 1990s. By 2007 nearly all of the world's nonbulk cargo was being shipped on container ships. A quarter of them start their journey from China. There were 20 million containers making about ten trips per year back and forth across continents and oceans.

Supertankers

The bulk transportation of oil in ships is the work of oil tankers (petroleum tankers). Since 1945 the size of oil tankers has increased dramatically, enabling very large oil cargos to be sent from remote places where oil originates to markets around the world. Today they are a fifth of the world's cargo ships, and without them many

ISO

ISO stands for the International Organization for Standards. Its Central Secretariat is located in Geneva, Switzerland, and coordinates the system. There are currently nearly 160 countries that belong to the ISO. The ISO is a nongovernmental organization (NGO) formed into a network of the standards institutes of its member countries. Each country has one standards institute that belongs to the ISO. Because some standards institutes in some countries are private organizations and are public agencies in others, the ISO is a hybrid organization of public-private participation.

The ISO provides a mechanism for business and governmental organizations to meet the needs of the stakeholders in business, government, and consumer groups. It has developed more than 16,000 standards in areas such as food safety, medical implants, shipping containers, management procedures, financial reviews, and electronic parts. It is currently issuing more than 1,200 additional new standards every year. The work of the ISO makes it possible for goods to be sold around the world as interchangeable parts or products made to globally known standards.

—Jack Waskey

places could not be supplied with oil because there are no pipelines reaching many areas of the world.

The 500,000 supertankers carrying oil supplies (as of 2008) have developed from the tankers that were in use in 1945 that were called T-2 tankers. They had been built by the hundreds during World War II and were to remain in use for decades afterward, until political instability and costs drove the oil companies to seek the construction of supertankers.

Crude oil tankers carry crude oil to refineries, while product tankers carry the products of refineries to industrial sites. Product tankers are usually smaller than crude tankers. The T-2 tankers produced during World War II and afterward had a deadweight tonnage (DWT) of 16,800 tons. They carried 141,000 barrels of oil. With a length of 523.6 feet (159.59 meters) and a displacement weight of 21,800 tons, they could readily sail through the world's primary navigational choke

➤ FLAGS OF CONVENIENCE

To maintain its official neutrality, the United States prior to its entry into World War II created the idea of the Panamanian ship registry. Legally, a ship with a Panamanian flag was a neutral ship that could carry goods to Britain through the German U-boat blockade without involving America directly. About the same time American oil companies created the Liberian Registry. The company that owned the ship was based in New York, but the ship was technically Liberian.

The flying of flags of convenience was found by the shipping companies to be very profitable. A ship registered in a Third World country could hire its crews from impoverished nations at low-cost wage rates and did not need to follow stricter, more costly European or American safety and labor laws.

The traditional shipping industry centered in Western Europe and the United States has relied on a series of informal gentlemen's agreements setting the rules for shipping. In the 1980s the Third World nations recognized the possibility that fees and other incomes could be derived from providing flags of convenience. The whole system exploded, with the Third World competing to provide the cheapest flag.

The competition has led to economic efficiencies but has also created fleets of dangerous ships and tankers that threaten the environment. An international organization that seeks to set standards for the safety of ships at sea is the London-based International Maritime Organization (IMO), a specialized United Nations agency. The IMO is supposed to set rules, but as long as these can be skirted ships will continue to sink, with oil spills as one consequence.

—Jack Waskey

points, the Suez and Panama canals. They could also berth in the world's main harbors.

The T-2 tankers were the successor to the earlier oceanic oil transports beginning with the brig *Elizabeth Watts* (224 tons) that sailed in November 1861 from Philadelphia to London. The British, Norwegians, Swedes, and others advanced the design of oil tankers, meeting many challenges in developing naval architecture. The same types of challenges to shipbuilding had to

be met with the development of supertankers to replace the T-2 tankers beginning with the Suez Canal crisis in 1956, which kept the canal closed for months and forced tankers from the Middle East oil fields to sail around Africa in order to deliver oil supplies to Europe.

In 1959 Aristotle Onassis, a Greek shipping magnate, rebuilt two of his fleet's tankers, the *Olympic Runner* and the *Olympic Rider*. Originally 48,112 DWT, after a conversion cost of over \$1 billion they were 58,900 DWT. They sailed for many years after, profitably, at a lower cost per nautical mile.

By the 1970s the OPEC oil embargo of the United States and the rising cost of shipping oil forced oil companies to build ever larger tanker fleets. Very large crude carriers (VLCC) with a DWT of 250,000 or more were built from the mid-1950s to the 1970s. VLCC tankers were followed by the construction of ultra-large crude carriers (ULCC) of 500,000 DWT or more. While the cost of a VLCC and ULCC supertanker is high and these supertankers require longer routes to avoid canals, significant savings in operating costs were gained because it would take 15 or 30 T-2 size tankers to transport as much as 1 supertanker with added crew expenses.

Oil spills were a hazard that was globally accepted for decades because it was assumed that the oceans had an infinite capacity to absorb human-generated waste. However, with the 1967 damage caused by the sinking of the tanker *Torrey Canyon*, attitudes began to change. After the famous *Exxon Valdez* oil spill (1989), environmentalists pushed for improved safety. The U.S. Oil Pollution Act of 1990 holds companies shipping oil to the United States liable for cleanup; in recent decades, many fleets have shifted to double hull designs to reduce the likelihood of serious oil spills.

Airline Industry

Tremendous developments have occurred since 1945 in the field of aviation. Designers have introduced new varieties of military and commercial aircraft that offer an increase in speed as well as in carrying capacity for freight, passengers, or payload. The growth of the airline industry in the post-World War II era brought enormous opportunities for travel, immigration, and business as well as new threats, including the global spread of disease and terrorism. Since 1945 the airline industry went from being dominated by national governments to an open-skies global industry, with national airlines competing and cooperating around the world.

Factors that aided the growth of the airline industry following World War II included a surplus of military planes, such as the American-made twin-propeller DC-3 cargo plane, as well as thousands of former military pilots available to fly all manner of planes and an aircraft manufacturing industry that could convert to the production of civilian planes.

As governments realized the economic benefits of international airports, they usually subsidized the airports in their major cities in order to gain the jobs that air travel and air cargo generated. This led to the building of a growing number of airports. By the 1960s, the modernist architecture associated with airports—for example, Eero Saarinen's TWA terminal building at John F. Kennedy International Airport in New York City—as well as advertising conveyed air travel as glamorous and modern.

In the 1960s new jet aircraft were built to carry large numbers of passengers on transcontinental or transoceanic flights. These models had pressurized cabins that enabled long flights at greater speeds and altitudes with greater payloads. Among the new planes were the American Douglas DC-6, the Lockheed Constellation, and the Boeing Stratocruiser. In Europe the Airbus company, a joint venture of French, British, and other European interests, began its plane manufacturing as well. Other European companies that have been organized include EADS, BAE Systems, Thales, Dassault, Saab, and Finmeccanica. New airplane manufacturers in Europe were able to capture half of the global air travel business by

2009. In Asia, Hindustan Aeronautics Limited has emerged.

With the new subsonic jet passenger planes and the low oil prices of the 1960s, the airline industry boomed. Millions of passengers were able for the first time to afford to fly from the United States to Europe. Numerous transatlantic ocean liners were put out of business as a result. In the following decades, new planes continued to be introduced such as the European Concorde and the European Airbus and the U.S. built DC-10, Boeing 747, and Lockheed L-1011 jumbo jet. These new aircraft were profitable because of their greater range and carrying capacity.

In many countries the national airline is owned by the government and is subsidized. As of 2009, Emirate Airlines was controlled by the ruler of Dubai, Sheikh Ahmed bin Saeed Al-Maktoum. Jordanian Airlines began as a private company but was eventually bought out by the Jordanian government. All during the Cold War, the Soviet airline service was state owned. However, in the United States, the airlines are privately owned and face enormous competition both domestically and internationally. In 1978, the United States deregulated the airline industry. Dozens of new airline companies entered the deregulated industry, leading to less-expensive tickets and an increase in passengers. However, most eventually went out of business or were merged with larger airlines.

Some of the original U.S. airline companies such as Trans World Airlines (TWA), Eastern, and Pan American disappeared. Others such as Continental (1983 and later 1990) and Delta (September 2005) went into bankruptcy, from which they were able to emerge as potentially viable companies. Even low-cost no-frills airlines were facing bankruptcy. By 2008 airline industry stock had changed from a good investment in the 1960s to one that most small investors sought to avoid. A major problem has been the continually rising cost of aviation fuel.

Concerns in the new millennium about the airline industry are numerous. Public health authorities are developing strategies to cope with the possible spread of infectious agents by international air travelers. Environmental critics of the airline industry have linked the industry to global warming. The European Union (EU) has

implemented a plan requiring all EU nation airlines by 2012 to purchase and trade carbon credits to offset emissions from flights. Airlines based in numerous other countries that fly into Europe that are also expected to participate have not yet agreed.

The Global Automobile Industry, Post-1945

While historian James J. Flink described the automobile as a “progressive” historic force that improved lives through the mid-twentieth century, in recent decades concerns about traffic fatalities, pollution, unfair labor practices, the

energy crisis, and global warming all have repainted the automobile industry as a necessary evil at best and as a panderer to consumer narcissism at worst. Nevertheless, the automobile industry remains one of the world’s key industries, with governments often tracking its health as a key indicator of economic vibrancy. From 1950 to 2005, the number of passenger cars produced each year rose from 8 million to 46 million worldwide. That number is expected to grow as markets expand in Eastern Europe, India, and China. While production has increased, the number of automobile companies has fallen steadily as start-ups vanish and national and transnational giants merge, acquire, and consolidate. At the same time, the industry is overcapacity in its production abilities, and many of the giant corporations make as much from their financial services to customers as from production and sales.

While the consolidation of the automobile industry first began on the national level, by the 1960s the entry of foreign cars into domestic markets led to further international consolidation. For example, the number of British car manufacturers decreased from 200 in 1913 to about 30 following World War II and by 1968 consolidated into only one corporate giant, British Leyland. Much of that holding company was eventually purchased by Honda and BMW. In the United States a scenario similar to that of Britain unfolded. From hundreds of start-ups in the early twentieth century, there were only three major automobile conglomerates by the 1960s: General Motors, Ford, and Chrysler. In 1998 the ailing Chrysler motors merged with Daimler (Mercedes-Benz), one of the giant German firms along with BMW and Volkswagen. Daimler-Chrysler went on to acquire portions of Japan’s Mitsubishi and South Korea’s Hyundai, while Hyundai in turn had large stakes in Kia. In the same period Volkswagen also made numerous acquisitions, including Skoda (Czechoslovakia), Rolls Royce, Bentley, Lamborghini, Bugatti, the Spanish SEAT, and a large share of Audi. The only major automobile manufacturers that did not undergo mergers in this period were Honda, Toyota, and Peugeot, yet all of them engage in joint ventures with various manufacturers.

Along with this scenario of consolidation, the rise of the Japanese automobile industry has

► ROBOTS IN AUTOMOBILE FACTORIES, 2005

Starting in the 1970s, robot labor began to saturate the automobile industry in Japan. After the decade’s oil shocks and economic recession, European and U.S. car manufacturers took a lesson from Japan and began to displace blue-collar workers with “steel-collar” labor. According to the International Federation of Robotics publication “Key Data 2005,” the density of robots/human workers in the world automotive industry in 2005 was approximately 1 robot for every 10 human workers. The specific country-by-country breakdown is as follows:

Japan—17.1 robots per 100 human workers
 Italy—16 robots per 100 human workers
 Germany—11.8 robots per 100 human workers
 France—11.2 robots per 100 human workers
 Spain—9.5 robots per 100 human workers
 United States—7.7 robots per 100 human workers
 United Kingdom—6.1 robots per 100 human workers
 Sweden—6.3 robots per 100 human workers

—Fred Nadis

been a key development since 1945. Prior to the war, Ford and General Motors assembled vehicles for the Japanese markets but were excluded as of 1936. In the late 1940s, Japan's automobile companies were producing about 20,000 units yearly, primarily small trucks. By the late 1960s Nissan and Toyota had begun to export light trucks. By 1991 Japan's output of cars and small trucks had increased to 13 million, making it the world's largest manufacturer. Following the 1970s oil shocks, both U.S. and European firms retooled their manufacturing processes to mimic the Japanese. The Japanese concerns with fuel efficiency and decreasing pollution emissions also meshed well with the new realities of oil scarcity and environmental priorities. New management methods that enforced a leaner approach to production, including cost accounting in decision making as well as six-day workweeks, little genuine union oversight, and rules that allowed workers to perform multiple tasks also aided output. Assembly line robots were another dramatic aspect of Japanese manufacture. First introduced in the late 1960s, by 1987 approximately 116,000 industrial robots operated in Japan, with 40 percent in the automobile industry.

The transnational corporations that now make up the globalized automobile industry operate plants in multiple nations, often purchase outsourced parts and systems from the same manufacturers, engage in joint ventures that involve pooling resources, rely heavily on robot labor, and often within their large family of automobile brands have developed modules (for example, of dashboard assemblies) and limited vehicle platforms that make the different brand names they manufacture, often on the same assembly lines, nearly indistinguishable. Many reviewers, for example, decry that Ford's purchase of the upscale Jaguar has made its Jaguar X-Type largely indistinguishable from the Ford Mondeo. At the same time, while 10 percent of the workforce in many countries is directly employed in automobile manufacture, labor unions struggle to negotiate effectively with transnational companies with shifting manufacturing and financial bases. The global economic turndown that began in 2007 radically affected the automobile industry, with U.S. giants such as Ford and General Motors both going into bankruptcy and Toyota

in 2009 reporting losses and factory cutbacks for the first time in recent decades.

Global Trucking—The Sources of Differing Industry Characteristics

Trucking is the lifeline of industry and is crucial to consumer societies. Whether as the sole means or integrated into larger transport networks via container shipping, trucks carry virtually all the raw materials and finished products of industry. There are, however, significant differences in trucking industry characteristics from country to country resulting from differences in geography, legal restrictions, and taxation.

Up until the mid-twentieth century, trains dominated freight transportation. The inability of trucks to handle heavy loads and the lack of highways limited the usefulness of trucking to short hauls within cities. The ability of trucks to carry larger and larger loads and the steady building of better roads allowed trucks to be viable competitors. In the United States, President Dwight Eisenhower's signing of the Interstate Highway Act of 1953 authorized the construction of 44,000 miles of a new national megahighway. The dominance of rail freight transportation appeared to be coming to an end. In the United States, the trucking industry continued to grow rapidly as it offered inherent flexibility over rails, relatively low start-up costs, minimal operation skills, and capitalized on government-built highways and minimal regulation.

Railroad companies argued that trucking competition was unfair because trucks used public roads while railroads had to own and pay taxes on all railroad property. Even as the fuel tax paid by truckers increased, it was collected only to cover any extra costs necessary to allow the roads to accommodate ever larger trucks.

Trucking and railroads were both regulated in the United States until Congress passed the Staggers Rail Act and the Motor Carrier Acts of 1980. Thousands of new smaller carriers entered the industry as a result of deregulation. This resulted in declining rates and the failure of many of the larger trucking companies.

The Motor Vehicle Transportation Act of 1987 increased transborder trucking between the United States and its northern neighbor, Canada. According to the American Trucking Association, in 2004 about \$35 billion in freight was shipped by truck in each direction between Canada and the United States. The North American Free Trade Agreement (NAFTA) further dismantled entry barriers between the United States, Mexico, and Canada, thereby increasing transborder trucking throughout North America.

The European trucking industry differs dramatically from that of the United States. The United States has significantly looser labor restrictions and tax laws and less government support of rail service. Although this would suggest that European countries would rely less on trucking compared to the United States, this is not the case. There are three times as many trucks per person in Europe as there are in the United States, and traffic is typically made up of twice the number of trucks on the road in Europe compared to the United States. In addition, the trucking companies in the United States tend to be larger than in Europe, and the numbers of drivers who operate their own trucks are fewer than in Europe. For example, in 1997 the U.S. trucking companies employed almost 15 people on average, whereas in Europe the average number of employees was about 3 per company. The number of drivers who own and operate their own trucks is around 25 percent in the United States but 70 percent in Europe.

Prior to the formation of the European Union in 1999, trucking in Europe was hindered by haulers needing to abide by the many bilateral agreements that existed between each country. The formation of the European Union has allowed countries to largely dismantle these agreements and will effectively liberalize the markets. For the countries not part of the European Union, the requirements of these bilateral agreements remain a significant barrier to trade.

Although in industrialized countries throughout the world the trucking industry is vibrant and growing, in many of the less-developed countries of Africa, Asia, and Latin America truckers face dangerous roads and bridges and other infrastructure problems. They must make frequent stops at checkpoints or roadblocks and take long detours, which extend deliveries by days. In addition, local officials, militia, and police often harass drivers by demanding inspections, documentation, and bribes. In war-torn countries such as Uganda, Darfur, and Iraq, truckers play important roles beyond commercial interests by providing military and medical support while often becoming the target of enemy fire.

The Modern Silk Roads

The Silk Roads, the fabled network of overland tradeways that led from China across Central Asia to the West, came to a virtual close by around 1500 with the collapse of the Mongol empire and the Muslim Timurid dynasty. Over the following centuries, dominance in Central Asia and West Asia varied among new power centers. From 1945 to 1991, the Cold War confirmed a bipolar division of the Silk Roads region between a central portion incorporated in the Soviet Union and a western portion under French, British, and U.S. influence, with separate yet similar initiatives in the areas of modernization, state building, economic development, and energy exploitation. In the 1970s, this precarious equilibrium was shattered. The West lost control of the exploitation and transportation of oil when the Middle East affirmed its power through the formation of the

Organization of Petroleum Exporting Countries (OPEC) in 1973. In 1979, the strengthening of traditional Islamic groups that were rejecting communist influence in Central Asia caused the Soviet Union to invade Afghanistan.

In 1991, the breakup of the Soviet Union made possible the first significant reopening of Silk Roads trade since 1500. The European Union immediately offered help to Central Asian nations in the areas of road, rail, and fiber-optic transportation; nation-building; internal economic development; and trade assistance. The United States joined in the development of new oil and gas pipeline networks from the Caspian Sea toward Turkey and Europe. Russia salvaged its energy ties with the now independent Central Asian Republics and modernized its north-south umbrella-shaped energy transportation routes, gradually adding pipelines that ran north of the western routes, especially in the Caucasus-Caspian Sea area. While China and the European Union pursued east-west energy transportation networks, Russia and the United States vied for north-south routes from Kazakhstan to India via Iran and Pakistan. The United States was further interested in developing a pipeline from Siberia to California.

The increased energy demands of China and India in the early 2000s recentered the Middle East. Kazakhstan, Turkmenistan, and Tajikistan, not Iraq or Saudi Arabia, were now at the center of an intense competition that created a so-called Cold Energy War and ignited a line of conflict from Iraq to Afghanistan, irritated ethnic unrest in Xinjiang, and prompted stirrings of unrest in Tibet and Nepal. To deal with the new complex issues of energy security, trade, transportation, development, ethnic separatism, and terrorism, several regional organizations such as the Shanghai Cooperation Organization (SCO) were created, and regional development initiatives flourished under the aegis of the United Nations, such as the Greater Tumen Initiative, a trade, energy, and industry corridor through Manchuria. The North Atlantic Treaty Organization (NATO) continued to expand its role in keeping the peace along the Silk Roads.

This new Silk Road of the twenty-first century revived ancient, parallel, and multiple rail, road, and pipeline routes, with extensions to Laos

➤ REAL AND VIRTUAL TRAVELS

Today the Silk Roads are still a mysterious place that inspires movies, documentaries, novels, and travel diaries. Depicted in works such as Louis L'Amour's *The Walking Drum* (1984), the James Bond film *The World Is Not Enough* (1999), the *Nature* television series featuring Julia Roberts's horseback travels through Central Asia (2004), and Colin Thubron's *Shadow of the Silk Road* (2006), romance, history, and danger continue to attract adventure seekers and capture the imagination of individuals from all walks of life.

World-famous cellist Yo-Yo Ma's Silk Road Project, which he started in 1998, as of 2009 continued to provide opportunities for a virtual travel experience across time, space, and culture by encouraging the documentation, preservation, and sharing of a myriad of Silk Roads cultures and traditions. Started mainly as a musical education endeavor, his Web site features a wide range of cultural seminars, musical performances, and educational resources on a host of issues. Yo-Yo Ma's goal is to give back its voice to this ancient and pivotal world region and to allow it once again to "connect the world's neighborhoods."

—Alice-Catherine Carls

and Tibet in the east and to Tangier and Europe in the west. The grid was older and denser in the Caspian Sea-Persian Gulf area while newer from Kazakhstan eastward, and the grid quickly gained in complexity. The inland routes were complemented by the revival of the maritime Silk Roads between the United Arab Emirates and China, the linking of Australia to the eastern portion of the Silk Roads, the extension of pipeline grids to Western Europe and North Africa, and the creation of a maritime route in the Great North, alongside Russia's northern shores. Other bold initiatives included the use of new technologies to transport oil and liquefied natural gas underwater in areas such as the Caspian Sea, the Bering Straits, and portions of the Mediterranean and Baltic seas. After a century of temporary foreign-mandated arrangements, the Silk Roads asserted itself in the new millennium as once again the geographical pivot of history. The new geopolitical possibilities, however, could not hide

the political and civilizational fractures or the fact that issues of regional balance, foreign influence, regional development and cooperation, consolidation of national identities, and energy security were still very much in need of direction before a lasting peaceful new order could be found.

■ Introduction: Global Tourism

Tourism can be defined in various manners, but normally it is thought of as traveling for nonbusiness reasons or, more positively, as traveling for pleasure. Tourism arguably began when the first human wandered into territory that was occupied by someone else, thus engaging the 'other' in our current language. With the development of multiple means of transportation, tourism increased. Today tourism is also a business, and a brisk one at that, bringing in some \$94 billion in the United States alone in 2004. As tourism has increased international and interregional connections, the practice has influenced major world historical patterns and most recently is related to the rise of globalization.

As part of European colonial and imperial expansion, tourism increased in the nineteenth century. Elite Europeans with the financial means and sufficient leisure time began traveling to locales that were considered exotic, including Latin America, Africa, and Asia. A significant number of these travelers wrote about their experiences, and these books were devoured by the literate public back home. Today these nineteenth-century travel accounts are an important genre for historical study, since many of the cultures that were visited by Europeans did not have a written language. Thus, the details that are found in these accounts are valuable to historians, though the narratives are often rife

with significant bias from the pens of haughty Europeans.

Tourism increased notably in the twentieth century due to the increasing availability of transportation options as well as the growth of a middle class with expendable income. Trains and steam engines, then automobiles, and finally airplanes extended the reach of the tourist industry throughout the twentieth century. Soon middle-class people were finding the wherewithal and leisure time for occasional travel within and between countries. A new source of information and entertainment regarding distant lands appeared with *National Geographic* magazine. Like its predecessor, the Victorian travel account, *National Geographic* contained plenty of questionable representations of exotic "others," though in recent years the publication has exhibited more sensitivity. The articles and especially the photographs encouraged many readers in the developed world to consider tourist travel.

Social science and public attitudes progressed over the twentieth century, moderating the ethnocentric attitudes exhibited in tourist literature. Anthropologists in particular began to rethink their approach. Gone are the days in which anthropology meant the study of traits of exotic cultures, and anthropologists now understand that their very presence within a cultural setting has an influence. As with tourists, the anthropologists' presence is recognized, not always posi-

tively. Early British anthropology was devoted to studying cultures viewed as primitive, carrying the colonialist assumption that the positive force of progress would improve the lot of the uncivilized. This subtle hegemony has been replicated in the postcolonial period as tourist destinations such as Cancun, in Mexico, created for the enjoyment of wealthy foreigners have been built upon previously pristine landscapes.

The growing recognition of the often deleterious environmental and cultural impact of visitors has encouraged alternative forms of tourism at the turn of the twenty-first century. Included in these are ethnotourism and ecotourism. In essence, these tourists are traveling with a sincere interest in understanding, and perhaps participating in, different cultures and environments.

Ecotourism in particular has been very successful in multiple regions. A visit to the Web site of the Institute of Ecotourism reveals some of the themes of the new tourism in their Covenant of Mutual Regard: "to appreciate nature, respect and care for the Earth, and live in harmony with the environment." Ecotourists visit a variety of natural settings, with the idea that these should remain undisturbed and, thanks to their payments, protected from development. Visits to Native American regions accomplish similar objectives. This new tourism is seen as socially responsible but is also more intellectually rewarding to a growing segment of the developed world's population than simply lying on a beach (though there is some leisure built into most ecotourism itineraries).

Related to the ecological sensitivity expressed in ecotourism is the growing acceptance of ethnotourism in Latin America, the Caribbean, and Asia. Curious Westerners travel to locations they view as exotic with a desire to understand other cultures on their own terms. In the Americas, for example, tourists might visit Embera peoples in Panama or Huichol Indians in western Mexico, engage in conversation with these "others," witness ceremonial celebrations, and learn about local flora and fauna. For their own part, native peoples benefit economically, helping them to maintain control of traditional lands against the determined encroachment of modernity.

Just as tourists have developed and reported their own images of other places and people,

tourists themselves have been represented in sometimes stereotypical fashion. The best known of these are Japanese tourists. Japanese tourists are ubiquitous in many countries, well known for their love of photography. As a society they send as many tourists out into the world as any other, with the possible exception of the United States. In Hawaii alone in 2006, for example, 1.4 million Japanese visited, spending \$2.1 billion.

American tourists are also recognized stereotypically as they travel. Due to the strong military and political presence that the United States holds in the world, tourists are sometimes threatened when they travel. Additionally, they are also understood as visitors from a supremely wealthy and exotic world, whether or not they are in fact wealthy in their own land. In truth, however, tourists are usually welcomed across the globe, since their presence can aid the local economies that they visit.

Tourism and Postcolonialism

Tourism is among the most important, if misunderstood, elements of global culture. During the twentieth century, it evolved into one of the most profitable and potent industries in the world. Tourism has emerged as an important medium for representing and encountering cultural difference and as a fundamental feature of development projects designed to improve economies and societies. Yet tourism also makes plain the history of colonialism and its reworking in the postcolonial world.

➤ ECOTOURISM

Ecotourism, or ecological tourism, is a distinctive subset of the tourism industry that developed in the 1980s. It focuses on an alternative to standard tourism in which travelers are introduced to native flora, fauna, landscapes, and culture. This type of tourism is specifically slated toward the environmentally and socially conscious. Ecotourism requires large wildlife or ecological preserves and the careful protection of indigenous cultures and, in turn, provides economic stimulus for preservation and conservation. Some criticism of ecotourism revolves around the fact that in many regions offering ecotourism, indigenous cultures are marginalized in order to create preserves and are denied technology in order to cater to the tourists' craving the so-called authentic. And as with any tourism, it can have a negative impact on the environment. Ecotourism is becoming common worldwide.

Although made possible by colonialism, which centers on the occupation of foreign places, often for the management of land, communities, and resources, tourism stresses the movement through and the consumption of culture. Indeed, while appropriation and control remain paramount, tourism concerns itself with marketing places, pleasures, and performances deemed traditional, distinctive, and even exotic. These conditions foster romantic and nostalgic attitudes among many tourists that encouraged them to seek out peoples and places on the margins supposedly unspoiled by modern life or Western culture.

Tourism relies on stereotypical images of formerly colonized peoples and places. These images essentialize and exaggerate, reducing complex societies to clichés. Importantly, these representations derive in part from colonial interpretations of cultural difference, given popular form in travelers' tales, administrative reports, anthropological studies, and world's fairs.

To attract visitors, tourism transforms traditional dress, crafts, and rituals as well as historically important and picturesque locations into objects that may be bought and sold. This process of commercialization distorts and disrupts

local practices, threatening the internal functions and historic meanings of art, ritual, and spirituality. Moreover, external values dictate the significance of cultures put on display in the tourist industry. To a large extent, the tastes and funds of tourists determine both the content and the development of cultures visited by tourists, shaping what is deemed beautiful, valuable, and important.

Despite the obvious inequities of tourism, it remains an important development strategy, with promises to infuse communities with much-needed money while granting peoples on the margins entry to the global community. And tourism does offer tangible benefits, including employment opportunities, improved infrastructure, increased land values, and a higher standard of living. Some critics argue that these benefits are short-lived and, worse, that these improvements pale in comparison to the massive profits enjoyed by multinational corporations and external cultural brokers.

While lacking formal structural power, frequently formerly colonized people do use tourism to make statements about themselves and the world. Tourism facilitates the efforts of local cultures and state institutions to formulate identity, community, and history. Through tourism, some indigenous peoples have maintained and even revitalized traditional practices. Tourism has also promoted anticolonial activism. Struggles over sacred sites transformed into tourist sites, such as Devil's Tower in the United States and Ayer's Rock in Australia, have energized sociopolitical movements to curtail recreational usage of such sites and to expand indigenous peoples' rights.

Tourism contributes to globalization by reworking European imperialism in more ambivalent, less visible forms. The neocolonial contexts structured by tourism manifest the effects of commodification, pronounced stratification, and disturbing stereotypes while granting to cultures toured limited opportunities for development, sovereignty, and equality.

Automobile Culture

Throughout the twentieth century, the automobile has been a major force in shaping world culture, with its effects most clearly pronounced in the United States. The revolutionary potential of the automobile was unleashed in 1908, when Henry Ford began to manufacture an automobile that would be not just a plaything for the rich but also a durable means of transportation, affordable to all people. By the mid-1920s there were over ten million cars in the United States, with nearly half of them the Ford Model-T. While the Model-T helped reshape the way people lived their lives, the automobile became an even more powerful force in the United States after World War II. With the development of new suburban communities came interstate highways, motels, gas stations, automobile showrooms, shopping centers, malls, and fast food strips, an entire land reshaped for the automobile.

The automobile has not only held together consumer culture in the United States but also remains one of its centerpieces. As early as the 1920s, General Motors rose to prominence when it began to introduce new automobile models with varying options on a yearly basis along with advertising campaigns that assured people that status depended on owning the latest design. While the Great Depression of the 1930s and the wartime production of World War II slowed down automobile manufacture and sales, the postwar years saw a steady rise. In 1945 in the United States there were 26 million registered automobiles. By 2001 that number had increased eightfold to about 200 million.

As the U.S. population shifted toward the new suburbs following 1947, national resources were continually diverted toward highway construction. In 1956, during the Eisenhower administration, \$25 billion was authorized to fund interstate highways, with the federal government paying 90 percent of construction costs. The construction of the Eisenhower National System of Interstate and Defense Highways became the largest public works project in U.S. history. Much

THE VW CAMPER VAN

It is rare that the sight of a Volkswagen (VW) Camper Van does not elicit thoughts of freedom, independence, and adventure, and there are few places where a VW Camper Van has not been sighted. These iconic automobiles have taken passionate and dedicated owners to all areas of the world, across continents, through deserts, over mountains, and on dirt roads and modern highways. The conversion of the VW Transporter and subsequent VW bus models into campers changed the way people vacation and travel. Originally marketed as a family vehicle, the VW Camper was embraced by the 1960s' counter-culture and continues to be symbolic of the era. As the counterculture spread to other countries, so too did the popularity of the VW Camper. For others, the VW Camper Van has always provided an inexpensive way to experience adventure, from camping with the family on a weekend holiday to traveling across the world in 17 months.

After the first Campmobile was introduced in 1951 by the Westfalia Company, several different companies followed suit with their own conversions that included burners, running water, a sink, beds, cabinets, and curtains. Later conversions included other items such as refrigerators and toilets. Volkswagen itself never actually manufactured a camper but instead partnered with several companies to officially sanction certain conversions. There are numerous examples of conversions and customizations, some of which were not officially recognized by Volkswagen.

Camper Van owners are passionate about their vehicles, often naming them while spending much time and money restoring and customizing their vans. Owners share their passion with others through local, national, and international groups and events.

—Katie Elson Anderson

of the funding came through taxes on gasoline and car sales, and the 1956 Interstate Highway Act required that the tax-based Highway Trust Fund be used only for highway construction.

Many states in the United States, urged on by automobile interests, also placed amendments to their constitutions that required that state gasoline tax revenues be used only for highway funding. In contrast, in Great Britain, high taxes

on gasoline instead had been diverted to fund rail systems. It was not until 1973, during the first of the oil shortages, that President Richard Nixon signed a compromise bill that diverted federal highway funds to mass transit. By then, however, except in a few major cities, mass transit and passenger rail were no longer viable alternatives in the United States. In contrast, in Great Britain, Japan, and much of Europe, even with the rise of the automobile and automobile culture, government funding had ensured the survival of healthy rail systems.

Throughout the twentieth century, the automobile became central to work and industry and also to leisure. In the 1920s, Henry Ford and high-profile friends including Thomas Edison, Harvey Firestone, and the naturalist and poet John Burroughs went on well-publicized automobile camping trips, bringing along a cook and other amenities, including a generator for electric lights. A craze for car camping followed. Driving as a form of entertainment also became common. One sociological study of the 1920s, Robert and Helen Merrill Lynd's *Middletown*, argued that the automobile was revolutionizing society: it brought families together on weekend excursions yet also encouraged an independent and rebellious youth culture. Youths became captivated by speed and the freedom of the road. Even in small towns, car thefts became common as early as the 1920s.

The automobile and its associations with freedom and speed helped shape postwar automobile culture and its folklore. Beat writers such as Jack Kerouac celebrated the freedom of driving in his novel *On the Road* (1957). Rock 'n' roll singers also celebrated the automobile and teenage courtship on wheels in hundreds of songs, including Chuck Berry's "Maybelline" and "No Particular Place to Go." Fast food restaurants catered to teenage cruising culture, while teen car enthusiasts created customized and high-speed automobiles for show and for illegal races that later became institutionalized in circuits such as the National Association for Stock Car Auto Racing (NASCAR), founded in 1948, with its first race track at Daytona, Florida.

Meanwhile, U.S. roadside culture became standardized as vacationers desired fewer unpleasant surprises at restaurants and motels. Early

car cabin camps and motels gave way to large chains such as Holiday Inn, offering standardized accommodations. Holiday Inn began with one motel in 1952, 26 in 1956, and over 1,000 in 1970 and has since continued its globalization. Howard Johnson pioneered the standardized chain restaurant with his first orange-topped restaurant in 1935 that expanded to 150 restaurants across the United States by the outbreak of World War II, each offering his famous 28 flavors of ice cream. Richard and Maurice McDonald opened their first hamburger stand in San Bernardino, California, in 1940. By 1952 they ran six self-serve restaurants that offered high volume and quick customer turnover. They then sold their franchise formula to Ray Kroc, who set up 228 new McDonald's restaurants in the next five years. Kroc learned from the McDonald's brothers several secrets: every McDonald's was created on an identical pattern, with an open kitchen that appeared as Spartan and clean as the rest of the facility; the chain also did away with waitresses, car hops, and jukeboxes and offered hard seats to discourage customers from lingering after meals.

The counterculture of the 1960s and the oil shocks of the 1970s helped sustain the first serious critiques of automobile culture in the United States. Concerns over air pollution and later global warming have increased demands for regulation, and governments have responded with measures that have ensured higher safety standards, improved fuel efficiency, and decreased pollution emissions. But the automobile is far from an endangered species. Since 1950 the number of passenger cars produced each year worldwide has increased from 8 million to 46 million. As of 2004, the United States and Europe each harbored about 27 percent of the total passenger vehicles in the world. Lacking alternative mass transit, the United States continued to be the largest gasoline consumer, using 44 percent of all gasoline in 2004. Developing nations, however, are also shifting to car culture. While there were only about 100,000 passenger vehicles in China in 1991, there were 2.3 million in 2004, a figure steadily rising with China's growing affluence. A similar trend is emerging in India with the growth of its middle class.

Heritage Tourism

Since the end of World War II, tourism has become the world's largest industry. While leisure travel had been an elite endeavor for wealthy Europeans dating back to the 1600s, it was not until the late nineteenth and early twentieth centuries that tourism on a mass scale developed. The relatively recent emergence of large-scale tourism has been attributed to, among other factors, a general decrease in working hours, leading to an increase in leisure time for many people; surpluses in discretionary income; colonial relationships that incubated notions of the exotic; and the related impulse to experience the authentic. The pursuit of education and authenticity has given rise to what is called the manufactured heritage industry.

Manufactured heritage is the culturally constructed identification that an individual may extend to a national or local past. This identification, however variable its authenticity, has been an important driver for tourism, especially since 1945. Travelers seeking authentic historical experiences have often unwittingly settled for traditions that have been compromised by political or economic expediency.

In the past few decades, with the availability and relative affordability of long-distance travel, heritage tourism has grown dramatically. A heritage tourist destination can take multiple forms. Its most popular manifestations are often places of historical memory; this often includes battlefield sites such as Gettysburg or Waterloo, locations of important political events tied to na-

tionality such as Independence Hall in Philadelphia, and locations of religious significance such as Santiago de Compostela in Spain. Tourists are driven to these destinations, in theory, to discover themselves through an exploration of some component of their heritage. In return, the heritage tourist destination can impose a system of beliefs onto the visitor through multiple schemes such as signage, publications, souvenirs, and guided tours.

Colonial Williamsburg in Virginia is a classic example of a heritage tourist destination. The site consists of renovated buildings constructed during the period 1699-1780 as well as historical actors whose job is to portray the era in terms of dress, speech, and job tasks. The purpose of Colonial Williamsburg is to re-create and represent daily life in an important early American town. Colonial Williamsburg set a precedent for numerous open-air museums that strive to educate visitors as to their own backgrounds and heritages. Such sites often attract criticism. Colonial Williamsburg in particular has been criticized for its sometimes inaccurate or incomplete portrayals of history. Many debated, for example, whether or not Colonial Williamsburg should include actors portraying the town's former slave population. While some argued that this type of reenactment has no business at a tourist destination, others argued that Williamsburg's slave population must be accounted for in current representations.

In the early 1990s Disney, one of the most recognizable brands in global tourism, planned to build a Disney America theme park in Virginia. The park was to include historical themes such as the U.S. Civil War, immigration, and the life of Native Americans. Public criticism of these plans, based upon perceived insensitivities on behalf of Disney, ultimately led to the rejection and canceling of Disney America. Disney, however, was successful in later creating California Adventure, a theme park that promotes the California Dream. Visitors can experience Disney's version of the Golden Gate Bridge and a Hollywood film studio back lot in a single trip. While many visitors to the park may not necessarily consider California as a part of their heritage, the park is also meant to appeal to a distinct thread in American identity, exalting modernism,

» SPACE TOURISM

Space travel for private citizens is no longer reserved for science fiction. In 2001, Dennis Tito of the United States became the first individual to purchase a trip outside of Earth's orbit, assisted by the Russian Aviation and Space Agency. Since Tito, others have successfully made the trip into space, some even docking at the International Space Station. A fledgling industry of space carriers and governmental agencies has been scrambling to profit from this trend. Most notably, Richard Branson's Virgin Group, Hilton International, and British Airways have all expressed interest in serving the space travel market. The 2003 space shuttle Columbia disaster halted space tourism temporarily, but travel resumed soon after.

The desires behind space travel are similar to those that motivate more typical tourism. The search for adventure, uniqueness, and status can be applied to either form of tourism. The democratization of tourism, in which more and more people are able to participate in more and more types of travel, may have prompted space travel as an elitist reaction to mass tourism.

The pitfalls and difficulties that are a part of space travel are considerable. Besides the logis-

tical problems of space flight and its inherent danger, a host of tourism-related problems are still unsettled. The transition to any sort of mass space travel is decades, if not centuries, away. Basic human necessities such as eating, sleeping, and defecating are significantly different away from Earth's atmosphere. Current space tourists spend over a year training and preparing themselves for the journey. In addition, there are no facilities in space that are in any way comparable to even the most Spartan of tourist destinations on Earth.

Yet the lure remains. Aurora borealis, the brilliant display of lights visible from regions around the Arctic Circle, may soon become the most visited attraction in space. A partnership between Virgin Galactic (a division of the aforementioned Virgin Group) and the Swedish company Spaceport is planning to send private tourists into the northern lights for a considerable fee. Scheduled to commence in 2011, the trip will originate in the northern Swedish town of Kiruna and will last for approximately two hours. As of 2007, space mania has gripped Sweden and indeed much of Europe as tourism entered its newest frontier.

—Kevin Goldberg

entrepreneurialism, and technological know-how. Shopping malls have also been developed as heritage sites, as at the South Street Seaport in New York City.

Heritage tourism has now informed at least three generations of tourists around the globe. In fact, tourist destinations that rely on heritage as their *modus operandi* have become so ubiquitous that we no longer see them as unique. At these sites, visitors gain some sense of history but a version that is often smoothed to ease the consumer experience.

—Kevin Goldberg

Sex Tourism

In the postwar period, following the massive deployment and stationing of Allied soldiers in various locations throughout the world, occupy-

➤ “NATASHAS”—THE EAST EUROPEAN SLAVE TRADE

Following the collapse of the Soviet Union and the Eastern Bloc in the early 1990s and the period of crash capitalism that followed, many East Europeans plunged into poverty as the many nations that constituted the post-Soviet region adapted to the uncertainties of market capitalism. Women were particularly vulnerable in light of the disappearance of Soviet guarantees of employment and as most available jobs were reserved primarily for men. Russian criminal syndicates, taking advantage of this situation, created a market for the trafficking of women into the European Union, Turkey, the Middle East, and East Asia. Commonly known as “Natashas,” under the assumption that all East European women were Russian, these slave-prostitutes (various estimates range from the hundreds of thousands into millions) remain a tragic element of the modern international trade in prostitution and the complexities of increased globalization. As brilliantly depicted in the film *Lilya-4-Ever* (2002), some of these women are underage teenagers, trafficked to satisfy the demand of pedophiles.

By promising work abroad as servers, nannies, or office workers, traffickers made travel arrangements through seemingly legitimate firms for

mostly young East European women eager for employment and the excitement of the outside world away from the miseries of home. Upon arrival, these women’s passports would be seized, and they would be raped and beaten (“broken in”) and sold for sex. With vague promises of freedom after they worked off their debt, these women would be subjected to repeated sex acts, up to as many as 40 partners in one day, with little or no food. Threatened with the murder of loved ones in the country of origin if they talked and subject to deportation if they informed, many of these women suffered years of this deplorable condition. The countries of origin of many of these women such as Moldova, Belarus, and Ukraine have done little to stop this illicit trade, given that much of the proceeds of these illegal enterprises are a considerable portion of needed foreign exchange entering their countries. While countries in the West (the United States, the European Union, and Canada) have recently begun to crack down on the trafficking of women from Eastern Europe, criminal syndicates have become more careful in their activities, illustrating that much still needs to be done to end this modern form of slavery.

—Abraham O. Mendoza

ing military authorities and regional governments encouraged the development of local brothels for servicemen. Various countries in South and East Asia, Central and Latin America, and Oceania developed a sex tourism industry to cater to soldiers, businessmen, and travelers. From 1945 to the present, countries such as Thailand, the Philippines, Costa Rica, the Dominican Republic, and Cuba have developed an illicit sex tourist industry, based on the exploitation of local women and men to cater to foreign tourists seeking sexual gratification outside the West. Aspects of this illicit industry, such as human trafficking (especially from Eastern Europe and Russia in the post-Soviet era), slavery, indentured servitude, the exploitation of children, and the spread of HIV/AIDS have led to instances of international condemnation. However, many of these countries are dependent on and reluctant to curtail this industry.

Many Western countries, such as the United States (in Nevada), Switzerland, New Zealand, the Netherlands, and several Australian states have developed forms of legalized prostitution, heavily regulated to address health and workplace concerns. In countries such as Britain and Mexico, where prostitution is illegal, it is unofficially tolerated as a victimless crime. However, while these regions have a thriving localized sex industry for both locals and travelers, an illicit sex industry offers younger prostitutes, often children or underage teenagers, coerced by their pimps into engaging in more explicit sex acts. This attracts a clientele of Western, mostly male, tourists willing to pay increasingly large amounts of money to travel to exotic tropical locations to engage in sex with young adults and/or children for a low price. While some enter prostitution voluntarily from local areas, a considerable portion of the prostitutes are slaves illegally trafficked

from abroad. Many of these young women are offered jobs abroad as hostesses, entertainers, or secretaries by seemingly legitimate agents. Upon their arrival in a foreign country, their passports are seized; they are repeatedly beaten and raped and then sold to work off their debt. Children, both boys and girls, are taken from their parents or from orphanages or even sold by their parents into prostitution.

Typically, black market operations or legitimate travel agencies arrange trips to these foreign destinations for the purpose of illicit sex. In recent decades, through the use of the Internet, many sex tourists find it easy to arrange travel packages that include flights, hotels, various sexual encounters with young women or children, and other travel accommodations. Countries such as Thailand, the Philippines, and Costa Rica thrive on these arranged tourist packages, run largely by international crime organizations. Many neighboring countries (Myanmar, Malaysia, India), seeing the economic advantage of the thriving sex tourism industry, have developed their own utilizing similar models.

International condemnation, mainly stemming from the West (typically the country of origin of the overwhelming majority of sex tourists), has erupted in the past decade against the use of human-trafficked sex slaves, both young women and children, for use in the illegal sex tourist trade. In the United States, the Child Exploitation and Obscenity Section enacted initially in 1987 and constantly revised to address emerging issues ensures that those who profit from the trafficking of children for sexual purposes and those who travel to engage in sex with children are prosecuted to the full extent of the law within the United States, even if they commit their crimes abroad. Other federal statutes in the United States prohibit sex tourism and the international sex trafficking of adults and children. The European Union (mostly Britain, France, and Germany), Japan, and Australia, faced with similar problems, have been slower to enact legislation to deter their nationals from engaging in illegal sex tourism.

Cruise Ship Industry from 1945

The *Caronia* was launched by the Cunard Line in 1949 under the British flag. It was the first ocean liner designed exclusively for leisure cruising instead of point-to-point passenger service. Painted three shades of green, the *Caronia*, nicknamed the “Green Goddess,” was 715 feet long, held 932 passengers, and was known for its round-the-world cruises. When the *Caronia* helped launch the cruise ship industry, luxury travel on ocean liners still flourished. But with the onset of transatlantic air passenger service, pioneered in the late 1950s, ocean passenger travel began to fade as an option.

In 1957 the Cunard line of 12 vessels was the world's largest passenger ship service and carried a third of all passengers crossing the Atlantic Ocean. Two of the world's most famous ships, the *Queen Mary* and the *Queen Elizabeth*, were both part of Cunard's fleet. France's flag ship the *Liberté* was also very popular at this time. The *Liberté* was known for its exquisite decor, outstanding service, and the best cuisine on the Atlantic. The pride of the American ships was the *United States*. The ocean liner industry expanded through the 1950s, and a passenger record was set in 1958 when over 1 million passengers sailed in over 30 ships. Yet the same year Pan Am flew a nonstop jet airplane flight from New York to Paris for the first time ever. Ironically, just one year later, airlines would set the record with 1.5 million passengers, while the figure for passengers by sea fell to 900,000. This marked the beginning of the end for destination service by ocean liners but the start of the cruise industry.

In the 1960s most shipping lines were not ready to exclusively offer leisure voyages. Instead, they opted to provide point-to-point passenger service with off-season cruise service. While recognizing that cruising would provide the only chance for profitable operations, cruise lines

quickly found that most ocean liners were ill-suited as cruise ships. Most liners of the day had physical segregation of classes that restricted passengers to either the forward or stern of the ship. This made it almost impossible for passengers to get from one end of the ship to another. In addition, required changes to the cargo space and engine machinery for cruising resulted in many otherwise worthwhile ships being scrapped. A notable exception to this was Holland America's *Rotterdam*. Instead of vertical class segregation, the *Rotterdam* had alternating decks allocated to first and tourist classes. All passengers had access to the entire ship during cruising, but sliding panels within the staircases separated classes to their specific decks when sailing as a point-to-point liner. Just as the cruise industry was beginning to grow, another disaster in 1973 further reduced the viability of ocean liner service. In just a few months the price of fuel oil soared to \$95 a ton from \$35 a ton. This brought the end to all passenger ship service, with the only surviving Atlantic liner being Cunard's *Queen Elizabeth 2* (QE2). Although the QE2 represents the end of a romantic era in maritime history, it is far from the end of luxury sailing.

The passenger point-to-point transportation service of ocean liners was soon replaced by jet airline flights, but the new concept of ship travel as a vacation unto itself had begun. By the mid-1970s vacationers began to discover the relaxing and relatively inexpensive option of cruising. Cruises offer vacationers a variety of exotic destinations such as the Caribbean, Alaska, Hawaii, or the Mediterranean along with continuous shipboard activities, dining options, and accommodations. The cruise industry has grown rapidly, making it an important segment of the tourist industry, which now is the world's leading industry. By the late 1970s the number of passengers taking cruises was one million per year. In 1985 the number of passengers exceeded two million, and by 2004 over ten million people took a cruise. The corresponding cruise ship count has also grown. Forty new ships were built during the 1980s, an additional 80 ships were built during the 1990s, and from the year 2000 up until the end of 2005 68 new ships were launched. The size of the typical cruise ship has also grown

dramatically since the 1970s. Typical of ships in the late 1970s to early 1980s was the twin sister ships the *Island Princess* and the *Pacific Princess*, both featured in the U.S. television series *Love Boat*, which first aired in 1977. The Norwegian *Norway* was rebuilt in 1982, with a length of 1,035 feet (about 315 meters) and a passenger capacity of 2,181. The economies of scale that brought financial success to the *Norway* started a parade of ever-larger cruise ships. As of 2006, the largest operating cruising liner by capacity is Royal Caribbean Cruise Line's *Voyager of the Seas*, with a passenger capacity of 3,840.

Critics of the cruise industry cite problems such as hidden expenses, shipboard illness, and the industry's possible harm to the environment. The cost of many cruise vacations ends up being much larger than the initial payment after vacationers pay for bar drinks, photos, spa visits, shore excursions, casino losses, and increased charges to dine in alternative restaurants. In 1997 successive outbreaks of the Norwalk virus from contaminated food led to the Norwegian Cruise Line's *Royal Odyssey* being pulled from service. In 1998 Princess Cruise Line's *Regal Princess* and in 2000 Clipper Cruise Line's *Nantucket Clipper* were each brought to port for sanitation service after disease outbreaks.

The cruise industry is likely to continue to grow along with tourism in spite of these problems. A study by the International Council of Cruise Lines found that in 2003 the North American cruise industry was a more than \$25 billion industry that generated almost 300,000 U.S. jobs.

■ Introduction: Global Migrations, Transnational Diasporas, and Responses

International migration patterns since the close of World War II have been influenced by many factors. The push factors include the dislocations produced by the war itself as well as tensions and new conflicts generated in the context of the Cold War and decolonization. During such conflicts, warfare's vagaries or the fear of outright genocide have become a powerful push factor for migration. Additional catalysts for migration include the push of economic impoverishment in the developing world and the pull of labor demands in the developed nations. Immigration has had a significant impact upon receiving countries, particularly in North America, Europe, and Oceania, not only in terms of the number of immigrants and refugees but also in the demographic shifts produced by post-1945 migration. Global population flows have also created vibrant transnational diasporic communities, often in places where they had not previously existed. However, global migration patterns also illustrate the glaring economic and population differences between the developed North and the developing South.

Nation-states with a European majority have grappled with the predominance of non-European migrants in post-1945 migration streams and the resulting complexities of ethnic pluralism. These states have adopted legislation barring discrimination on the basis of race or ethnicity and eliminated immigration restrictions based on race or ethnicity and national origin. Yet many groups of migrants, particularly undocumented (or illegal) migrants or those legally admitted to work in low-wage sectors (guest workers), continue to encounter interpersonal discrimination and limited access to resources. In particular, the large numbers of undocumented migrants as well as the presence of non-European migrants and refugees in general has prompted the emergence of anti-immigrant movements in the United States, Australia, and Europe.

The growing populations of Muslim immigrants in Europe's cities face similar economic and social marginalization as that experienced

by members of Latin American diasporas in the United States. Moreover, the Persian Gulf states (e.g., United Arab Emirates), flourishing due to their vast oil wealth, imported huge numbers of guest workers from South Asia and the Philippines to work in their service and industrial sector. Though some receiving countries with significant undocumented populations (including countries such as Malaysia and Thailand) have alternated between offering blanket amnesty and aggressive deportation and tightened border controls, the trend in the United States and the European Union in the early twenty-first century has been toward aggressive surveillance and militarization of border zones, reactions stemming from the possible overlap of illegal entry and terrorist attacks. Yet increasing border surveillance and militarization have not stemmed migration, particularly unauthorized migration, as the labor needs of capitalist economies, the dearth of opportunities in developing countries, political repression in authoritarian regimes, and other catalysts have continued to produce migration in the twenty-first century. Nonetheless, states with longer traditions of incorporating immigrants, such as the United States, have had comparatively less trouble accommodating and absorbing migrants than those, such as Germany, that have had little historical experience with migration flows such as those of workers from Turkey to German cities. In contrast, Japan has only cautiously allowed nonnational migrants. Its largest ethnic minority remains Koreans, many of whom are multigenerational descendants of labor migrants during the period of Japanese occupation of Korea. In the 1990s, however, Japan admitted a sizable number of immigrants of Japanese heritage from Brazil and Peru.

Contemporary dislocations created by war or widespread destitution, particularly in Africa, Central Asia, and the Middle East, have also contributed to the exponential growth of refugees residing outside of their country of origin. The Arab-Israeli conflict, the Congolese civil wars, episodes of ethnic cleansing in both Rwanda and

Sudan, and the wars in Iraq and Afghanistan, among other regional conflicts, have created sizable flows of refugees seeking sanctuary. A majority of the world's refugees reside in United Nations (UN) camps adjacent to their former homelands, coping with cramped and squalid conditions. However, some refugees seek better fortunes in the developed world of the global North and often find themselves unwelcome guests. As most of the world's refugees are people of color, developed countries in the global North are reluctant to accept them in large numbers due to increasing xenophobia, and they become subject to the same sort of institutional discrimination as economic migrants.

Abraham O. Mendoza*

Latin America and Migration, 1945–Present

In the aftermath of World War II there was an increase in migration to and within Latin America spurred by fears of political persecution, while economic motivations have resurged again in the most recent decades. After 1945 most Latin American countries entered a long period of inward-looking economic development and fewer international connections in order to develop strong national markets that included both producers and consumers, a logic that also contributed to driving down levels of immigration by explicitly blocking new entries. This meshed with strong nationalist campaigns across Latin America that hardened political and ideological lines between members and outsiders, when these distinctions had been more fluid at other junctures.

Still, there was an important influx of three mid-century refugee groups to Latin America. First, Jews from Central and Eastern Europe fled the Holocaust and its aftermath; they predominantly went to Argentina, Mexico, Brazil, and Cuba, joining with pre-Holocaust, mostly urban Jewish communities. Second, as the Soviet influence extended into Eastern Europe, refugees from Eastern Europe came to the largest cities of the Southern Cone (Argentina, Chile, and Uruguay). Third, conflicts in the Middle East in the 1950s prompted significant communities of non-

Israeli Jews to migrate especially to Brazil and Cuba, again joining previously established Jewish social networks. For economic reasons, a small cohort of South Koreans came to rural Argentina and Brazil but quickly urbanized.

After the Cuban Revolution in 1959 most Cuban refugees went to the United States, but a great number scattered throughout Latin America, especially Mexico, the Dominican Republic, and Venezuela. This inaugurated an era of intertwined political and economic migration within Latin America. Yet in contrast to the extensive Cuban diaspora, many of the other intraregional flows represent shifts toward magnets of relatively prosperous countries or those with open immigration policies. In several cases these immigrants received poor treatment in their destinations and tended not to enjoy opportunities for upward social mobility. This is the case with Haitians in the Dominican Republic; Guatemalans, Salvadorans, and Hondurans in Mexico; Nicaraguans in Costa Rica; Peruvians, Bolivians, and Paraguayans in both Chile and Argentina; and Colombians in Venezuela and Panama. In the Southern Cone, European immigrants of the early twentieth century experienced the exact opposite, with improved social and economic standing.

Smaller, scattered, but also more elite migration occurred in the 1970s as political dissidents fled into exile from the brutal dictatorships of the Southern Cone. These exiles sought asylum throughout the wealthiest nations, but many also settled in Mexico. At the same time, these military governments created conditions fortuitous for some highly specific commercial migrants seeking to establish businesses in Latin America, for example, Taiwanese immigrants who came to Argentina in the late 1970s.

Due to widespread, protracted armed unrest in several Central American countries that reached their worst points in the late 1970s and early 1980s, a significant outpouring of refugees came into Mexico. Some continued on to the United States and other destinations, but thousands of Guatemalans, Salvadorans, and Nicaraguans settled in Mexico.

The 1980s were a time of major economic stagnation throughout Latin America, leading to very little immigration—other than refugee

➤ GUATEMALAN IMMIGRATION TO MEXICO

It is common knowledge that emigration from Mexico to the United States is one of the most significant population flows in modern history; however, Mexico has also been an important destination country for immigrants. In the latter decades of the twentieth century, new arrivals came en masse from civil wars in Guatemala, Nicaragua, and El Salvador, constituting the largest inflows in Mexican history. The early 1980s were the peak years of both conflict and exodus, with Guatemalans coming in the greatest numbers in order to escape genocidal campaigns against rural Mayan populations in highland areas of Guatemala.

Tens of thousands of Guatemalans poured into refugee camps in the Mexican border state of Chiapas in the early 1980s. Many arrived in extremely poor physical condition in the wake of traumatic journeys from destroyed villages. As encampments ballooned, domestic political pressure grew to find some resolution to the ad hoc settlement of refugees in Chiapas. A controversial move was the relocation of some 15,000 refugees to the impoverished states of Campeche and Quintana Roo in the Yucatán Peninsula (where the state of Yucatán is also located). New camps in these sites sought to integrate Guatemalans into the Mexican economy and curtail outright aid. Skill-building programs and schemes similar to

contemporary workfare in the United States were implemented by authorities.

Guatemalans, compared to other refugees and immigrants, have faced some of the most extreme discrimination in Mexico. A majority of refugees from Guatemala arrived with few or no funds, and only a quarter had strong fluency in Spanish, tending to speak Mayan instead because they hailed from rural indigenous villages. Mayan ancestry further distinguished many Guatemalans in appearance, both in dress and physiognomy, from the great majority of mestizo Mexicans.

A few thousand Guatemalans have returned to their country of birth since civilian democracy was reestablished in the late 1980s. However, along with other Central Americans, there has been a stronger tendency to remain in Mexico as permanent foreign residents, with a smaller group choosing to naturalize as Mexican citizens. As in many countries, children born to foreign citizens on Mexican soil are automatically citizens of Mexico.

Mexico continues to receive immigrants from Central America as well as a number of other countries around the world. In the 2000s, however, enforcement of entry restrictions and deportation regulations has become especially strong compared with earlier historical junctures.

—Ryan Centner

flows—during that so-called lost decade. However, the economies of Latin America, especially in South America, began to change drastically in the early 1990s as sweeping reforms in compliance with international financial institutions were enacted to make these countries more globally competitive. Restructuring involved strengthening national currencies and opening entrepreneurial opportunities. In practice, neither of these strategies was productive, but they did attract global capital and new migrants, especially to the short-term success story of Argentina and to Brazil to a much lesser extent. Increased immigration came from Paraguay, Bolivia, Peru, and Chile, but there was also a renewal of flows from Taiwan and South Korea into Buenos Aires. With the fall of the Soviet Union, there was also

an influx of Russians and Ukrainians. Many came specifically because the peso was fixed with the dollar during 1991–2001, enabling refugees to earn high enough wages to send a portion to their sending countries as remittances.

Argentina also has had open immigration policies as a holdover from its period of peak migration a century ago. One group that came to Argentina in the 1990s was a number of Bosnian refugees whom then-president Carlos Menem had personally agreed to sponsor. However, this personalized style worked to the detriment of those coming from the former Yugoslavia as well as the former Soviet Union: despite the generous immigration laws in the Argentine Constitution, the president decreed these specific groups welcome as long as they forfeited all potential claims

on the Argentine state for citizenship or financial assistance. These groups have largely remained in enclave-like communities with the exception of the Russians who are Jewish and have integrated into the large and long-established social networks of Jewish Argentina.

Landmark legal decisions in Mexico since the mid-1990s, easing restrictions on Central American refugees, have allowed 5,000 Central Americans to naturalize, with some 30,000 formalizing their status as noncitizen residents. As of 2007, however, Mexican immigration authorities have conformed to pressure from the United States to strengthen entry controls, directed not only at Central Americans but also arrivals from around the world. This is in order to stem those who would use Mexico for easier overland passage into the United States. Among Latin American countries, Mexico thus now has the most stringent immigration policies with some of the toughest enforcement.

U.S. Immigration Policy, 1945–Present

The end of World War II and the beginning of the Cold War marked a significant turning point in American immigration policy. Ideology and international politics began to replace ideas about

race, ethnicity, and nationalism in the regulation of immigration. This shift led to two major changes: the creation of a refugee policy to complement the country's immigration policy and the move toward an emphasis on family reunion as an aspect of U.S. immigration policy. Within three years after the end of the war, Congress passed two laws that set the tone for the country's new approach to immigration. In 1945 Congress passed the War Brides Act to allow for the immigration of foreign-born spouses and children of U.S. military personnel. In 1948 and 1950 the full disclosure of the horrors of the Holocaust at the end of the war led the United States to pass two Displaced Persons acts to facilitate the admission of European refugees; 410,000 refugees entered the United States, but only about 1 in 6 admitted under these acts were Holocaust survivors.

The country's Cold War aspirations to be the leader of the free world found its fullest expression in the 1952 Immigration and Naturalization Act. The new law retained the quotas on immigration but eliminated all racial barriers to immigration and naturalization, expanded family reunion, and sanctioned the presidential parole power, which granted any future president the power to admit unlimited numbers of aliens "for emergency reasons . . . or in the public interest," as the country's basic principle for its refugee policy. Taking advantage of the family reunion provision, 63,000 Japanese immigrants came to the United States between 1952 and 1964 rather than the 2,000 sanctioned by the act. Using the parole power accorded to the government in dealing with refugees, Congress progressively expanded the definition of "refugee" to include people coming from outside Europe as well, namely people from China, the Far East, the Middle East, Cuba, Tibet, Vietnam, and other Southeast Asian countries. In 1980 the Refugee Act officially accepted the UN definition of "refugee," including asylees.

In 1965 the Hart-Celler Act dismantled immigration quotas based on national origins in favor of a preference system that reserved most annual visas for immigrants with relatives in the United States. The most significant difference between the 1952 and 1965 acts was the increased emphasis on family reunification. The 1965 law

► THE POINT SYSTEM AND THE CHANGING FACE OF CANADA

The 1962 and 1967 Immigration acts completely transformed Canadian immigration policy. The new legislation targeted immigrants with managerial and professional skills, emphasized family reunification, and defined a more humanitarian refugee policy. The two acts created an admittance rationale based on a point system that favored economic factors such as skills, education, and job opportunities rather than the origin of the immigrant. According to the point system, an applicant needed to obtain at least 50 out of 100 assessment units to be eligible for admission. The assessment system first evaluated good health and moral standing and then took into consideration employment opportunities in the area of destination and the applicant's education, training, adaptability, motivation, initiative, skills, age, arranged employment, knowledge of French and English, and relatives in Canada. The acts also prescribed that permanent residence could be granted to anyone regardless of origin, citizenship, country of residence, or religious belief as long as the applicants qualified by reason of education, training, skills, or other special qualifications. This new immigration policy brought to Canada an increasingly higher number of immigrants from Asia, Africa, and South and Central America rather than from Europe, the traditional source of Canadian immigration. While in 1966 76.25 percent of migrants to Canada came from Europe and 7.1 percent were from Asia, by 1992 Hong Kong, Sri Lanka, India, and the Philippines were the four countries that contributed the largest number of migrants to Canada. The point system has been revisited several times since its inception; as of 2009, applicants must obtain at least 67 out of 100 points in order to be eligible for admission.

—Maddalena Marinari

included parents of U.S. citizens to the category of immigrants admissible outside the quota provisions and assigned 74 percent of preference visas to family members as opposed to 50 percent in the 1952 act. Many hoped that the law would bring immigrants mostly from Europe; however, the majority of the new immigrants arrived from Asia, the Caribbean, and Latin America. By 1980,

80 percent of legal immigration to the United States came from Asia or Latin America.

By the mid-1980s, popular opinion again turned against immigration. Much like the end of the nineteenth century, a restrictionist coalition emerged that called for stricter immigration laws and tighter border controls. After five years of debate, in 1986 Congress passed the Immigration Reform and Control Act (IRCA). The new immigration law allowed 3 million undocumented immigrants to regularize their status, imposed diluted employer sanctions to limit illegal immigration, established a diversity program, and instituted a special agricultural worker program.

The IRCA, however, did little to appease disgruntled immigration critics, especially when it came to illegal immigration, which began to increase a mere three years after the passage of IRCA. To remedy some of its shortcomings, Congress passed 16 additional immigration laws in the ten years after IRCA. They primarily addressed adjustment of immigrant status or abuses of the system, including, among others, marriage fraud, the English-language requirement, and working visas. In addition, the Clinton administration launched Operation Gatekeeper in October 1994, which not only increased the presence of border control agents, but introduced new equipment to enhance the surveillance of undocumented migrants attempting to enter the United States.

The attacks of September 11, 2001, dramatically changed American immigration policy yet again. Right after the attacks, immigration critics abandoned their focus on the threats that immigration posed to social security and began to advocate for stricter immigration laws to prevent terrorism. On October 26, 2001, the Patriot Act granted power to conduct searches, employ surveillance, and detain suspected immigrants to protect the country's security. The primary goal of the law was to target people who could potentially support terrorism. The authorities detained several Muslim and Arab men for months or more without providing any criminal charges, deported many of them for minor violations, and closed down or prosecuted many Muslim charities.

Following the passage of the Patriot Act, Congress approved the Homeland Security Act of 2002. This law established a new umbrella

agency, the Department of Homeland Security, which unified formerly independent law enforcement and security agencies such as the Immigration and Naturalization Service (INS) and Customs Service in an effort to streamline communication and facilitate information sharing. The INS and Customs Service were themselves dismantled; two agencies, U.S. Immigration and Customs Enforcement (ICE) and Customs and Border Protection, were established to enforce immigration laws in the United States and to secure the border, respectively. The new orientation in immigration policy has curtailed transnational labor migration, reduced the issuance of student visas, and hindered mobility at ports of entry. Moreover, the country's renewed attempts to control the U.S.-Mexican border have resurrected animosity against legal and illegal immigrants from Latin America.

Migrations to Oceania since 1945

Since World War II, the number of international migrants to Oceania has increased dramatically. Immigrants from developing countries contributed significantly to the total population growth of major Oceanian countries such as Australia and New Zealand. By 2006, more than 6 million new immigrants had settled in Australia and New Zealand; almost all were from developing countries during the past decade. In particular, Asian immigration accounted for more than half of the gains in population in both Australia and New Zealand.

Before World War II, Europeans had long predominated in Oceania because of its colonial

history and the intentional prohibition of non-white immigrants. In Australia, the White Australia Policy carried on the British colonial legacy of nonwhite immigration exclusion for more than half a century, from the 1890s to 1950s. During the early postwar period, such immigration was still restricted; however, ethnocultural diversity started to grow when the Australian government launched an assisted passage scheme for immigrants from various English-speaking and non-English-speaking European countries in order to accelerate domestic population growth. In 1949 Harold Holt, the seventeenth prime minister of Australia, entitled 800 nonwhite refugees to permanent residency and allowed Asian immigrants to settle down in Australia. This event signaled the gradual relaxation of the White Australia Policy and triggered an immigration flow of nonwhite workers in Australia from the 1950s onward. It was not until the 1970s that the Australian government first adopted the policy of multiculturalism while officially abolishing the White Australia Policy.

In 1989 Australia implemented a new immigration point system aimed at attracting skilled immigrant workers. Today, nearly one in four people in Australia were born overseas. Although the United Kingdom remains the single largest source of immigrants to Australia, by 2007 the number of Asian immigrants had already reached more than half of the immigrant population. The present ethnic structure is a mix of about 74 percent Anglo-Celtic, 19 percent other European, and 4.5 percent Asian.

Postwar New Zealand faced a similar decline in population growth, posing a threat to national defense and economic development. As a result, the New Zealand government in 1947 applied an assistance scheme to bring in West European immigrants who were easily assimilated. This selective immigration policy, however, never stopped immigration from other ethnic groups to New Zealand. Beginning in the 1950s, young Asian students and other Pacific Islanders in the Oceania countries also immigrated to study or live in New Zealand. As the color of the population changed, so did attitudes about the national identity of New Zealanders. In 1974 New Zealand passed a nonracist immigration policy, requiring equal measures in admitting prospective

➤ AUSTRALIA AND THE *TAMPA* INCIDENT

On September 3, 2001, 433 refugees were moved from the Norwegian freighter *Tampa* to the Australian HMAS *Manoora*, which subsequently escorted them to Papua New Guinea. The transfer occurred off Australia's Christmas Island, close to where the Norwegian freighter had saved the refugees from a sinking smuggler-operated Indonesian ferry. Australia encountered fierce international criticism for not allowing the refugees, mostly from Afghanistan, to enter the country. Instead, Australian prime minister John Howard ordered the military to seize the *Tampa* when it insisted on entering Australian waters. The Australian government declared that these refugees were the exclusive responsibility of the governments of Norway and Indonesia. Most of the refugees were subsequently given asylum in Nauru and New Zealand after Australia's refusal to take them.

Australia has enacted stringent policies regarding the clandestine smuggling of refugees seeking asylum. Refugees who do manage to enter Australia are placed in refugee detention centers, typically outside major metropolitan areas or in the middle of the desert. Many of these policies are a result of Australian attitudes on the social and economic cost of absorbing asylum seekers. However, these actions arouse much controversy, as they violate international law regarding the rights of asylum seekers and refugees accorded to them by the United Nations. Nonetheless, Australia and other Western countries conflicted between excessive numbers of developing world asylum seekers and the political desires of their domestic constituencies will continue to grapple with issues regarding the status of refugees on their soil.

—Abraham O. Mendoza

white and nonwhite immigrants. Unfortunately, the effect of nonracist policy in attracting immigrants was weakened during the next 15 years because adverse economic conditions reversed immigration flow. Between 1975 and 1990 the most significant influx of immigrants was from the Pacific Islands. It was not until the 1990s that immigration to New Zealand reflected increases in size and ethnic diversity. Due to skill shortages, New Zealand followed Australia and established a new immigration point system to

accept skilled workers from all places outside of Europe. By 2006 the Asian population had reached 9.2 percent of the total population in New Zealand, an increase of almost 50 percent from 2001. Other major immigrant ethnic groups include Europeans and other Pacific Islanders, making up 80 percent and 6.5 percent of the total population, respectively.

As early as the late 1800s, most of the other Oceanian countries had been accepting immigrants from both European and Asian countries who contributed to shape their multicultural societies. During the postwar period, however, the influx of foreigners to the smaller Oceania countries has been less significant compared with those to Australia and New Zealand. Most of the immigrants are low-skilled workers.

Currently, there are three basic trends of immigration to Oceania: the migration of skilled workers, the affiliated inflow of their spouses and children, and student migration. Although family reunification continues to be a major reason for immigration, its share of migration has been declining since the 1990s. The other two groups of migrants have been expanding. Wealthy nations such as Australia and New Zealand keep spiriting trained professionals away from developing world countries. Oceania's higher education institutions also encourage students from Asian countries to enroll and have assisted with simplified visa and application procedures.

The high concentration of immigration in the large cities has also shaped new urbanization patterns in Oceanian cities and is responsible for the urban expansions and economic development. However, the population movement to Oceania has also raised many public concerns about such environmental issues as carrying capacity and the sustainability of urban areas. In addition, ethnic segregation has emerged in many cities, posing challenges as Oceanian governments attempt to maintain social cohesion and urban inclusion among diversified socioeconomic and ethnic groups.

Political Refugees—Africa and Asia, Post-1945

According to Article 1 of the 1951 United Nations (UN) Convention relating to the Status of Refugees, a refugee is anyone who "owing to a well-founded fear of being persecuted for reasons of race, religion, nationality, membership of a particular social group or political opinion, is outside the country of his nationality and is unable or, owing to such fear, is unwilling to avail himself of the protection of that country." Global developments since World War II have fueled refugee crises in every continent.

In Asia, almost every country has been either a refugee-producing country or a refugee-receiving country since World War II. Afghanistan, Bangladesh, Cambodia, China, India, Indonesia, Iran, Iraq, Japan, Laos, Malaysia, Pakistan, the Philippines, Singapore, Sri Lanka, Thailand, Tibet, and Vietnam are but some examples.

The most famous Asian refugee population is the Indo-Chinese refugees, resulting from the extended Vietnam War. The Indo-Chinese conflict began in 1946 when the people of Vietnam, Laos, and Cambodia fought to gain independence from France. The conflict continued into the 1960s and 1970s when the United States entered the stage in order to control a strategic region and to prevent the spread of communism. Al-

PALESTINIAN REFUGEES

One of the best-known ongoing refugee crises followed the 1948 Arab-Israeli War. In 1947, after the British government announced that it would cease its control over the mandate area of Palestine as of 1948, the United Nations (UN) brokered the partition of Palestine into Jewish and Arab states. On May 14, 1948, a day before the British left, the Jewish settlers declared a state, and a war ensued between the settlers and the armies of the adjoining Arab states. The war was won by Israel, and various armistice agreements were signed by Israel, Jordan, Egypt, Syria, Lebanon, and Iraq during the first half of 1949. The conflict resulted in a large number of Palestinian refugees (at least 700,000). Israel still is unwilling to allow the refugees or their descendants to return or settle in its territories. Reasons for this include the continued state of conflict, severe disagreement between the government of Israel and Palestinian political leaders, and the fact that if the Palestinian refugees were allowed to return, the Palestinian population would be much larger than the Israeli population, creating a large voting bloc. There are Palestinian refugee camps in Gaza and the West Bank (within the boundaries of the old UN-planned Palestinian state) and in Jordan, Syria, and Lebanon. The Arab states have given a home to the Palestinians but have been unwilling to grant them citizenship. Beyond the Arab countries mentioned, the Palestinian diaspora has spread across the globe.

—Cherie Taraghi

though the Vietnam War essentially took place in Vietnam, in reality the war spread to all three countries. During the 1960s and 1970s all three countries also experienced instability and political confusion as various nationalist, ethnic, communist, and other political groups and factions struggled to gain power and establish political control in each of the countries. Thousands from each country fled to neighboring Thailand, and over time many of these were resettled in various Western countries such as the United States, Canada, and Australia.

Until the 1960s, Europe and Asia were the main producers of refugees. There were fewer

refugees in Africa, for most of the continent was then under relatively stable colonial rule. However, by the 1990s, almost half of the world's refugees originated from Africa. Most African refugee flows commenced with decolonization. Some of the best-known examples of conflict for independence resulting in massive flows of refugees spring from French Algeria and the Portuguese colonies of Angola, Mozambique, and Guinea-Bissau.

The Algerian War of Independence, which began in 1954, is of particular importance because this was the first African struggle against European colonial rule in the postwar period to produce significant numbers of refugees. Neighboring Tunisia requested assistance from the UN High Commissioner for Refugees (UNHCR). This was the first occasion in which UNHCR assistance was requested in the developing world, and the UNHCR's decision to support Tunisia in 1957 represents a shift in the UNHCR's self-perception and role. It became an organization offering universal help. In the following year, refugees from Sudan and Rwanda flowed into Uganda, while refugees from Mozambique began flowing into adjacent countries in 1966.

In 1969, the Organization of African Unity (OAU) recognized that aspects of the African refugee problem were not covered by the 1951 Geneva Convention. The OAU passed a regional supplementary convention, known as the OAU Convention Governing the Specific Aspects of the Problem of Refugees in Africa. This convention has tried to overcome the restrictive nature of the refugee definition by adding to it the following clause: "Every person who, owing to external aggression, foreign domination or events seriously disturbing public order in either part or the whole of his country of origin or nationality is compelled to leave his place of habitual residence in order to seek refuge in another outside his country of origin or nationality." Unlike the 1951 Geneva Convention, this definition is extended to include people who flee from war or disturbances. It allows for whole groups to be granted refugee status rather than demanding individual assessment.

One of the latest refugee crises in Africa is the conflict (still ongoing in 2009) in the Darfur region of Sudan. This conflict is largely the result

of ethnic discrimination. The ruling regime in the capital of Khartoum has attempted to consolidate power for Sudan's Arab minority since its assumption of power through a military coup in 1989. Rebel groups comprised mostly of the three non-Arab ethnic groups that populate the region of Darfur mounted an insurgency in 2003 in reaction to their political and economic marginalization and to several violent attacks waged against non-Arabs on the part of the Janjaweed (Arab militias) with the support of the regime in Khartoum. Attempts to suppress the rebellion through the coordination of the government's military forces and the Janjaweed have quickly escalated into a genocidal war against the non-Arab ethnic groups in Darfur. Since the start of the conflict, some 300,000 men, women, and children have died; 2.6 million people have been displaced from their homes; an unknown number of girls and women have been raped and abused; and over 200,000 people have become refugees.

Political Refugees—Europe, Post-1945

After the defeat of the Axis powers at the end of World War II, the displacement of large numbers of slave laborers, prisoners of war, and concentration camp survivors created huge logistical problems for the occupying Allied forces in Europe. This resulted in the creation of camps for displaced persons (DPs) throughout much of Germany under Allied military authority. Many of these refugees had fled the advancing Red Army fearing the worst in addition to having suf-

➤ EXPULSION OF EASTERN GERMANS

After 1945 the three largest groups of *Volksdeutsche*, or people of German ethnicity residing outside of Germany, were in Czechoslovakia, Poland, and the Soviet Union. Prior to World War II, an estimated 3.5 million Sudeten Germans formed the largest minority in Czechoslovakia. These Germans lived in clusters near Germany and Austria in places where their ancestors had settled for generations, in some cases for centuries. When Poland emerged as an independent nation, the German minority lived primarily in the areas of West Prussia, Posen, Danzig, and Upper Silesia. This group numbered approximately 2.1 million people in 1919.

At the war's end in 1945, however, the Beneš decree allowed for the expulsion of Germans from many European territories based primarily on their presumed collective guilt. As a consequence, nearly 3 million Germans were expelled from Czechoslovakia (Sudetenland), 0.7 million from Poland, and a total of 1 million from other countries, including Hungary, Yugoslavia, Romania, Bulgaria, Italy, and even some overseas countries.

After several waves of deportation in 1941–1945, various Germanic settlers who remained scattered throughout the European parts of the Soviet Union, including the most substantial group of Volga Germans, ended up in Siberia and Central Asia. Even though many ethnic Germans there shared a common hatred toward the Soviet Union, only 40,000 Germans were allowed to emigrate from the USSR to Germany and other countries between 1955 and 1989.

Between 1989 and 1996, however, over 1 million ethnic Germans moved to Germany, taking advantage of new laws that granted full citizenship to

Volksdeutsche of the (former) Soviet territories. To regulate this inflow of newcomers, in 1993 the German government issued a law, *KriegsfolgebereitNigungsgesetz*, that set a quota for ethnic German emigration from Eastern Europe (mostly filled by ethnic Germans from the Soviet Union) at 225,000 per year.

By the early 1990s, the German government realized that its loose definition of German ethnicity and its policy of substantial benefits bestowed on *Aussiedler* (resettler, immigrant) had created more problems than it solved. Overwhelmed with the financial responsibility of supporting these emigrants, the German government reduced the emigration quota to 100,000 per year in 2000. The government also set new criteria for emigration and reduced the length and availability of some benefits. The number of Germans moving out of Eastern Europe began to decline in 1997; nevertheless, in the decade that followed, some 800,000 Germans from the former Soviet territories moved to Germany.

ferred extreme privations under the Nazi Third Reich. Some feared returning home to what was to become the Soviet sphere of influence in Eastern Europe. As a result, hundreds of thousands of Poles, Hungarians, Jews, and Czechs were allowed to enter Britain, France, and Germany as political refugees. Others decided to go elsewhere, such as Canada, the United States, Palestine (Israel after 1948), and Australia. These refugees readily adapted and assimilated to their new homes, seeking to break ties with their coun-

tries of origin. The establishment of the United Nations Relief and Rehabilitation Administration (UNRRA) in 1943 created an effective bureaucracy for handling provisions, camps, and immigration for refugees.

The ideological and political division of Europe during the Cold War into the capitalist West and the socialist East essentially provided East Europeans with a readily available sanctuary to escape communism. In particular, the Federal Republic of Germany (West Germany) took it

Yugoslavian refugees at an asylum center in Germany, 1992. (Régis Bossu/Sygma/Corbis)

upon itself to be the refuge of choice for political dissidents from the socialist German Democratic Republic (East Germany). The Berlin Wall was constructed in 1961 to stem the flow from East Germany westward. Following episodes of political dissent to Soviet repression within the Eastern Bloc (Poland in 1956, Hungary in 1956, and Czechoslovakia in 1968), increasingly large numbers of political refugees streamed to the West for sanctuary from state persecution. The exodus of dissenters within the Eastern Bloc seeking their way into the West lasted well until the end of Soviet domination of Eastern Europe (1989–1991).

Given the postwar attitude in regard to refugees in various West European countries, created partly to make up for the closed-border policies they had enacted in the interwar period (1919–1939), refugee policies were also quite generous to political refugees from the non-European world. Non-European refugees, escaping from communist regimes and political and economic collapse throughout the developing world, found their way into Western Europe. France found itself home to hundreds of thousands of Vietnamese refugees escaping the devastation created by the Vietnam War. The Scandinavian countries—Denmark, Norway, and Sweden—opened their borders to refugees escaping wars in the Middle East. Britain found itself accepting former colonial subjects fleeing the political breakdown back in their home countries in such places as Kenya, Nigeria, and

Bangladesh. The Yugoslavian civil wars (1991–1998) drove many Serbians, Croatians, and Bosnians to Germany (unified after 1990) seeking protection from the ethnic cleansing policies of Serbian leader Slobodan Milosevic and the displacements created by warfare.

European refugees, having settled in their new homes and livelihoods, now contend with far different issues than escaping from the abuses of their former countries. Nativist reactions due to the cultural and religious practices (such as Islam) of refugees have made European countries rethink their policies on refugees, especially those concerning non-Europeans. Second- and third-generation non-European refugees, having adapted to the cultural norms of their respective countries, contend with issues of discrimination, racism, and inequality. However, the second- and third-generation descendants of European refugees have a considerably different experience than that of non-Europeans, having had a better experience in assimilating to West European culture.

Political Refugees—Americas, Post-1945

From the end of World War II to the present, both North and South America experienced a widespread surge in the number of refugees from other regions of the world due to political persecution, economic hardship, or social stratification in the countries of origin of these wayward sojourners. Canada, the United States, Mexico, Argentina, and Brazil, among others, ex-

perienced massive waves of foreign refugees seeking a safe haven from their troubles at home. Further dislocations created by Cold War conflagrations and developing world instability have seen further waves of refugees both from outside and from within the Americas.

At the conclusion of World War II in 1945 Europe lay in shambles, with millions of displaced persons (DPs) unable to return home and often reluctant to do so. Many people, taken as slave laborers into Germany, were particularly unwilling to return to their countries of origin in Eastern Europe. Many Jewish refugees, having suffered tremendously under the Nazi regime, did not consider Europe home anymore. In light of this predicament, both Canada and the United States allowed significant numbers of refugees to enter their borders throughout the late 1940s and early 1950s. Jews, Germans, and thousands of other homeless DPs were allowed to migrate to North America and also, to a lesser extent, to South America. Many Italians and Germans found their way into Brazil and Argentina after the war. Some Nazi war criminals found this situation advantageous in order to escape prosecution for war crimes, changing their identities to migrate to Argentina or Uruguay. The most notable was Adolf Eichmann, a chief architect of the Final Solution who was captured by the Israelis in Argentina in 1960.

The emerging Cold War also led to a further surge in refugees seeking asylum from Europe in the Americas. The military and ideological divide between an American-dominated Western Europe and a Soviet-occupied Eastern Europe contributed to international tensions within Europe and abroad. East Europeans, fleeing from Soviet and Eastern Bloc police states, found sympathetic asylum in the West. Instances of political dissent within the Eastern Bloc to Soviet repression (as in Poland and Hungary in 1956, and Czechoslovakia in 1968) led to significant numbers of political refugees. Hungarians, Czechs, Russians, Ukrainians, Germans, and Poles made their way to the Western Hemisphere, finding new homes from Canada to Argentina.

Developing world refugees have characterized migrations after World War II. Considerable numbers of inter-American refugee migrations have occurred due to Cold War conflicts and

➤ OPERATION PAPERCLIP—NAZI SCIENTISTS IN THE UNITED STATES

Operation Paperclip, known also as Project Paperclip, was the code name under which American intelligence and military services retrieved German scientists from the Third Reich during and after the latter stages of World War II to be utilized for U.S. military objectives. The project was carried out by the newly established Joint Intelligence Objectives Agency in 1945. Although they had originally planned to only interview German rocket scientists, this drastically changed after Allied military officials sent a telegram to the Pentagon on May 22, 1945, regarding the evacuation of German technicians and their families from Nazi Germany as urgently important to strategic objectives in the Pacific theater, where hostilities had not yet ceased. There was also the objective of not allowing the Soviets to attain access to German scientists in light of the early phases of the Cold War.

Scientists specializing in rocketry, nuclear physics, chemistry, and weaponry systems were actively sought out through Operation Paperclip. The majority of the scientists involved with the development of the V-2 rocket were sheltered with their families at a housing project in Bavaria within the American Occupation Zone. Operation Paperclip remains a controversial chapter in the history of World War II and the Cold War given that many of these men were sympathetic to National Socialism and its ideological objectives. However, in the context of the Cold War, American officials believed that securing the nation against Soviet aggression far outweighed prosecuting these men for their active collaboration with the Nazi regime.

—Abraham O. Mendoza

military repressions. Cuban and Haitian refugees, escaping their repressive countries of origin, have settled in sizable communities in the United States. The emergence of Fidel Castro and his oppressive regime after the Cuban Revolution led to a large migration of Cubans (1959–1980). To this day, some Cubans continue to risk the dangerous waters separating them from Florida in pursuit of asylum in the United States. After the military overthrow of Jean-Bertrand Aristide, thousands of Haitians fled by boat to escape the

subsequent government-sanctioned repression. A number of these refugees were repatriated by the United States back to Haiti following a period of detention in Guantanamo Bay, although many were allowed to stay, particularly in Florida. In addition, approximately 1 million Salvadorans were displaced during the Salvadoran Civil War (1975–1982). Nearly half went to the United States, most settling in Los Angeles. There was also a large movement of Guatemalans in the 1980s to the United States and southern Mexico as they tried to escape from civil war and genocide.

Refugees from outside the Americas, particularly non-Europeans, have also been migrating in increasing numbers. However, public opinion and economic constraints have forced North American governments to restrict their refugee policies considerably, resulting in fewer people being granted asylum. Several hundred thousand Southeast Asians, Vietnamese, Laotians, Cambodians, and Hmong have entered the United States since the end of the Vietnam War, most of them settling in communities along the West Coast. Significant numbers of Lebanese, escaping the endemic warfare in Lebanon in the 1980s, have migrated to Brazil, creating the largest community of Lebanese outside of Lebanon proper. Conflicts in Africa have also led to small numbers of refugee migrations to the Americas but in lesser numbers than other groups previously mentioned. Contemporary conflicts in the Middle East have also contributed to small numbers of Iraqis and Afghanis entering the United States and Canada as refugees.

Refugees from Ecological Disasters

Ecological disasters are among the most powerful factors generating human displacements, as they often leave no choice but to flee from one's place of residence. Industrial accidents such as the release of a radioactive cloud from the Three Mile Island nuclear plant in 1979 and catastrophes potentially related to human-induced climate warming, such as hurricanes and floods, plague entire towns, regions, or countries in sudden, brutal, and generally unforeseen ways and sometimes lead to mass migration. Other push factors—in the terminology proposed by Everett Lee in his famous push/pull theory of migration of 1966—such as unemployment, lack of economic opportunities, or political persecution seldom hurt each and every inhabitant of an area and usually induce more gradual emigration patterns.

Although a distinction can be made between truly natural disasters (earthquakes and tsunamis represent the best examples) and man-made ecological disasters such as the explosion of the Chernobyl nuclear reactor (1986), this dichotomy has become more and more blurred by the indirect effects of human activities, from global warming to deforestation and land erosion.

During the third quarter of the twentieth century ecological displacements, often linked to food scarcity, went largely unnoticed and unregistered by migration experts because they took place in what has become known as the South (replacing the notion of the Third World). They were, to a certain extent, overshadowed by the economic migration flows of guest workers from southern to northern Europe, *braceros* from Mexico to the United States, and former colonial subjects from Africa and Asia to ex-colonial powers. The international awareness of ecological migration grew, however, during the last quarter of the century; Egyptian scientist El-Hinnawi coined the very concept of environ-

mental refugee in 1985. Some of the most striking examples of mass displacements can be found in Africa. Millions of nomads and peasants were forced to settle in cities during the 1969–1974 drought in the Sahel, 500,000 during the floods of 1985 in Benin, and more recently hundreds of thousands in Nigeria (1994, 1999), Ghana (1995, 1999), Sierra Leone (1996), and Mozambique (2000). Many displacements also took place in the rest of the world, especially the Middle East, Central and South Asia, and South America. For example, it is thought that the periodic droughts plaguing northeastern Brazil between 1960 and 1980 contributed to the decisions of 3.4 million people to emigrate.

Studies in different parts of the world show that several general statements can be made concerning the migration responses to environmental disasters. First, it is clear that even the worst disasters are neither mechanically followed by migration nor are the unique cause of displacement. Economic, social, and political contexts play an important role in mitigating or accelerating flight. People who are regularly hit by catastrophic events, such as floods in Bangladesh, have developed sophisticated ways to cope with disasters without necessarily having to migrate (such as forecasting, warning systems, flood insurance, and relief and rehabilitation schemes). In other cases, the victims are simply too poor to flee, or the warning comes too late. This was the case for the chemical tragedy of Bhopal (1984) when, despite the severity of the accident leading to the death of thousands of people and illness for hundreds of thousands, there was virtually no population movement. In other cases, governments sometimes forcibly evacuate entire populations, as in the Chernobyl area for about 135,000 Ukrainians and in the Three Mile Island area for around 143,000 Americans.

Second, an important distinction can be made between sudden disasters (such as industrial accidents, pollution, hurricanes, earthquakes, and floods), which rarely generate large-scale long-lasting migration because people generally come back as soon as they can and show an impressive will to rebuild their homes and reestablish themselves, and slow changes of the environment (such as droughts, deforestation, sea-level change,

> TUVALU

Nine islands, totaling 10 square miles of land scattered across 500,000 square miles of ocean in the western South Pacific, constitute the independent republic of Tuvalu. Although remote and with a scant 11,000 inhabitants, Tuvalu has become highly significant to other nations in the environmental forum. Tuvalu is a prime example of the threat posed to maritime countries by the environmental upheaval of a changing climate. Tuvalu's highest point is 5 meters (16 feet) above sea level, but most of the island's land mass hovers at only 1 meter (3.2 feet) above the Pacific. Its people depend on subsistence farming and fishing. As average world temperatures increase, around Tuvalu water levels could rise 1.6–3.1 feet (50–95 centimeters) by 2100. As a result, Tuvalu could virtually disappear.

water scarcity, etc.), which more often, but not always, have enduring migratory consequences.

Guest Worker Programs and Migration—Western Europe and the Middle East

Europe in the post-World War II period, characterized by widespread destruction and displaced populations, required immediate economic and infrastructural reconstruction in order for nations to ensure the livelihoods of their citizens. As a result, Britain, France, and Western Germany

➤ JEAN-MARIE LE PEN AND THE NATIONAL FRONT IN FRANCE

Jean-Marie Le Pen, leader of the far right Front National party, waves in front of a banner declaring "Separation of school and state" at a rally in Paris in 1985. (Jacques Haillot/Corbis)

The fate of France's former guest workers and their descendants in French society has drawn considerable attention in French politics. Far Right nationalists, through the auspices of Jean-Marie Le Pen's Front National (FN) party, have brought increasing awareness to the debate over the position of immigrants and their children in French society. Le Pen was able to place second in the first round of presidential elections in 2002, illustrating the concerns of many French constituents over Muslim immigrants in France. The FN's position on imposing quotas on immigration, especially on people from North Africa and the Middle East, has proved to be controversial in domestic French politics. The party itself has linked the presence of immigrants in France with high unemployment and growing crime rates as well as with global Islamic terrorism. The FN consistently has portrayed immigration as a threat to French national identity and cultural values. While the FN has sought to develop a respectable image in French politics, Le Pen has continued to publicly make racist and anti-Semitic statements. This popular Far Right party in France is an example of European xenophobia at the turn of the millennium.

—Abraham O. Mendoza

brought in foreign guest workers from abroad in order to remedy labor shortages resulting from the war and the rapid expansion of their economies. Guest workers were expected to work temporarily and return to their native countries after a certain period. In the three-decade period known as the European Economic Miracle (1945–1973), guest workers contributed to the growth and expansion of the western European economy. However, in the midst of the global economic troubles of 1973 stemming from the global oil crisis, guest workers were seen as a threat to their host countries in both economic and racialized terms. Nonetheless, many guest workers had already settled in their respective homes and established families and roots in their local communities. As a result, both guest workers and their host nations had to adapt to political and social circumstances and negotiate the position of foreigners in a multicultural European society.

For Britain's postwar economic reconstruction, guest workers were recruited from former colonial dominions in Southeast Asia and the Caribbean. As members of the newly formed British Commonwealth of Nations (which included most of the former empire), these guest workers were allowed into Britain with the full rights of citizens. Blacks from the Caribbean and Muslims and Hindus from India, Bangladesh, and Pakistan were the most prevalent of the guest workers in Britain. From the outset, their position in British society was circumscribed to a second-class status in terms of living conditions and pay. Relegated to live and work in poor dilapidated areas of England's industrial sectors, such as London's East End and similar urban areas in the Midlands, Birmingham, and Liverpool, guest workers developed a sense of consciousness of their separate and unequal position in British society. Racial, cultural, and religious discrimination on the part of greater white society, which stigmatized British guest workers, encouraged these groups to mobilize socially and politically.

In the late twentieth century, British society had attempted to grapple with issues regarding its former guest workers by embracing multiculturalism. British Asians and blacks had become sizable minorities within the British Isles and had

in turn demanded social, political, and economic changes to ensure their prosperity and integration into greater British society. Disputes over housing, labor, education, and discrimination increasingly allowed British ethnic minorities to make inroads into British politics and institutions. However, while they adapted to their new homes, they retained their distinctive cultural and religious characteristics, which continues to make them suspect to many within the indigenous British population. The Muslim population in particular has been subject to increased suspicions after the July 7, 2005, London bombings by British Islamic terrorists.

France had conscripted foreign labor from its North African dominions during the interwar period (1919–1939), and these policies continued following the end of World War II. Spanish and Italian laborers had also been recruited from time to time, given the geographic proximity of their countries of origin. French recognition of their colonial subjects as French citizens granted them full civil rights within the French republic. However, the position of Algerians, which made up the bulk of guest workers in France, was similar to the positions of blacks and East Indians in Britain. Giant suburban housing facilities characterized by residential towers in enclosed areas became sites of intense guest worker migration. Segregated in these housing projects outside major metropolitan areas, guest workers were able to continue in their religious and cultural folkways unhampered by French culture, although they were subject to social and economic discrimination. However, the gradual deterioration of these housing projects and the growing crime related to the increasing poverty of these areas associated ethnic minorities with social ills in popular French consciousness. The rising social disparity between the native French population and the guest workers and their offspring gave rise to social tensions between both groups in the late twentieth and early twenty-first centuries.

The Federal Republic of Germany (West Germany) recruited guest workers (*Gastarbeiter*) mostly from Turkey but also from other parts of Europe such as Spain, Portugal, Yugoslavia, Greece, and Poland. The migrants, who were

mostly men, were allowed to work in Germany for a short period (one to two years) before returning home. Large numbers of these migrants did not return to their countries of origin, staying in Germany legally, and were eventually joined in Germany by their families. The children of *Gastarbeiters* were born in Germany but were not granted citizenship; instead, they were granted the right to reside (*Aufenthaltsberechtigung*). After they settled down and formed ethnic minority communities, the German government and society ignored the integration of the migrants. This eventually led to widespread educational, religious, and social discrimination of foreigners in West Germany. A significant factor contributing to the development of these problems was German birth laws, which did not automatically grant citizenship to those born in the country. Those born of foreign parents were accorded the nationality status of their parents. The largest foreign population in Germany was Turkish, and they were often characterized as Islamic and non-European and were subjected to overt discrimination and acts of racist violence.

An increasingly large German foreign population continues to struggle with integration into greater German society. Problems over social and economic conditions continue to plague the relationship between Germans and what are perceived to be its non-German populations. Turkish and Kurdish immigrants and their descendants, while living in Germany, continue to have ties to their homelands, which also make them suspect to German authorities in light of recent global international terrorism networks linked to German foreign nationals.

Guest Worker Programs and Migration—Asia

Trans-Asian labor migration, a defining feature of Asian globalization prior to 1940, comprised mainly Chinese and Indian immigration to Southeast Asia and was quantitatively and qualitatively as significant as European transatlantic migration. Asian migration was consistent with industrialization in Europe and the demand for export production that strongly affected Southeast Asian economies and societies. Although migrant work-

ers were regarded as sojourners, they established diasporic communities in the colonies. After World War II and the decolonization process, unskilled labor migration halted for several decades and gave way to new patterns.

Since the 1980s Asia has reemerged as a major player in global migration in terms of its scale, diversity, and significance, and it is estimated that Asian migrant workers comprise about 33 million of total migrant stocks worldwide. The emergence of new regional migration patterns, the fast growth in the demand for professionals

and skilled migrants in particular occupational categories, and the creation of subregional labor markets are all manifestations of the scale and diversity of migratory movements in the region. Key factors accounting for this development include a divergence in economic growth between countries, labor shortages due to demographic transformations and structural change, and the role of social networks in the migration industry.

Asian countries may be classified into three broad categories regarding migration: emigrant producers, immigration centers, and countries that combine both functions. The first category, emigrant producers, includes the Philippines, Bangladesh, India, Pakistan, Sri Lanka, Nepal, China, Cambodia, Burma, Laos, Vietnam, and Indonesia. South Korea, Japan, Taiwan, Singapore, Hong Kong, and Brunei fall into the second category, immigration centers, while Malaysia and Thailand are in the third category.

Asian labor migration may also be divided into two systems. The first involves predominantly low-skilled workers who are employed as guest workers in low-status and low-paid occupations in the Asian Tiger economies (Singapore, Hong Kong, Korea, Taiwan, Malaysia, and Thailand) and the Middle East. These workers are from South Asia (India, Bangladesh, Nepal, Pakistan, and Sri Lanka) and Southeast Asia (Indonesia, the Philippines, Burma, Thailand, and Vietnam). The key features of the guest-worker system include employment on a temporary rotation basis, recruitment through intermediaries, off-shore recruitment procedures, the provision of assisted passage for workers, repayment of advances through salary deductions, employment with a specified employer, fixed-term employment, and the obligatory return to the country of origin upon completion of the contract. The guest workers are also admitted under a variety of arrangements varying from bilateral agreements and memoranda of agreement to unilateral programs.

The second system involves knowledge workers and skilled professionals, predominantly from India, Bangladesh, Sri Lanka, Pakistan, and the Philippines, who go mainly to North America, Europe, and Australia but are also drawn to the Asian Tiger economies and to middle-income countries such as Indonesia. Most destination

➤ MIGRATION FROM THE PHILIPPINES

The Philippines is second only to Mexico as a labor exporter. At the end of 2003, more than 7.7 million Filipinos were temporarily or permanently living abroad. The Filipino migrants sent at least \$8.5 billion home in remittances in 2004.

countries have made policy adjustments to attract knowledge workers and some categories of skilled migrants and are admitting them for settlement. Some countries such as Australia, New Zealand, and Singapore also encourage overseas students who graduate from their universities to settle in a two-step migration process.

Finally, in the current geopolitical environment, the sharp increase in labor mobility and undocumented migration has coincided with more stringent immigration policies and tighter border controls by destination countries. In Malaysia and Thailand, which attract large numbers of undocumented migrants, the state has alternated between amnesties and regularization of undocumented migrants and mass deportations.

Guest Worker Programs and Authorized Migrations—Americas

Guest worker programs in the Americas range from government-sanctioned unskilled worker programs through bilateral agreements (U.S.-Mexico) and the manipulation of visa programs to attract high-skilled labor from the Third World for lower wages than the domestic work force (U.S.-India, U.S.-China U.S.-Argentina). Toleration of itinerant worker populations fluctuating between two neighboring countries (Argentina-Bolivia, Venezuela-Colombia), while not an official

► SILICON VALLEY AND INDIAN MIGRANT LABOR

In the late 1990s and culminating in the year 2000, the dot-com bubble officially burst as high-tech stocks plummeted and dozens of software firms went under, particularly in California's Silicon Valley. Drove of high-skilled professionals found themselves out of jobs due to mass dismissals and company bankruptcies. Thousands of dollars in stocks, often offered as perquisites with employment, rapidly vanished in value over a short period of time. As American corporations sought to restructure themselves to remain competitive and profitable, the pursuit of foreign workers became a tactic that enabled U.S. corporations to lower their labor costs tremendously.

East Indian guest workers, often with graduate degrees from Indian universities, became readily available. They were brought in to fill a growing number of positions in the early 1990s, enabling companies to avoid paying large salaries to domestic workers and to depress the wages of those who remained. American high tech firms continue to advocate the HB-1 visa program, even to the extent of requesting governmental reforms to allow greater numbers of foreign workers into the country. In a letter to the U.S. Congress, Hewlett-Packard CEO Carly Fiorina stated: "To remain competitive in the future and to help keep jobs here in the United States, U.S. employers must be able to recruit and retain highly educated workers, many of whom have been educated and trained at our own universities." This point of view illustrates the need of the U.S. high tech sector for lower-wage foreign labor to ensure global competitiveness and high profits.

—Abraham O. Mendoza

guest worker program, serves the same function. These authorized migration flows within the Americas or to the Americas from outside the Western Hemisphere are symptomatic of the increasing economic interdependence of world regions following the end of World War II. They are characterized by the relationship between the expansive economy of the host country versus the declining economy of the immigrants' country of origin.

The most documented example of guest worker programs in the Americas is that of the United States and Mexico known as the Bracero Program. During World War II the United States faced a labor shortage in the agricultural sector due to war mobilization, characterized by governmental economic planning and the absorption of the domestic labor force into military forces and war industries. This resulted in the creation of the U.S. Bracero Program (1942–1964) along with the Mexican government, which allowed Mexican guest workers to enter the United States to work as farm laborers for a fixed period of time. Agribusiness in the United States was obligated to provide room and board, while the U.S. government assumed the responsibility for recruitment and transportation. These programs continued well into the 1960s due to the reliance of U.S. agribusiness on cheap labor, which resulted in profits for management and wage depression that weeded out domestic agricultural workers.

Relatively higher wages than those achievable in Mexico attracted many Mexican laborers to seek their fortunes in the United States. However, increasing reliance on growing numbers of undocumented workers, who were cheaper to hire than braceros, and disputes over the living and working conditions of guest workers eventually led to the end of the Bracero Program. In addition, domestic farm laborers, particularly the unionized United Farm Workers under Cesar Chavez, protested the continuance of the program as the cause of wage depression in the agricultural sector. Nevertheless, this program contributed to future migration flows from Mexico into the U.S. Southwest and California, as prior migrants established substantially large Mexican communities throughout this region. Current agricultural guest worker programs in-

volve contracts between individuals and American corporations that utilize work visas for short-term work in the United States.

Another form of authorized labor migration prevalent in the Americas is characterized by the host country's official toleration of migrant labor from neighboring countries that contributes to the economy of the host country. Two cases of this phenomenon are Bolivians in Argentina and Colombians in Venezuela. While these cases are not structured government guest worker programs, the reliance on these migrant workers in unskilled labor sectors is seen as necessary to the expansion of the national economy by both host countries. Bolivians migrate to Argentina in order to fill unskilled labor needs in construction, trade, and industry. Given the proximity of the two countries, most Bolivian workers return to Bolivia after the work season is over or after they have saved enough money to purchase land or start a business. Colombians migrate to Venezuela for the same reasons that Bolivians migrate to Argentina: to escape the dire economic situation at home and to contribute to the needs of their families by sending back remittances from their wages. In both cases, migrant workers live and work amid enclaves of their fellow nationals, maintaining cultural networks and a sense of community, and return home seasonally or permanently. The host countries benefit from filling their labor shortages in low-skilled employment at low wages, while the source countries benefit from decreasing their domestic labor surpluses and ensuring a flow of capital in the form of remittances. Given the unofficial nature of these migrations, there are no official estimates on the population of these itinerant workers. Moreover, while there is an awareness of the situation and while politicians such as Hugo Chavez vocalize against it, not much is done, and it continues to be generally tolerated. This is also characteristic of the transnational economic relationship between the United States and Mexico in the early twenty-first century.

The increased globalization of world markets makes particular economic sectors vulnerable to foreign competition not only in the form of products but also in labor. The U.S. H-1B visa program, modified by the Immigration Act of 1990 in delineating the qualifications for foreign

individuals to be allowed entry for employment purposes, allowed various corporations, particularly in the high tech fields of computers and biotechnology, to bring in guest workers from South Asia and China who are paid at lower wages than the domestic workforce, resulting in the alleged displacement of the latter. In the early 1990s California experienced a widespread recession during which the computer industry in Silicon Valley restructured itself to remain competitive in the world market by laying off tens of thousands of domestic workers. Growing reliance on foreign high-skilled labor allowed companies to maintain high productivity levels with fewer employees while paying lower wages. Foreign recruitment for U.S. positions and the development of subsidiary branches in the countries of origin of Asian migrant labor allowed U.S. high tech firms to develop a steady, well-trained transnational labor supply, also allowing for the outsourcing of certain positions to these foreign locales. The 1990s' high tech industries economic crisis (or dot-com bust) and global recession led to increasingly larger numbers of H-1B workers in the United States and further outsourcing abroad in the high tech industry. Some domestic workers blamed H-1B laborers as the source of their unemployment rather than the underlying structural issue of globalizing multinational corporations seeking to increase their profit margins by utilizing worker visa programs, much like U.S. agribusiness firms did with the Bracero Program.

Although high-skilled migrant workers from East Asia, China, and Argentina benefit, earning higher wages in the United States than in their countries of origin, and have the potential to establish permanent residency, their restricted ties to employers as a condition of establishing permanent residence has all but ensured their silence about any negative workplace conditions or discriminatory attitudes they may confront.

International Exchange of Students in Higher Education

While going abroad to study at a university in a different country is certainly not a phenomenon of the twentieth century, the flow of students across international borders increased signifi-

cantly since the end of World War II. The integration of European countries into the political and military camps of the Cold War as well as the competition for influence among the non-aligned countries in Africa and Asia furthered and limited at the same time the growth of exchange programs and study-abroad opportunities for individuals worldwide. The U.S. Department of State's Fulbright Program enacted in the years immediately after the end of the war provided an innovative and comprehensive framework for international academic exchange. Between 1949 and 1971 a total of 67,842 non-U.S. citizens were given the opportunity to work and study with the financial support of this program in the United States, while 36,179 U.S. citizens were enabled to go abroad. More than half of the support granted by the Fulbright Program was directed toward students.

While there was no comparable formalized exchange program for the socialist countries, a remarkable number of students from Eastern Europe went to the Soviet Union for higher education. Unfortunately, exact numbers are not available. In contrast to Western exchange programs, the student exchange within the Comecon (Council for Mutual Economic Assistance) was largely a one-way street. The largest flow of students occurred from East Germany, Czechoslovakia, Bulgaria, and Cuba to the Soviet Union. In the 1980s more than 60,000 students went to the Soviet Union on an annual basis to study at its many universities. East German students of Russian language and literature (future elementary and high school teachers) were, for instance, required to spend one of their five years of university training at a university in the Soviet Union. After the disintegration of the communist system, this pattern virtually disappeared. The shift in language education in Eastern Europe from Russian to English significantly diminished, at least for the time being, the need for Russian-language immersion programs. Since the collapse of the Soviet Union, students from Eastern Europe instead sought university experiences in Western Europe and the United States. More recently, the number of international students who study at Russia's universities, however, seems to have slowly rebounded and increased beyond the scope of the Cold War period. How-

TOP HOST COUNTRIES FOR EXCHANGE STUDENTS

Host countries of international students with more than 10,000 international students in 2005

Country	Number of Students			
	1980	1990	2000	2005
United States	325,628	407,529	451,935 (in 1999)	590,158

ever, virtually all of these international students for whom we have information for 2005 came from former Soviet republics in Asia and Europe. In recent years, China as well has moved up significantly as a host country for foreign students and is now the fifth most popular country for foreign students behind the United States, the United Kingdom, France, and Germany. While only 39,000 foreign students were in China in 1997, in 2007 there were 195,000 students from Asia and the West.

As of 2005, Europe and the United States were still the major destinations for most students from Africa and Asia. There are, however, significant differences in the makeup of the foreign student population in France, the United Kingdom, and the United States. While nearly half of all foreign students in France are from Africa, Asian students form much larger groups in the United Kingdom and especially in the United States, where they represent nearly two-thirds of all foreign students. While the flow of students is still directed from the South to the North, exchanges within Africa and Asia should not be overlooked. Kyrgyzstan, China, and South Africa appear to have become new destinations for students from these continents.

The United States, the United Kingdom, and France represent a challenge to the diplomatic expectations of such exchanges. While they receive the largest numbers of international students from all over the world, they send only a very small fraction of their own students abroad. The exchange between the United States and Japan is a case in point: while in the 1990s Japan sent about 36,000 students to the United States annually, only 1,300 American students went to Japan for purposes of a university education. The same is true for China. While in the academic year 2001–2002 a total of 63,211 Chinese students went to the United States, only 2,942 American students went to China (as of 2007, however, that number increased to 11,064). When American students go abroad, they still seem to prefer the United Kingdom over any other country. In the academic year 2000–2001, 30,289 American students went to the United Kingdom compared with 16,127 who went to Italy, 16,016 who went to Spain, and 11,905 who went to France. Furthermore, in contrast to stu-

dents from Africa and Asia who come to their host countries in order to receive a degree, European and American students go abroad for a shorter period of time and receive their degrees from the institution in their home country. The accelerated European integration since the fall of communism in Eastern Europe has contributed to the integration of national university systems and the furthering of European exchange programs. European Union initiated programs such as ERASMUS, TEMPUS, and SOCRATES provide unprecedented opportunities for students to spend some time in another country.

International students tend to concentrate in specific fields, especially in natural sciences and engineering. Such students make up about half of all graduate students in engineering and management at many universities in the United States.

Chinese Diaspora since 1945

While it is the largest of all diaspora communities, the size of the total Chinese population outside China is a matter of some dispute. Estimates of Chinese who live in 140 countries outside the People's Republic of China (PRC) and Taiwan range higher than 60 million. This represents an increase of three to five times during the previous

► THE VIRTUAL DIASPORA

The geographical Chinese diaspora is mirrored in the online world. On the Internet, Web sites of the Chinese diaspora highlight traditional and contemporary concerns. Issues examined on these monolingual, bilingual, and sometimes trilingual Web sites include immigrant Chinese youths, women, families, and clans; social services; political advocacy; newspaper and television journalism; antidiscrimination struggles; preservation of community traditions; history; business networks; philosophy; religion; health; self-cultivation; and the arts. Reflecting the global distribution and local adaptation of the Chinese diaspora in the twenty-first century, languages used on diaspora Web sites include English, Chinese, Tagalog, Bahasa, Japanese, French, Spanish, Portuguese, German, Dutch, Polish, and Hungarian. As with other organizations with an Internet presence, ethnic Chinese individuals and associations sponsoring Web sites may not be fully representative of their communities, but they are making their presence, pride, and contributions more salient.

—*Vincent Kelly Pollard*

70 years. Of these expatriates, 80 percent reside in Southeast Asia, where 7 of the 8 countries with the largest ethnic populations are located. Chinese also reside in North America, the Caribbean, and South America as well as in Europe and Africa. In the South Pacific, 1990's concentrations of Chinese ranged from under 50 in Tonga to 1,000 in New Caledonia to 35,000 in New Zealand. Most Chinese migrants after World War II trace their ancestry to villages, towns, and cities in the PRC, the Hong Kong Special Autonomous Region of the PRC, or the Republic of China on Taiwan. Ancestors of Chinese diaspora came primarily from southern China, where families and large clans have been stronger than elsewhere.

On October 1, 1949, the establishment of the PRC and the flight of the Guomindang (Nationalist Party) from mainland China to Taiwan divided Chinese migrants. Instilling pride in some, it split Chinese communities outside China as their leaders aligned either with Taiwan or Bei-

jing. While social upheavals produced waves of political refugees, impoverished farmers left to find a better life, entrepreneurs sought to acquire wealth, and others sought adventure. During the 1960s and 1970s, loyalties were tested again as governments of countries with Chinese minorities began switching diplomatic recognition from Taipei (Taipei) to Beijing. Capping this trend in 1971, the PRC replaced Taiwan in the United Nations. Later, as Taiwan democratized and held its first three presidential elections (1996, 2000, and 2004) in the face of verbal and military threats from the PRC, divisions reopened in the communities of the Chinese diaspora, especially as migration from Taiwan also continued.

The diaspora reveals a variety of cultural interactions with host countries. The main patterns include selective retention of traditional Chinese customs, adaptation of customs to new localities, changes in host societies, and even political gains for governments in Beijing, Taipei, or both. Current Chinese-language designations for Chinese emigrants and their descendants have a range of political and cultural connotations: *Huaqiao* (Overseas Chinese, that is, Chinese citizens who reside outside China), *Huaren* (ethnic Chinese), and *Huayi* (people of Chinese descent). And for some, the English phrase “Chinese diaspora” seems neutral. By the twenty-first century, a majority of Chinese migrants and their children were still speaking Cantonese, Fujianese, or a newly adopted language at home more often than Putonghua, China's national language.

The stereotype of apolitical Chinese migrants is not a complete picture. Descendants of Chinese migrants have risen to positions of government leadership. In 1988 Corazon Cojuangco Aquino visited her family's ancestral home in Hongjian Village near Zhangzhou City, Fujian Province, in southern China. Other Chinese Filipinos such as Henry Sy, chief executive officer of SM Enterprises, have prospered in the business world. And in the United States, Canada, and Indonesia, Chinese have organized politically to fight against discrimination. In the United States, for example, discrimination against Asian immigrants began to shift in the 1940s as civil rights standards became more inclusive. Under

pressure from a wartime alliance with China in 1943, Congress repealed the Chinese Exclusion Act, the sixth such anti-Chinese statute since 1882. Its repeal facilitated access to citizenship for Chinese residing in the United States. Civil rights legislation in 1964 and 1965 and immigration reforms in 1965 and 1968 also benefited Chinese in the United States. Individual Chinese and Chinese American organizations continued to protest against racial discrimination in the streets and in the courts. Stimulated by this new legal and social milieu, the U.S. Supreme Court decision *Lau v. Nichols* required the State of California to provide bilingual education to Chinese children not yet proficient in English.

Despite variable distances from China, languages spoken, social class, and citizenship, a globally dispersed Chinese diaspora continues to expand and adapt in the twenty-first century.

Immigration to Israel, 1948–2008

The Jewish population in Palestine rose from approximately 50,000 to 600,000 between 1880 and 1948. That figure has risen to over 5 million Jews in Israel as of 2008. Prior to the establishment of the State of Israel, the vast majority of Palestine's Jews arrived in the 1930s following the U.S. decision to curb immigration from Eastern Europe in the 1920s and the rise of Adolf Hitler in Germany in 1933. The rapid increase in Jewish immigration to Palestine during the 1930s was one of the catalysts for the Palestinian revolt against the British and Zionists during

1936–1939 and led to the British introducing the White Paper of 1939, which established specific quotas for Jewish immigration. Jews continued to arrive, many illegally, but it was not until the Jewish State of Israel was proclaimed on May 15, 1948, and subsequently won a decisive military conflict against its Palestinian coinhabitants and its Arab neighbors that Jews were allowed to move to the area en masse. The new State of Israel constituted approximately 78 percent of Mandate Palestine.

Following the 1948 War and the birth of the Palestinian refugee problem—with as many as 700,000 Palestinians displaced—the new State of Israel included approximately 750,000 citizens, of whom 150,000 were non-Jewish Arabs. Of the approximately 600,000 Jewish citizens, about 90 percent claimed European heritage, and 10 percent were from the Islamic world. In terms of its Jewish population, this would be the most European period in Israel's existence, although Israel is often assumed to be a fortress of European Jewry in the Middle East. During Israel's first decade of existence the state opened its doors, sometimes apprehensively, to mass immigration. Between 1948 and 1953 Israel's Jewish population more than doubled, and the proportion of European Jews declined precipitously. While Israel gained approximately 300,000 Jews of European descent, mostly Holocaust survivors, it also gained approximately 300,000 Jews from Asia and Africa, mostly from Arabic-speaking countries who were escaping anti-Jewish sentiment, which in many cases were new developments, from Arab nationalists, many of whom had begun to conflate Zionists and local Jews and were enraged by the plight of the Palestinians and the weakness of their own national armies in relation to Israel's. Thus, by the mid-1950s the non-European Jewish percentage of the Jewish population was nearing 33 percent.

It was also in this period when ethnic labels began to come to the fore in Israel with Jews from the East, which basically meant the Islamic world, being called, for the first time, Mizrahi and Jews from Europe being called Ashkenazi, a term that had long existed. Ironically, many Sephardic Jews, meaning Jews who traced their roots to Islamic Spain and who were not similar culturally to Ashkenazi or Mizrahi Jews, were often

subsumed under the Mizrahi category. Many Mizrahi and Sephardic Jews languished in development towns and transit camps established by the Israeli state, mostly near dangerous borders and away from the urban centers of Tel Aviv and Haifa.

During the late 1950s and 1960s Israel continued to receive tens of thousands of immigrants from the Islamic world, especially in the aftermath of Israel, Britain, and France's attack on Egypt in 1956 and the total Israeli victory in the 1967 War. Islamic nations that had housed significant Jewish populations prior to Israel's existence such as Morocco, Algeria, Yemen, and Tunisia saw these populations dwindle between 1948 and 1970.

After the 1967 War, in which Israel captured the West Bank and the Gaza Strip, thus in some sense reuniting Mandate Palestine, Israel became the occupying power of the majority of the Palestinian people. While Israel did not grant the recently conquered Palestinians citizenship, many Jews, concerned with high birthrates among Palestinian citizens in Israel and fearing future attacks from numerically superior neighbors, began looking for new sources of Jewish immigration. The only parts of the world that housed significant Jewish populations were Western nations such as the United States, Canada, Britain, France, and Argentina, all of whose Jews were integrated and on average were far more well off economically than the average Israeli; as of the 1960s, the Soviet Union's government refused to allow Jews to emigrate to Israel or the West.

In the late 1960s Israeli leaders began to lobby the Soviet Union to ease exit restrictions, a task that was made more difficult after the Soviets cut off diplomatic ties with Israel during the 1967 war. Since Israeli-Soviet relations were at a low, Israeli leaders used their clout with Jewish and pro-Israeli Christian groups in the United States to try to force the Soviet Union to change its policies. Although the Soviets never allowed large-scale emigration, small groups of interested Soviet Jews began to leave their homes for Israel in the 1970s and 1980s. Another minor source of immigration in the 1980s and early 1990s was Ethiopian Jews, whose arrival in Israel was much publicized. Between 1989 and 2000

around 1 million former Soviets migrated to Israel. While Israeli leaders were pleased, the continued high rate of Palestinian births compared to Israeli Jewish births, both inside Israel and in the Occupied Territories, caused many of these leaders to fear for future demographics. In 2004, Prime Minister Ariel Sharon issued a public call for French Jews to move to their "natural homes" in Israel, causing a brief crisis between Israel and France. While no large-scale migration has yet come of this, events such as this indicate Israeli leaders' hope that Western Europe, where anti-Semitism is on the rise, may soon be a source for significant Jewish immigration.

As of 2008 Israel's population is 7.1 million, of whom 5.5 million are Jewish and 1.6 million are either Muslim or Christian. Furthermore, Israel's Jewish population, after the predominantly Ashkenazi Russian migration to Israel, is approximately 50–60 percent Ashkenazi and 40–50 percent Mizrahi/Sephardic, though there has been considerable intermixing in recent years. Israel, which at the times of its creation made up about 4–5 percent of world Jewry, now accounts for more than 40 percent of that total and according to recent statistics now even contains more Jews than the United States. The census for 2000 indicated that the United States was home to 5.2 million Jews, a figure that many scholars have argued is low.

Illegal Immigration, 1945–Present

Illegal immigration is considered among the most important issues of contemporary concern in the United States and Western Europe, causing considerable controversy and debate within

these societies in regard to immigration policies, citizenship, and human rights. The phenomenon of globalization further complicates the issues in regard to global illegal immigration given the immense growth in international economic networks, trade, and labor migration. Furthermore, the need for cheap labor in Western countries may cause many to turn a blind eye to the abuse and exploitation that illegal immigrants suffer in their migration, living, and working conditions, often deprived of any viable civil rights given their unlawful status in another country. Concerns over whether undocumented workers should be granted amnesty, permanent residency, and ultimately citizenship divide both sides of the political spectrum. Debate over whether these workers contribute or usurp jobs from natives or whether they overload state resources or pay into them further complicates the debate.

The United States currently contains a considerable population of undocumented workers, which has led to significant political and economic debates regarding their future legal status. As of 2008, an estimated population of 6 million to 11 million so-called illegal aliens, or undocumented workers, lived in the United States. The social and economic impact of these itinerant immigrants, whether Latin Americans, East Asians, or Middle Easterners, has been a polemic topic of debate. Various conservative organizations, think tanks, and political pundits allege that undocumented immigrants contribute to the growth in crime rates, wage depression, loss of jobs for native unemployed, and millions of dollars wasted in social and educational programs at the local, state, and federal levels. Solutions suggested by these political groups include tougher policing of the hiring of undocumented workers, ensuring tougher border controls, or outright deportations en masse. Immigrant advocacy organizations argue the opposite, that itinerant workers only do the jobs Americans do not want to do, contribute to the expansion of the U.S. economy, and pay far more into the system than they take. Solutions posed by these advocates for immigrants include developing stringent legal immigration policies, collaborating with foreign governments from the immigrants' countries of origin to ensure the economic and social well-

being of potential illegal immigrants, or offering outright blanket amnesty.

Contemporary Europe also contends with public debate over illegal immigration from Africa, the Middle East, and Asia and from nations within the European Union. Countries such as the United Kingdom, the Netherlands, France, Spain, Italy, and Germany have significantly large populations of undocumented workers. Countries with deficient internal controls, such as the United Kingdom, Italy, Spain, and the Netherlands provide easy opportunities for undocumented immigrants to enter the country. However, countries with strict policies regarding immigration such as Germany and Sweden have made illegal immigration nearly impossible. Similarly to the United States, undocumented workers are accused of taking jobs from native unemployed, contributing to rising crime rates, and taking advantage of social programs of the welfare state. They are credited with helping the economic expansion of their host countries and doing the jobs that Europeans do not want to do. Racist discourses and xenophobia often characterize the attacks on illegal workers, evidence of growing intolerance toward the ethnic and religious composition of the immigrant communities.

The perils associated with illegal migration, not to mention the living and working conditions that such migrants are exposed to in their host countries, make the life of an illegal immigrant dangerous, difficult, and often tragic. Migrants to the United States are often smuggled across the Mexican border by so-called coyotes who pack immigrants in the backs of trucks or in the trunks of cars. Such migrants are exposed to theft, abuse, being used as drug mules, and rape on their journey. Undocumented workers from Latin America suffer untold hardships on their way to a better life. Significant numbers have died from exposure and starvation in the deserts of the U.S. Southwest. However, two-fifths of illegal immigrants in the United States were at one time in the country legally but decided to overstay their visas, thereby becoming undocumented.

In Europe some illegal immigrants endure similar hardships while being smuggled across borders, while others take advantage of lax

border controls to enter without too many complications. In Europe and the United States such immigrants acquire work in low-skilled employment for wages far lower than those paid to native workers yet comparatively better than that available in their countries of origin. Frequently they are taken advantage of by their employers due to their lack of civil rights as undocumented aliens. Some of them are forced to work illicitly as prostitutes or as slaves to pay off their debt to the criminal organization that has smuggled them into the country. Others are exposed to work in the horrendous, near slave-like conditions of clandestine sweatshops, exploited through long hours, low pay, and physical abuse.

The debate concerning the position of undocumented workers in both the United States and Europe concerns issues of nationality, citizenship, and human rights. Accusations leveled at undocumented workers range from a disregard for immigration laws to attempts to disrupt the cultural and ethnic makeup and hegemony of the core nationality of the host country. Amnesty and immigrant advocacy groups counter such arguments by dispelling them as racist and bigoted and calling for widespread amnesty and the granting of residency or even citizenship to undocumented immigrants, calling into question the greater issue of what constitutes citizenship and to what extent it depends on birth, ethnicity, or nationality. Questions concerning human rights abuses also enter the debate, as the extent to which host governments tolerate such populations of illegal migrants as economically necessary contributes to their exploitation and position as second-class citizens.

Global Anti-Immigration Movements

The surge in immigration from postcolonial developing countries to the developing world since the end of World War II has increasingly shaped the culture and society of the receiving countries of much of the West. In the immediate postwar period as this occurred, certain segments of the national majority (ranging from racists and nationalists to socialists and labor leaders) saw this trend as a threat to national ethnic identity and secure employment for the indigenous population. While race riots and ethnic tensions, particularly in Western Europe, marked the initial years of immigration, a major economic downturn in the 1970s triggered massive resistance to the continued flow of immigration. From the 1990s until today, restrictive immigration legislation, the abandonment of government-arranged guest worker programs, and increased scrutiny of asylum applications have become tactics to stem the immigrant influx. Anti-immigration movements throughout much of the developed world have sought to protect the domestic labor force from inexpensive immigrant labor and to prevent the alleged draining of the national welfare state by foreigners. These movements are sometimes characterized by racist and xenophobic attitudes.

From 1945 to 1973, guest workers, ex-colonial subjects, and asylum seekers, many of them non-Europeans, were welcome throughout much of Western Europe (particularly in Britain, France, and West Germany), Canada, Australia, and the United States and were seen as beneficial to economic expansion. In addition, asylum seekers (mostly Europeans) from the Soviet-controlled Eastern Bloc were received with open arms in the midst of the Cold War under the conditions set by the United Nations Convention Relating to the Status of Refugees of 1951. From the late 1950s to the mid-1970s, growing problems related to crime and poverty within ethnic enclaves in major European cities (i.e., London, Amsterdam, and West Berlin) increased tensions between immigrant communities and indigenous ethnic nationals. The growing number of asylum seekers from the developing world, no

longer mainly Europeans, also created racial tensions that had previously been associated only with the United States. This led to the growing popularity of nationalist Far Right movements, such as the National Party in Britain, the National Front in France, and multiple neo-Nazi groups in West Germany.

With the end of economic prosperity in the wake of the OPEC oil crisis in 1973, many developed nations immediately created controls on immigration, effectively limiting it to a trickle. Blamed for taking jobs from native workers or for living off the welfare state, immigrants were increasingly marginalized in their new home countries. In the mid- to late 1970s, West European nations placed more restrictive controls on immigration, thereby ending most non-European immigration. Asylum seekers were accepted in smaller numbers, as local nationals threatened violence if higher numbers were taken in at state expense. In the United States, government-arranged Mexican guest worker (*Bracero*) programs were terminated as a result of the actions of agricultural labor unions, such as Cesar Chavez's United Farm Workers (UFW), to prevent wage depression in the late 1960s and early 1970s. These initial reactions resulted in the massive growth of illegal immigration on a global scale, usually operated by international criminal organizations specializing in human smuggling. This widespread problem now plagues much of the developed world from Britain to Japan.

From the 1980s to the present, problems over illegal immigration have resulted in tougher border enforcement and controls, most typically along the U.S.-Mexican border and the states on the extremities of the European Union, making the trek into the developed world much more dangerous and expensive for illegal immigrants seeking work and/or asylum. The existing populations of illegal immigrants within host nations were either readily absorbed through amnesty or readily deported, depending on their legal or economic status. Controversial legislation, such as California's Proposition 187 in 1994 that denied state benefits and education to illegal immigrants, characterized many popular local initiatives that addressed the concerns expressed in larger national debates over immigration.

Debates that pit the rights of refugees against the rights of nationals have made international immigration from the impoverished South to the more affluent North a polemic issue in most developed nations. Groups such as Amnesty International, advocating for the rights of immigrants and asylum seekers, have sought to allow greater numbers of destitute immigrants into receiving nations, while the business sector in much of the developed West, for its own ends (inexpensive labor), has sought the same goals. These pro-immigration factions provoke anti-immigration forces, ranging from racists who blame immigrants for growing urban crime rates to unemployed laborers fearful of losing jobs to immigrants willing to work for less. Political parties of the Center Right, such as the Conservatives in Britain, Republicans in the United States, and Liberals in Australia, typically adopt anti-immigration platforms, albeit on a more moderate scale than that of the Far Right, which typically seizes a more racist or culturally exclusionary agenda.

While xenophobia (fear of foreigners) does characterize many of the anti-immigration movements, economic, social, and cultural concerns also play a part in their widespread appeal. Nationally and regionally based immigration disputes continue, such as those centered on enforcing the use of the national language for immigrants or whether to fund education or medical expenses for undocumented workers and their families. Such disputes also fuel larger debates over the goals of immigration, such as whether a state's goal should be to integrate and assimilate immigrants or establish an often segregated multicultural society. The September 11, 2001, terror attacks in New York and Washington, D.C., and subsequent attacks in Europe added fuel to these debates, particularly when it became apparent that many terrorists come from places such as London, Paris, and Berlin, cities with large segregated Muslim populations.

Immigration Laws

At the turn of the twenty-first century there were about 160 million people in the world living as immigrants, a development that post-1945 immigration laws helped produce. The direction of immigration policy worldwide has undergone several changes since World War II. The effects of these changes are most visible in the realm of international affairs, especially the relations between immigrant-sending and immigrant-receiving nations, and in the domestic political debates in receiving countries over the issue of social cohesion.

While the volume of immigration worldwide reached record levels after World War II, the

basis of immigration policies in receiving countries has generally shifted away from the open door philosophy of indiscriminately admitting migrants toward an ethos of greater selectivity. The two criteria most commonly used to assess the suitability of prospective immigrants have been the contribution they can make to the receiving country's economy and their potential for assimilating into the host society. A third criterion that has become an increasingly prominent component of immigration legislation in numerous countries during the post-1945 era is that of family reunification. In the United States, for example, the Immigration and Nationality Act of 1952 introduced preferences both for family members of U.S. citizens and for skilled migrants. However, one means of selection that has eventually been abandoned by various states is that of excluding migrants on the basis of their race. Although the abolition of the white Australia policy in the 1970s is the most well-known example of this trend, other countries have backtracked from similar racist programs, including Bolivia, Brazil, Canada, El Salvador, Guatemala, Honduras, Mexico, Nicaragua, Panama, the United States, and Uruguay.

A major change in the way that receiving countries have sought to control immigration in the context of an increasingly globalized economic system is their decreasing reliance on unilateral legislative measures in favor of bilateral and, especially in recent years, multilateral inter-governmental agreements. Bilateral arrangements have usually taken the form of treaties between a sending country and a receiving country, the former committing itself to supply the latter with a specific number of temporary workers in return for certain assurances over the treatment of the migrants. For many years this was the principal means of recruiting immigrants that was used by France, whose bilateral agreements with Italy (1946 and 1951), Spain (1961), and Portugal (1963) furnished the bulk of its immigration prior to the 1970s. The Bracero Program, through which Mexico supplied the United States with migrant farm workers on and off between 1942 and 1964, is another example of this device, but it has been utilized at various times by numerous countries, including Argentina, Canada, Costa Rica, Germany, and Japan. Multilateral

► DEMOGRAPHY OF MUSLIM POPULATIONS IN EUROPE

Since 1945 the Muslim population has grown exponentially in various European countries where it had previously been insignificant. Turkey has been a major source of Muslim immigrants to Western Europe, particularly Germany and the Netherlands, where Turks comprised the single-largest immigrant group. Whereas Turkish migration usually occurred under the auspices of bilateral agreements between sending and receiving nations that date back to the early 1960s, the virtually contemporaneous movements of Pakistani and Bangladeshi Muslims to the United Kingdom (UK) originated in the recent colonial relationship between Britain and the immigrants' homelands. Muslim migration from North Africa to France was facilitated by bilateral agreements between the latter and its former colonial possessions of Algeria, Morocco, and Tunisia. By 2003 France had the largest Muslim population in Europe, numbering over 4 million and constituting 7 percent of the country's total population, followed by Germany (3.2 million and 3.4 percent), the UK (almost 2 million and 2.7 percent), and the Netherlands (850,000 and 2 percent).

—Jason McDonald

accords have invariably been outgrowths of the integrated economic systems developing in various continents and subcontinental regions of the world since World War II. For example, freedom of movement for the citizens of member states has been instituted to varying degrees in both the European Union (EU) and the Mercosur countries of Latin America (Argentina, Brazil, Paraguay, Uruguay, and Venezuela).

Prior to the global economic upheavals of the early 1970s, immigration policy was not a particularly prominent or contentious political issue in most receiving countries. However, during the 1980s and 1990s the immigration debate frequently gained center stage in domestic politics, and governments came under increasing pressure to reduce the flow and regulate the composition of immigration. Nowhere did the issue of immigration dominate political debate more than in France and the United States, but it also aroused concern in most EU countries as well as major immigrant-receiving countries in the Middle East, such as Bahrain and Saudi Arabia. While different countries have experienced varying degrees of success in controlling their borders, as a whole the drive to restrict the flow of immigration, particularly that of illegal or undocumented immigration, has met with failure. However, the multilateral approach to reducing illegal immigration adopted by Germany, which in the post-Cold War era used diplomacy to persuade neighboring countries not to act as conduits for illegal migrants, has proved more successful than the U.S. unilateralist policy, as exemplified by the Immigration Reform and Control Act of 1986, even though both states share the same problem of having to regulate entry across extensive land borders with major immigrant-sending countries, these being Poland in the case of Germany and Mexico in the case of the United States.

An important and invariably unanticipated consequence of post-1945 immigration laws has been their wide-ranging impact upon the social and cultural fabric of receiving countries. Legislation permitting increased diversity in the ethnic composition of immigration has in numerous cases transformed previously fairly homogeneous societies into multicultural ones. This has been most noticeable in former colonial powers, such

as the United Kingdom and France, and countries that have recently abandoned ethnic discrimination in their immigration laws, such as Australia and Canada. Moreover, immigration legislation, as well as the naturalization policy to which it was often intrinsically allied, has frequently curtailed the rights of immigrants and thereby contributed both to the latter's marginalization and the overall intensification of economic polarization. South Africa, for instance, has long pursued a policy of preventing migrants from neighboring countries from becoming permanent residents or acquiring full citizenship, while states such as France and the United Kingdom that traditionally had quite liberal naturalization policies began during the 1980s to impose regulations that circumscribed the legal rights of migrants.

Border Controls

Border controls are responses to the fluctuation of population transfers over international borders between neighboring nation-states or population centers. Border crossings might include the efforts of illegal immigrants, asylum seekers, and criminal syndicate drug or human smugglers. Border controls allow an aggrieved nation-state or states to prohibit or restrict the flow of undocumented workers, refugees, and potential enemies of the state. Through the use of the state's military or security services, high-tech equipment and weapons, and prohibitive checkpoints and barriers and by utilizing militarized

► THE WEST BANK WALL—BORDER MILITARIZATION AND THE ISRAELI-PALESTINE CONFLICT

The Arab-Israeli conflict is characterized by the polarization that exists between the Israeli state and the surrounding Palestinian occupied territories, not to mention the divided international opinion regarding actions on the part of both parties. The threat of terrorist attacks within Israel by Palestinian terrorists has led to increased security by the Israel Defense Forces in the form of increased military security of the borders, check points, access roads, and the building of the West Bank Wall (fence). These controversial steps on the part of Israel have raised outrage in the international community that allege that these are steps to reinforce Israeli colonization of the West Bank and Gaza territories, further evidence of the Israeli apartheid state.

Israel began construction of the West Bank Wall in 2002, igniting impassioned debate regarding its ultimate purpose. The Israeli claim that it serves as a security measure to prevent terrorist attacks on its soil is countered by international critics pointing to the significant impact it has over the economic and political rights of Palestinians, depriving them of property, mobility, and government services. The International Court of Justice in The Hague has deemed the wall as illegal. Both sides see their claims as legitimate, further souring international relations between Israel and its Arab neighbors.

—Abraham O. Mendoza

discourses of perceived danger or threat, state agencies can legitimize a fear of the flow of immigrants, foreigners, and refugees in public opinion and operate with impunity regardless of instances of alleged abuse of human rights. While commentators describe how globalization is erasing the old boundaries of nation-states, those borders are nevertheless being taken more seriously than ever.

Debates concerning security across the U.S.-Mexican border are characterized by a political desire to prohibit the entry of undocumented immigrants that conflicts with an economic necessity to allow them in, albeit in small restricted numbers. They are also characterized by the cultural contiguity of the U.S. Southwest and Mex-

ico borderlands and the insatiable need of U.S. economic expansion for cheap labor. The United States faced various labor shortages since World War II well into the 1970s, especially in agricultural labor and low-skilled service employment. This resulted in a series of guest worker programs that allowed Mexican nationals to enter the United States for employment purposes but also attracted illegal immigrants searching for economic opportunities in “el Norte.”

The U.S.-Mexican border, however, is a complicated region historically and demographically. It encompasses a culturally and ethnically contiguous area that is prone to demographic shifts due to economic and political fluctuations in Mexico. In various instances, the United States has removed undocumented workers when economic constraints and public opinion have facilitated this policy. Nativism and xenophobic attitudes toward the cultural and demographic impact that Mexican and other Latin American populations will have on American society have also informed attempts by the U.S. government to prevent the flow of immigrants into the country.

The border controls along the U.S.-Mexican border are characterized by the usage of militarized border guard units (U.S. Border Patrol), a bureaucratic apparatus designed to criminalize and persecute undocumented immigrants (Immigration and Customs Enforcement [ICE], formerly Immigration and Naturalization Service), barriers and fences, high-tech monitoring equipment, low-intensity combat (LIC) tactics and methods to be used as examples for the military services, and discourses of the foreign ‘Other’ as a cultural invader, drug dealer, or terrorist with racist and discriminatory overtones. The U.S. Border Patrol relies on military jargon, for example, calling major actions “operations.” At the same time, the public learns of large-scale actions such as the War on Drugs to further legitimize such actions and shape an image of the Other in the public mind.

After the attacks of September 11, 2001, the Border Patrol and the ICE became part of the Department of Homeland Security, thereby becoming essential services to the ensuing War on Terror. These services also utilize military equipment and hardware such as helicopters, infrared

monitoring equipment, and tracking and sensory devices along the border to detect and apprehend undocumented immigrants. The barriers, fences, lookout posts, and sentry positions illustrate to potential illegals the power that the United States projects. However, the effectiveness of such procedures is in debate, given that the illegal immigrant population in the United States, as of 2007, was estimated to be between 7 million and 11 million people. Critics still denounce U.S. policies pertaining to border enforcement as an example of border militarization.

The European Union (EU) has similar issues in regard to the entrance of illegal immigrants from outside its borders. During the Cold War, large numbers of escapees from Eastern Europe fled to the precursor to the EU, the European Common Community. Many of these were accepted as refugees and granted asylum in various countries, particularly West Germany, which took in an estimated 2.7 million East Germans from 1949 to 1961. The socialist regimes of the Eastern Bloc were adept at restricting the flow of their nationals fleeing abroad. The eventual collapse of the Soviet Union and the dissolution of the communist regimes of Eastern Europe led to an increased amount of people seeking to immigrate to the West due to deteriorating social and economic conditions. Outside of Europe, Africans and Asians unable to enter Europe as refugees seeking asylum underwent different channels, typically relying on organized crime smuggling operations, particularly those based in Russia. The EU's 2004 inclusion of Cyprus, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Malta, Poland, Slovakia, and Slovenia vastly extended the geographic scope and borders of the supranational polity. This created further concerns regarding the protection of the enlarged population and placed new responsibility of enforcement on the so-called New Europe.

Border controls along the boundary of the EU rely on patrols, tracking and monitoring equipment, checkpoints, and extensive scrutiny of individuals and their property at the various entry points and ports. Since the September 11 terrorist attacks on the United States, European authorities have stressed having a strong external security but also having extensive internal security within the various states that comprise

the EU. To ensure a common strategy, joint policies and training for various European border security forces have also been implemented. Cooperation between state police forces, including the linking of various computer databases and information sharing regarding smuggling rings and suspected illegal crossings, have also helped stem the tide of undocumented aliens. Antiforeigner public opinion characterized by fears of terror attacks has ignited support of stringent government enforcement of EU borders to stem the flow of illegal immigration. While the 1985 EU Scheme Agreement allows for the abolition of systematic border controls between the participating countries, it also requires greater vigilance of the external borders of the enlarged EU. This is to prevent the growing amount of illegal immigration stemming from the former Soviet Union, the Middle East, and Africa.

Immigrants' Rights Advocacy, 1945–Present

Immigrants' rights advocacy consists of international organizations, government institutions, nongovernmental organizations (NGOs), and grassroots social movements that work to assist immigrants. Advocates for immigrants' rights include government and United Nations (UN) personnel who assist refugees and asylum seekers, legal aid attorneys who help immigrants navigate the bureaucracy of a particular country when they apply for citizenship or other forms of residency, mental health professionals who

► IMMIGRANTS' RIGHTS ADVOCACY IN ARIZONA

Since the late 1990s, the Sonora Desert in southern Arizona has become the busiest area for illegal immigration in the United States. The increased militarization of the U.S. Border Patrol has narrowed the options for undocumented migrants, leading more migrants to risk harrowing crossings of the desert. Three immigrants' rights groups established between 2000 and 2004 aim to reduce the number of immigrant deaths in the desert. The first group is Humane Borders, which operates and maintains 83 water stations throughout southern Arizona. Each water station has a 200-foot flagpole to alert immigrants that there is water available. The second group, Samaritans, patrols migrant trails and provides water, food, and medical assistance for migrants in distress. The third group is No More Deaths. Like Samaritans, No More Deaths patrols migrant trails but also houses a base camp in Arivaca from which to patrol and operates an aid station in Nogales, Mexico, for deported immigrants returning to Mexico.

—Connie Oxford

work with refugees and torture survivors fleeing violence, and groups that work to ensure the economic and political rights of immigrants on issues such as labor, health care, and racial profiling. Immigrants' rights advocacy exists throughout the world. However, because global migration patterns are structured by a flow away from the global South in areas such as Latin America, Africa, and Asia and toward the global North and areas such as the United States, Canada, and Europe, immigrants' rights advocacy is more prevalent in countries where there are more immigrants.

The largest immigrant advocacy organization in the world that works with refugees, asylum seekers, and internally displaced persons (DPs) is the United Nations Office of the High Commissioner for Refugees (UNHCR). This agency was established on December 14, 1950, and was created to facilitate immigrant advocacy of DPs after World War II. By the end of World War II, many Europeans had been forced into concentration camps, were forcibly removed to other countries in Europe, or voluntarily fled their own

country for another to avoid persecution under the Nazi regime. In the aftermath of the war, the UNHCR worked with immigrants as they made one of three choices. First, some chose repatriation, which is the process of returning to one's home country. Many who had been forcibly evacuated from Germany, for example, decided to return to Germany. Second, some chose to integrate into the societies where they were living. For example, some Poles who had been transported to Germany chose to stay in Germany rather than return to Poland. Third, many chose to resettle in other parts of the world. The two most common destinations for displaced Europeans were Israel and the United States.

The American Jewish Joint Distribution Committee (JDC) was one of the largest organizations that worked with Jewish refugees at the end of World War II. Established in 1914 to assist Jews affected by World War I, the organization assisted European Jews at the end of World War II in DP camps by providing food, medical care, clothing, and schools for children. The JDC financed the resettlement of many Jews to Israel and the United States.

After World War II, the UNHCR continued its work by helping refugees around the world repatriate, integrate into nearby countries, or resettle in countries in the global North. From the 1960s until today, civil wars, independence movements, and natural disasters in Africa and Asia account for more than half of the immigrants in need of help. As of January 2005 there were 19 million people whom the UNHCR identified as at risk. One of the main sources of support that the UNHCR provides for refugees is camps where they receive shelter, food, and medical assistance until they can return home or relocate to another country.

While European immigration after World War II consisted nearly entirely of Europeans displaced within Europe, European immigration since the 1960s has been marked by the movements of Africans and Asians seeking temporary or permanent residence in Europe. The backlash against immigrants in Europe has been so great, particularly in the area of restrictive laws and policies that are anti-immigrant, that the term "Fortress Europe" is often used to describe Europe as an unwelcoming place for immigrants. One form

of discrimination that many immigrants face in Europe is restrictions on work that include the type of work they perform and reduction in salaries. Human rights groups that focus on immigrants' rights advocacy, such as Human Rights Watch and Amnesty International, have brought much attention to the problem of how many European nation-states treat immigrants.

Another contemporary problem that immigrants' rights groups address is racial profiling and violence. For example, many Mexican Americans experience racial profiling because the police and local residents often treat immigrants of Mexican descent as illegal aliens regardless of their citizenship status. In Arizona there are numerous anti-illegal immigration groups, such as the Minutemen Civil Defense Corp (MCDC), that immigrants' rights advocacy groups battle. In April 2005 hundreds of Americans converged in Tombstone, Arizona, to protest illegal immigration across the U.S. southern border. While most immigrants who cross the U.S. southern border are from Mexico, people from Central and South America also pass through this border. Organizations such as Border Action Network and the Human Rights Coalition (Coalición de Derechos Humanos) document human rights abuses and organize neighborhood advocacy groups for those who experience discrimination and violence based on anti-immigrant activism or police brutality.

The last contemporary issue is gender concerns for immigrant women. The most prominent gender issue is the right of female asylum

seekers to claim persecution based on gendered forms of persecution such as domestic violence, rape, female genital mutilation, honor killings, forced sterilization, and forced marriages. Organizations such as the Center for Gender and Refugee Studies, the Refugee Law Center, and the Women's Commission for Refugee Women and Children in the United States assist women seeking asylum for gender-based persecution claims. Other gender issues include women's integration into societies that discriminate against religious and cultural practices, such as immigrant Muslim girls and women wearing headscarves in France in public schools. Organizations such as the French League of Muslim Women have advocated for Muslim women's right to veil and have protested the 2004 French law.

Politics and Statecraft

During the latter years of World War II, the Grand Alliance (primarily Britain, the United States, and the Soviet Union) created a framework for establishing stability in the postwar world at the Yalta, Potsdam, United Nations (Conference on International Organization, San Francisco, June 26, 1945), and Bretton Woods conferences that focused on international cooperation under their leadership. Following the war, international political structures played a far larger role in the foreign policies of the world's major powers in spite of the emergent antagonism between the superpowers known as the Cold War (1947–1991). In the wake of the destruction of European hegemony, the balance of power was now between the United States and the Soviet Union, the two remaining superpowers. Postwar global developments in world politics and statecraft were heavily shaped by the Cold War, decolonization, the creation of new states, the mobilization of human rights groups, and the influence of the two superpowers (the United States and the Soviet Union) as well as a rising power (the People's Republic of China).

During the interwar period (1919–1939), the international body known as the League of Nations, designated with promoting global stability through diplomatic means, proved incapable of deterring aggression mainly owing to the unwillingness of Britain and France to uphold the policy of collective security. The lesson learned by the major world powers from the League of Nations was that international political and economic cooperation could not function without their full backing in terms of military and financial support. This resulted in the creation of the United Nations (1945), established as a beacon of international stability and backed by the United States and the Soviet Union. However, Cold War antagonisms between these superpowers led to the creation of Cold War military alliances between ideological allies. The United States established the North Atlantic Treaty Organization (NATO), the South East Asian Treaty Organization (SEATO), and the Central Treaty Organization (CENTO), in effect surrounding the Soviet Union with U.S. allies and requisite U.S. military bases. The Soviet Union established the Warsaw Pact Organization in response in 1955. Designed to fulfill military and geopolitical purposes, these blocs also fostered regional cooperation and ensured superpower financial support within regions. Other

Postwar global developments in world politics and statecraft were heavily shaped by the Cold War, decolonization, the creation of new states, the mobilization of human rights groups, and the influence of the two superpowers (the United States and the Soviet Union) as well as a rising power (the Peoples' Republic of China).

regional blocs, such as the Arab League, the European Economic Community (European Union after 1991), and, much later, the African Union also nurtured regional cooperation and similar foreign policies. International legal systems and courts such as the International Court of Justice (ICJ) affiliated with the United Nations (UN) or the International Criminal Court (ICC) also began to regulate transnational crimes by states and individuals, following the precedent of the Nuremburg Trials of German leaders and the trials of Japanese war criminals in the Philippines and Japan after World War II. Despite superpower intrusions, individual states utilized these international organizations or regional blocs to advocate their international and national interests.

In the decades following World War II, the process of decolonization created a massive number of new states that entered the world stage as the number of independent countries rose to over 200. While domestic economic considerations played a role in European decolonization, pressure from the superpowers and nationalist resistance were crucial prompting factors. European powers, such as France, Britain, Portugal, and the Netherlands, reluctantly abandoned their empires, sometimes through diplomatic means and at times after armed struggle. The British experience with the partition of India and Pakistan and their abandonment of Mandatory Palestine in the context of the Arab-Israeli conflict illustrate how issues left unsettled by former imperial powers still affect our own times. The French experiences in Indochina (Vietnam, Laos, and Cambodia) and in Algeria made it more amenable to let go of its remaining African empire. The Portuguese (Angola) and the Dutch (Indonesia) had similar experiences with their former holdings. Perhaps the most illustrative example is Belgium's abandonment of the Congo (1960), which still has contemporary implications for the people of that failed state. Nonetheless, the creation of these new states allowed them to enter the United Nations as full members and vote as a sizable bloc against the actions of the major powers that were steadily losing their grip on control of the General Assembly. More recently in the early 1990s, the devolution of the former Soviet Union into independent republics has also created a host of new states across Central Asia, the Caucasus, and Eastern Europe, all of which have been affected by their relationship to Russia in recent years due to large near-abroad Russian populations and Russian ambitions to secure the region as its backyard.

While direct political control over much of the developing world by the European powers subsided during decolonization, accusations of neocolonialism were leveled at the remaining control over economic institutions by former colonial masters, the growing influence of multinational corporations (MNCs), and international bodies such as the World Bank and the International Monetary Fund. States in Asia, Africa, and Latin America found themselves at the whims of the developed world due to the connivance of their governments with these institutions, which determined their national economic development and individual day-to-day survival. British and French interests in their former African colonies, Russian interests in Central Asia and the Caucasus, and U.S. involvement in the Middle East and Latin America showed that

the developing world still depended on the financial and political clout that the West still possessed, regardless of the process of decolonization. Nonetheless, this situation contributed to bitterness against the developed world (widespread anti-Americanism in the case of the United States) in regard to what was deemed an unfair power relations arrangement between the developed North and the developing South.

In spite of the Cold War conflict and its seemingly endless ideological struggle over the hearts and minds of the people of the world, not all people bought into the Manichean rhetoric espoused by the superpowers. The use of torture and the curtailment of civil rights in places such as the Soviet Union, the Eastern Bloc, China, Chile, Argentina, and South Africa were brought to the attention of the world through the actions of various global social movements. Advocates of human rights reported the abuses advocated or tolerated by both camps, basing their movements on common human values rather than sociopolitical ideologies. Global social movements advocating for civil rights, student movements motivated by various issues, or international pressures seeking an end to apartheid in South Africa, the plight of indigenous peoples, and human rights the world over, working from grassroots community organizations that sometimes sought and found international frameworks, managed to affect greater social change on a global scale. Non-governmental organizations (NGOs) such as the International Red Cross and Doctors without Borders (*Médecins Sans Frontières*) sought to bring all people of the world medical assistance during natural disasters and armed conflicts, regardless of their political ideology. Other NGOs, such as Amnesty International and Greenpeace, sought to combat abuses against human rights and the environment, respectively, thus illustrating the power of such groups in mobilizing world public opinion against what were gradually deemed global rather than merely regional or national problems.

In spite of the growing influence of myriad international institutions, NGOs, and newly created states, global politics and international statecraft continued to be dominated by the major superpowers throughout much of the Cold War. Through warfare and diplomacy, both the United States and the Soviet Union engaged in a global battle for the hearts and minds of the world in an ideological battle characterized by the threat of nuclear annihilation. Proxy wars using native groups supported by one or the other superpower fought primarily in developing world battlefields with NATO or Soviet weaponry became a sideshow to the nuclear policy of Mutual Assured Destruction (MAD). By the 1970s, with the widening Sino-Soviet split, the United States sought to use its China card to bring the Soviet Union to the negotiating table, thereby ensuring China with a global role in the coming decades. With the end of the Cold War, the United States found itself in the peculiar situation of being the world's sole superpower, evoking bitterness in much of the world. Nonetheless, with the September 11, 2001, attacks on the World Trade Center by al-Qaeda and the subsequent War on Terror, the Iraq War, and NATO actions in Afghanistan, the United States found itself militarily overstretched on the world stage, much as had Britain at the end of World War II. The recent tenure of the United States as

The relative economic strength of the United States has declined globally with the rise of new economies even as it has continued to be the world's major economic power.

sole superpower appears to be short term, as an economically powerful European Union, a resurgent post-Soviet Russia, and an emergent China, all seeking a world role, suggest the development of a multipolar world to replace the bipolar world of the Cold War. The relative economic

strength of the United States has declined globally with the rise of new economies even as it has continued to be the world's major economic power. With other regions such as Latin America and India seeking their own parts on the global stage, the next century could potentially see a considerable shift in the global balance of power. The outcome of the global economic crisis that began in 2007 continued to create new conditions in the global economy. The economic crisis in 2009 threatened not only tremendous economic changes but also political changes that were likely to be antidemocratic as people sought economic stability and security.

■ Introduction: International Institutions and Laws

International institutions and legal conventions were established after World War II by the victorious Allies to ensure stability in world politics and avoid the failures of the interwar League of Nations, which contributed to the onset of the war that followed. The Grand Alliance (most notably the United States, the Soviet Union, Britain, France, and China) was intent on establishing a new world order based on international principles of law that would prevent the sort of excesses committed under the Third Reich and in the Greater Japanese Co-Prosperity Sphere. Notable achievements include the Nuremberg Trials (1945–1946) of war criminals, creating viable international legal precedents for such prosecutions, and the establishment of the United Nations (1945), which provided a forum for cooperation among the world's nations.

In spite of the implementation of these institutions and legal frameworks for international relations, Cold War antagonisms and the large-scale decolonization that followed the war complicated international cooperation. As a result, the postwar period was also characterized by the development of large intercontinental defensive

alliances (such as NATO and the Warsaw Pact Organization) based on ideological affiliation. In addition, during this period regional cooperative alliances developed such as the African Union and the Arab League to assist the economic and military needs of vast regions of the decolonized world and prevent future European exploitation.

Despite the expansion of postwar notions of international law and the associated institutions to prevent war crimes and crimes against humanity, on par with those committed during World War II, in recent decades genocide and mass rape have continued unabated in areas of the developing world due to neglect and indifference on the part of the developed world.

—Abraham O. Mendoza

United Nations

The United Nations (UN) emerged from World War II when the victorious Grand Alliance established it as the successor organization to the League of Nations because they were determined to prevent another world war and to eliminate the scourge of war around the world if possible.

The founders of the UN carefully studied why the League of Nations had failed. They sought ways to make the new institution a permanent player in global affairs. President Franklin D. Roosevelt first used the term “United Nations” on January 1, 1942, in the “Declaration by United Nations.” The declaration was a pledge by 26 nations to battle the Axis powers until they were defeated.

The UN was designed to ensure global security and to be a forum among nations on issues of peace, justice, development, and economics. The latter issue was addressed at Bretton Woods, New Hampshire, in 1944 with the Bretton Woods Agreement, which created several economic institutions, including the World Bank and the International Monetary Fund (IMF). Justice in resolving disputes among nations was centered in the International Court of Justice, which is also known as the World Court and which has its seat in The Hague.

Seeking to avoid problems that had arisen with the creation of the League of Nations, the UN was developed separately from the peace treaties that ended World War II. The UN’s framers created two major institutions: the Security Council and the General Assembly. Every member state became a participant of the General Assembly with one vote regardless of population or wealth. The Security Council was created with five permanent members. These were the major victorious warring powers against the Axis: China, France, Britain, the Soviet Union, and the United States. Each of the five has a veto that can nullify any action being sought by the other members of the Security Council. In addition, there were originally six nonpermanent member states. This number was eventually expanded to ten nonpermanent members that serve staggered terms in which five rotate off after two years.

With the onset of the Cold War, each UN secretary general has had to negotiate the ideological struggle between the United States and the (former) Soviet Union and their spheres of influence. In addition, as decolonization accelerated in the postwar period, many developing countries that were former colonies joined the UN. These countries entered the politics of the UN less with an interest in the ideological struggle than with economic development.

Major issues faced by the UN include peacekeeping missions, which have included operations such as the Korean War (1950–1953), and interventions in the Congo, the Balkans, and other world regions. In addition, the UN, often through the offices of the secretary general, has been a player in enacting a cessation of hostilities between countries such as the end of two regional wars between India and Pakistan. Since the end of the Cold War, numerous threats to regional and global peace have occurred, such as ethnic cleansing in the former Yugoslavia, the war in Iraq, and other issues of global security. The UN has been involved in more than 50 peacekeeping operations in its entire history. However, these operations have in some cases neither preserved peace nor saved the lives of innocent victims of conflicts. In some cases, such as the genocide in Rwanda or the launching of rocket attacks on Israel by Hizbullah from its bases in southern Lebanon, UN peacekeepers merely observed the slaughter. Of major concern by 2008 were the issues of nuclear weapons proliferation, especially by Iran, and the advent of global terrorist activities.

Due to the enormous growth in the world’s population and the billions of people who still live in poverty, many UN programs have been instituted to reduce poverty. Along with poverty has been a growth in initiatives intended to address global warming and other major environmental problems.

Despite opposition, UN supporters note that there has not been another world war since the creation of the UN. In addition, despite internal criticism of the UN in the United States, the U.S. State Department has found it to be a relatively inexpensive and useful tool for the conduct of diplomacy.

NATO, SEATO, and CENTO

In the years following World War II, as nations throughout the world began to pick sides in the emergent Cold War, new alignments and alliances came into play. The North Atlantic Treaty Organization (NATO), the Southeast Asian Treaty Organization (SEATO), and the Central Treaty Organization (CENTO) were developed under American and British auspices to contain the ideological and military advance of the Soviet Union in various regions surrounding the so-called second world of socialism. While NATO has been able to survive well past the fall of the Soviet

Union and play a significant role in recent events in Yugoslavia and Afghanistan, the other two alignments failed to survive beyond the 1970s.

NATO is a mutual defense alliance of West European and North American nations originally formed in the first years of the Cold War to protect member nations from potential aggression from the Soviet Union and its East European satellites. The original signatories to NATO were the United States, Britain, France, Belgium, the Netherlands, Luxembourg, Canada, Denmark, Iceland, Italy, Norway, and Portugal in 1949. In 1950 U.S. general Dwight D. Eisenhower was appointed as the first supreme allied commander of NATO. The addition of West Germany (Federal Republic of Germany) into NATO in 1955 led to the formation of the rival Warsaw Treaty Organization, commonly known as the Warsaw Pact, an alliance between the Soviet Union and its satellites. NATO membership expanded in 1952 to include Greece and Turkey. Spain belatedly joined in 1982.

In spite of the major differences between the United States and its European allies, NATO has survived well past the end of the Cold War and continues to be a major player in global foreign policy. In the late 1940s, due to the shattered state of Western Europe, the United States took the mantle of leadership in the alliance. However, as European nations slowly recovered, some of their leaders demanded some degree of sovereignty in foreign affairs within an alliance they saw as manipulated by American interests. As a case in point, in the 1960s French president Charles de Gaulle strongly advocated against military integration of French units into NATO, ultimately withdrawing them from its command and demanding that NATO troops leave French territory. Disagreements over troop levels, disarmament, increased military budgets amid recessions, and the stronger foreign policy stance against the Soviet Union embraced by the United States in the 1970s and 1980s further exacerbated such conflicts within NATO. The fall of the Berlin Wall in 1989 and the collapse of the Soviet Union in 1991 led some critics to predict the end of NATO as the threat of global communism rapidly eroded. However, NATO has continued to play an active role in world affairs, most recently against Serbia in Yugoslavia in the

➤ AUSTRALIA, NEW ZEALAND, UNITED STATES SECURITY TREATY (ANZUS)

The Australia, New Zealand, United States Security Treaty (ANZUS) Treaty was a treaty for mutual defense signed by Australia, New Zealand, and the United States on September 1, 1951. It is specifically named after the initial letters of the member states. Its intention was the creation of a military alliance between Western powers in the Western Pacific region for mutual defense in response to potential aggression from communist regimes. This treaty was one of several alliance systems (including NATO, SEATO, and CENTO) that the United States created in various world regions to ensure the global containment of communism.

Currently, ANZUS functions as a military alliance that binds Australia and New Zealand and, separately, Australia and the United States to cooperate on defense issues in the Pacific region. This is due to the New Zealand 1985 ban on ships with nuclear capabilities in its ports, effectively preventing American naval ships from entering New Zealand's waters if suspected of carrying nuclear weapons. As U.S. authorities would neither confirm nor deny carrying such weapons, this blocked all U.S. naval ships from New Zealand. This led the United States to suspend its ANZUS obligations to New Zealand in protest. However, in recent years the United States still has bilateral agreements with Australia, ensuring that their alliance is intact and has had success in reconciliation efforts with New Zealand.

—Abraham O. Mendoza

NATO MEMBER COUNTRIES

1990s and against al-Qaeda and Taliban fighters in Afghanistan from 2001 to the present. It has also admitted former members of the Warsaw Pact as allies, including the Czech Republic, Hungary, and Poland in 1999 and Estonia, Latvia, Lithuania, Bulgaria, Romania, Slovakia, and Slovenia in 2004.

SEATO was the collective security arrangement for Southeast Asia arranged under American auspices and designed to prevent the spread of communism in that region. SEATO was created by the Pact of Manila of September 8, 1954, signed by the United States, Britain, France, Australia, New Zealand, the Philippines, Thailand, and Pakistan. SEATO differed from NATO in that it did not implement a multilateral defense system and emphasized the containment of communism from spreading into the region. The SEATO agreement contained a special protocol that demarcated Laos, Cambodia, and South Vietnam as countries that if infiltrated by communism could pose a danger to signatory nations. SEATO members were expected to meet and confer in order to send troops or act in unison, and unlike NATO an attack on one signatory nation did not imply an attack on all. The protocol for Southeast Asian containment provided the United States with the sanctions necessary to defend South Vietnam and engage North Vietnam militarily. Having outlived its usefulness, SEATO expired, officially dissolving in Bangkok on June 30, 1977.

CENTO was a U.S.-led alliance specifically intended to prevent the expansion of Soviet influence in the Middle East. CENTO developed from the Baghdad Pact that Britain created in 1955, along with Turkey, Iraq, Iran, and Pakistan, and was aimed at preventing Soviet expansion into the Middle East. As British influence declined in the region in the wake of the Suez Crisis (1956) and the 1959 overthrow of the Iraqi government friendly to British interests, the Baghdad Pact was transformed into CENTO under American leadership. The United States signed defense treaties with Iran, Turkey, and Pakistan in Ankara in 1959, thereby creating CENTO. The specific purpose of CENTO was to protect the Middle East against outside aggression (primarily Soviet expansion, much like NATO and SEATO) and to advocate economic and scientific cooperation between the

signatory nations. Despite CENTO efforts to the contrary, the Soviet Union was able to influence the region through diplomatic overtures and the sale of weapons. Little effort was made to promote economic and scientific cooperation between CENTO members. The United States proved unable to maintain the alliance. In 1974 Britain reduced its commitment, withdrawing its forces to Cyprus. U.S. aid to Iran, both economic and military, was unable to prop up its pro-Western government. CENTO was officially dissolved as Iran withdrew following the Iranian Revolution of 1979. Pakistan and Turkey maintained their relationship with the United States through other treaties.

Warsaw Pact

On May 14, 1955, the Soviet Union, Albania, Bulgaria, Romania, the German Democratic Republic (GDR), Hungary, Poland, and Czechoslovakia signed a multilateral Treaty of Friendship, Cooperation, and Mutual Assistance in Warsaw, also known as the Warsaw Pact, that established the Warsaw Treaty Organization (WTO). Member states pledged to defend each other if one or more of the members were attacked. The immediate trigger for the creation of the Warsaw Pact was the admission of the Federal Republic of Germany (FRG) into the North Atlantic Treaty Organization (NATO) and the Austrian State Treaty, which provided for Austrian neutrality and the withdrawal of Soviet troops. With the latter, the Soviet Union made it clear to its satellite states that Austria's neutral status would not likewise be granted to them. In addition, Nikita

► THE 1964 WARSAW PACT WAR PLAN

The Warsaw Pact War Plan of October 14, 1964, for the Czechoslovak front is the only actual war plan of both the North Atlantic Treaty Organization (NATO) and the Warsaw Pact (WTO) that has thus far surfaced. Others have either not been declassified or have been destroyed. Discovered in February 2000 by Czech historian Petr Lunak in the Prague military archives, the war plan describes the Czechoslovak army's role within the general operations of Soviet and other WTO armies in case of a European war. The plan shows the considerable degree to which the Soviets had to rely on the Czechoslovaks because of the location of their country and the absence of permanently stationed Soviet troops on their territory.

Prepared by the Soviet General Staff, the war plan describes the first week of an attack of the Czechoslovak front on enemy territory. It assumes an initial NATO strike quickly repulsed with a Soviet-led offensive into Western Europe and the routine use of nuclear weapons by both sides. As many as 131 nuclear missiles and bombs were to be delivered in a first nuclear strike. The offensive should be concentrated in the direction of Nuremberg, Stuttgart, Strasbourg, Epinal, and Dijon. By the seventh or eighth day of the attack, the troops of the Czechoslovak front were supposed to reach the cities of Dijon and Besancon in eastern France and be ready to advance southward toward Lyon.

—*Christian Nuenlist*

Khrushchev presented the West with a standing offer to disband the Warsaw Pact simultaneously with NATO, contingent upon East-West agreement on a new collective security system in Europe. The Political Consultative Committee (PCC) was established as the alliance's highest governing body, consisting of the member states' party leaders. On the military side, a unified command and a joint staff were created to organize the actual defense of the WTO states.

In its early years, the Warsaw Pact served primarily as a Soviet propaganda tool in East-West diplomacy. Khrushchev used the PCC to publicize his disarmament, disengagement, and peace offensives and to accord them a multi-lateral umbrella. The first concrete military step

taken was the admission of the East German military into the unified command, but not until the Berlin Crisis (1958–1961) was there a systematic militarization of the WTO. The Soviet General Staff and the Warsaw Pact unified command prepared East European forces for a possible military conflict in Central Europe. In 1961, the Soviets replaced the old defensive strategy with an offensive strategy that provided for a deep thrust into Western Europe. The WTO began to conduct joint military exercises to prepare for fighting a nuclear war in Europe. Despite the policies of *détente* (*rapprochement* between East and West), preparations for a deep offensive push into Western Europe accelerated and intensified during numerous joint WTO military exercises in the 1970s. The offensive strategy remained in place until 1987.

Behind the facade of unity, growing differences troubled the Eastern alliance. Following Khrushchev's campaign of de-Stalinization, in the fall of 1956 Poles and Hungarians demanded a reform of the Warsaw Pact to reduce Soviet dominance within the WTO. Polish generals issued a memorandum that proposed modeling the Warsaw Pact more after NATO, while Hungary's new Communist Party leader, Imre Nagy, declared his country's neutrality and its plans to leave the Warsaw Pact. In November 1956, the Soviet Army invaded Hungary and eliminated all resistance. In 1958, Romania demanded the withdrawal from its territory of all Soviet troops and military advisers. To cover Soviet embarrassment, Khrushchev termed this a unilateral troop reduction contributing to greater European security. At the height of the Berlin Crisis, Albania stopped supporting the pact and formally withdrew from the alliance in 1968. The WTO was not consulted when Khrushchev provoked the October 1962 Cuban Missile Crisis. Only after the crisis was ended did East European leaders learn in a secret meeting that a nuclear war had been narrowly avoided. Romania reacted promptly. In 1963, the Romanian government gave secret assurances to the United States that it would remain neutral in the event of a nuclear confrontation between the superpowers.

In early 1966, Soviet general secretary Leonid Brezhnev proposed a Soviet plan to reform and institutionalize the Warsaw Pact. However,

resistance by Moscow's allies prevented the implementation of his scheme. While the Soviet Union tried to intimidate the Czechoslovak government with multilateral WTO military maneuvers in 1968, the invading forces sent in on August 20, 1968, were mostly from the Soviet Union with token Polish, Hungarian, and GDR contingents but no Romanian troops. Romania denounced the invasion as a violation of international law and demanded the withdrawal of all Soviet troops and military advisers from its territory. It also refused to allow Soviet forces to conduct exercises in its territory.

The consolidation that resulted from the PCC session in Budapest in March 1969 transformed the WTO into a more consultative organization. It established a committee of defense ministers, a military council, and a committee on technology. With these three new joint bodies, the WTO finally became a genuine multilateral military alliance. In 1976, previous informal gatherings of the Warsaw Pact foreign ministers were institutionalized into a committee of ministers of foreign affairs. In the 1970s, consultations within Warsaw Pact bodies primarily dealt with the Conference on Security and Cooperation in Europe (CSCE). From 1980 to 1981, the Solidarity Crisis in Poland heralded the end of Moscow's domination of Eastern Europe. However, it did not pose a serious threat to the WTO's integrity. To avoid the high political costs of military intervention, Moscow trusted that the loyal Polish military would suppress the opposition on its own initiative. The imposition of martial law by General Wojciech Jaruzelski was a major success for Moscow, as it demonstrated that the Polish generals loyal to Moscow were protecting the interests of the WTO against their own people's desires.

During the intensified Cold War of the 1980s, internal disputes in the WTO increased. Romania demanded cuts in nuclear and conventional forces as well as in national defense budgets. It also called for the dissolution of both Cold War alliances and for the withdrawal of both U.S. and Soviet forces from Europe. The issue of an appropriate WTO response to NATO's 1983 deployment of U.S. Pershing II and cruise missiles in Western Europe, matching Soviet SS-20 intermediate-range ballistic missiles aimed at West European targets,

The Council of Ministers Palace in Warsaw, during the Warsaw Pact Political Committee talks, 1965. (Eastphoto, NYC/Library of Congress)

proved to be most divisive for the WTO. At the time of the Warsaw Pact's 30th anniversary in 1985, Mikhail Gorbachev became the new Soviet leader and intensified the role of Warsaw Pact consultations to determine the desired nuclear and conventional cuts in the Eastern alliance. After the fall of the Berlin Wall in 1989, East and West at first saw merit in keeping both Cold War alliances in place. In January and February 1991, however, Czechoslovakia, Hungary, Poland, and Bulgaria declared that they would withdraw all support by July 1 of that year. The Warsaw Pact came to an end on March 31, 1991, and was officially dissolved at a meeting in Prague on July 1, 1991.

The African Union

The African Union (AU), formerly the Organization of African Unity (OAU), was founded in Durban, South Africa, in July 2002. After reorganization and relaunching, the AU replaced both the African Economic Community, an organization of regional trading groups, and the OAU itself. Founded in 1963 in Addis Ababa, Ethiopia, where the AU Secretariat resides, the OAU concentrated for 39 years on freeing Africa of Western colonialism. Its powerlessness generally reduced OAU leaders to appeals for sympathy to help end violations of members' sovereign rights. Since Africa's last colony, Namibia, won independence from apartheid South Africa in 1990, the OAU/AU has taken up continental problems such as AIDS and regional conflicts, for which without its own peacekeeping forces the AU is singularly ill-prepared.

Initially the OAU was divided into two camps, a more conservative Monrovia group (named for Liberia's capital) and a Ghana-Guinea group that expressed the Pan-African radicalism of worldwide African diasporas. The Monrovia group triumphed in OAU councils over Kwame Nkrumah's Ghana and its Pan-Africanist allies, who upheld utopian ideals of a United States of Africa, still a distant prospect. Naturally, intra-African tensions have grown despite Pan-Africanist ambitions since colonialism ended. Morocco, for example, reasserted historical claims to the Western Sahara against the wishes of its indigenous peoples and Algeria, as Spain in 1975 withdrew from its ex-colony.

One of Africa's 54 states, Morocco is currently not a full AU member, owing to its expansionist ambitions in a Saharan region that Algeria and the AU call the Sahrawi Arab Democratic Republic (SADR). In 1975 Morocco invaded the ex-Spanish Sahara, thereby challenging a central OAU principle: the inviolable nature of colonial boundaries, maintained as an antidote to irredentist conflict. Once Western powers withdrew, African successor states inherited borders that colonists had drawn up with scant regard to local realities. Consequently, at the OAU's 1963 founding meeting, African leaders decided that all ex-colonial boundaries must be respected, lest people across international borders of com-

mon culture provoked interneighbor conflicts (irredentism). Except for Liberia and Ethiopia, all African states were colonial creations. Ethiopia nonetheless fought to retain today's Eritrea as part of its national territory and fought an independent Eritrea in the late 1990s.

Almost 40 years later it is clear that political instability, though a serious complication, has not been Africa's only difficulty. By the late 1990s the OAU was widely derided, especially in Africa, as a dictator's club. In recently democratized South Africa, the 2002 Durban Conference promoted peer review as a process by which AU members could counsel errant governments about internal affairs. Currently (2009) Mauritania is suspended, while Togo succumbed to AU pressure to hold presidential elections in which Faure Gnassingbe succeeded his father Gnassingbe Eyadema. A current AU priority is its peace monitoring force in Darfur, Sudan. This may be increased in number, but a continental agreement and Western logistical support will be essential, with the Sudanese government only reluctantly accepting AU soldiers in preference to United Nations soldiers.

As its rotating president, Sudanese leader Omar al-Bashir is due to lead the AU, but this embarrassment is currently on hold while the organization's executive defers Sudan's presidency. The AU executive, a gathering of presidents, prime ministers, and other African leaders, is known as the Assembly of Heads of State. There is also a Pan-African Parliament based in Midrand, Johannesburg, South Africa, representing African people, not just governments. This last is a reform of OAU structures. An ultimate AU goal is a common market building on existing regional trading groups, a common currency, and a single integrated defense force. Reflecting its Pan-African origins, the AU professes an interest in all peoples of African descent globally. It has defined the diaspora as consisting of people of African origin living outside the continent, irrespective of their citizenship and nationality, who are willing to contribute to the development of the continent and the building of the AU.

At the 2002 founding AU conference, South African president Thabo Mbeki promoted a New Partnership for Africa's Development (NEPAD). South Africa's continental leadership is almost

inevitable, given its preeminent economic status: it produces 40 percent of Africa's electricity and dominates continental extractive (De Beers), communications (MNET), and manufacturing (South African Breweries) industries. South Africa is a midrange economic power comparable to Brazil or Indonesia. South African Breweries, for instance, owns American-based Miller Brewing Company. However, old-style African leaders such as Zimbabwe's Robert Mugabe have tarnished NEPAD's image. President Mugabe has clung to power regardless of his people's democratic will, well-being, or human rights. NEPAD is intended to secure outside support in return for transparent democratic reforms to which Mugabe is belligerently opposed, preferring to excuse all government excesses with paranoia about supposed Western manipulation of local opponents.

Mugabe aside, the AU is committed to addressing Africa's health, environmental, and economic problems. Of these, HIV/AIDS is the most significant health issue. Inhabited by 10 percent of the world's population, Africa is estimated to have 60 percent of the world's HIV and AIDs sufferers. As with much else on the continent, responses to this challenge have not been without controversy, ranging over the causes, origins, nature, and extent of HIV/AIDs. Environmentally, desertification and global warming are also priorities. The provision of continent-wide clean water would be a major and, with outside assistance, not prohibitively expensive boon. If the AU Secretariat could establish itself as an authoritative source of information on Africa's socioeconomic difficulties, this too would be a step forward. Undoubtedly, the AU has much to achieve.

However, its representatives did play a significant role in the 2005 Gleneagles G-8 summit that saw Western governments forgive much African external debt. Certainly, the AU could provide a significant body for coordinating its members' responses to common challenges as well as serving as a clearinghouse to prioritize outside aid projects. The organization might in the foreseeable future take a number of steps toward its goal of a common currency and a common market. In pursuit of stability, AU coordination of local defense forces on a continent-

wide basis would, with outside logistics, be an immediate benefit.

Arab League

The Arab League, also called the League of Arab States, is a voluntary organization of Arabic-speaking nations. It was founded at the end of World War II with the stated purposes of improving conditions in Arab countries, liberating Arab states still under foreign domination, and preventing the formation of a Jewish state in Palestine.

In 1943 the Egyptian government proposed an organization of Arab states that would facilitate closer relations between the nations without forcing any of them to lose self-rule. Each member would remain a sovereign state, and the organization would not be a union, a federation, or any other sovereign structure. The British government supported this idea in hopes of securing the Arab nations as allies in the war against Germany.

In 1944 representatives from Egypt, Iraq, Lebanon, Yemen, and Saudi Arabia met in Alexandria, Egypt, and agreed to form a federation. The Arab League was officially founded on March 22, 1945, in Cairo. The founding states were Egypt, Iraq, Lebanon, Saudi Arabia, Transjordan, and Syria. Subsequent members include Libya (1953), Sudan (1956), Tunisia (1958), Morocco (1958), Kuwait (1961), Algeria (1962), South Yemen (1967, now Yemen), Bahrain (1971), Oman (1971), Qatar (1971), the United Arab Emirates (1971), Mauritania (1973), Somalia (1974), Djibouti (1977), and Comoros (1993).

► THE ORGANIZATION OF THE ISLAMIC CONFERENCE

Founded in 1969, The Organization of the Islamic Conference (OIC) is an intergovernmental grouping of 57 nations with substantial Islamic populations, primarily located in the Middle East, Africa, South-east Asia, and South Asia. The primary objective of the OIC is the unity, promotion, and protection of the interests of the Islamic peoples (Umma) of these member countries. The organization's strength stems from its representation of nearly 1.4 billion Muslims, a Permanent Delegation to the United Nations, active support and participation by the heads of state of these various nations, and its support from the organization's wealthy oil-rich countries. According to some of its critics, this Muslim organization suffers from divisions, uncertainty on policy matters, and public relations problems that stem from members of the Islamic community who besmirch the reputation of Islam by reliance on terrorism.

The OIC formed in Rabat, Morocco, on September 25, 1969, in response to fire damage caused by extremists to the al-Aqsa Mosque in Jerusalem. The subsequent meetings of the OIC emphasized not only the promotion and the coordination of scientific, cultural, and economic efforts of its members but also repudiation of Western imperialism, Zionism, and retrogressive attitudes such as defeatism, pessimism, and religious conservatism, an overly meticulous and counterproductive interpretation of the Quran that rejects modernity and change. The OIC firmly supports the rights of the Palestinian people but remains divided on the issue of the recognition of Israel.

The original goals of the Arab League were to liberate all Arab nations still ruled by foreign countries and to prevent the creation of a Jewish state in Palestine as well as to serve the common good, improve living conditions, and guarantee the hopes of member states. In 1946 the league members added to their pact a cultural treaty under which they agreed to exchange professors, teachers, students, and scholars to disseminate Arab culture to their citizens.

The Arab League's pact also stated that all members would collectively represent the Palestinians so long as Palestine was not an independent state. With no Palestinian leader in 1945, the Arab states feared that the British would dominate the area and that Jews would colonize part of Palestine. In response to these fears, the Arab League created the Arab Higher Committee to govern Palestinian Arabs in 1945. This committee was replaced by the Arab Higher Executive in 1946, which became the Arab Higher Committee in 1947.

The State of Israel was declared on May 14, 1948. The next day Egypt, Iraq, Lebanon, Saudi Arabia, Syria, and Transjordan responded with a declaration of war on Israel. Yemen also supported the declaration. Secretary General Abdul Razek Azzam Pasha declared that the Arab League's goal was to conduct a large-scale massacre and extermination. Although King Abdullah of Jordan (he officially changed the name of Transjordan to Jordan in April 1949) claimed to be the legitimate power in Palestine, the league did not wish to see Jordan in control of the area and thus established its own government on behalf of the Palestinians, the All-Palestine State of October 1, 1948. The mufti of Jerusalem, Haj Amin Husseini, was its leader, and Jerusalem was its capital. Although ostensibly the new government ruled Gaza, Egypt was the real authority there. In response, Jordan formed a rival temporary government, the First Palestinian Congress, that condemned the government in Gaza. The Arab-Israeli War ended in 1949 with Israel intact. Jordan occupied the West Bank and East Jerusalem, and Egypt controlled Gaza.

During the 1950s Egypt effectively led the Arab League. In 1952 a military coup in Egypt, nominally headed by General Muhammad Naguib, overthrew King Farouk, but within two

years Colonel Gamal Abdel Nasser assumed control. A strong proponent of Arab unity, he called for a union of all Arab nations, including Palestine. Nasser ended the All-Palestine government in Palestine, formed the United Arab Republic with Syria, and called for the defeat of Israel.

In 1956 Nasser nationalized the Suez Canal, precipitating the so-called Suez Crisis that brought an Israeli invasion of the Sinai followed by British and French short-lived invasions of Egypt. U.S. economic and political pressure secured the withdrawal of the invaders. Far from toppling Nasser as the allied British, French, and Israeli governments had hoped, the failed invasions strengthened Nasser's prestige in the Arab world and raised the stature of Pan-Arabism and the Arab League.

In the 1960s the Arab League again pushed for the liberation of Palestine, and in 1964 it supported the creation of the Palestinian Liberation Organization (PLO), which was dedicated to attacks on Israel. Following the Six-Day War of 1967, which ended in extensive territory losses for Egypt, Jordan, and Syria to Israel, the Arab League met at Khartoum that August and issued a statement in which its members vowed not to recognize, negotiate with, or conclude a peace agreement with Israel. The Arab League suspended Egypt in 1979 in the wake of President Anwar Sadat's visit to Jerusalem and participation in the 1978 Camp David Peace Accords. The league also moved its headquarters from Cairo to Tunis. When the PLO declared an independent State of Palestine on November 15, 1988, the Arab League immediately recognized it. Egypt was readmitted to the league in 1989, and the headquarters returned to Cairo. In the 1990s the Arab League continued its efforts to resolve the Israeli-Palestinian dispute in Palestine's favor.

More recently, in 2003 the Arab League voted to demand the unconditional removal of U.S. and British troops from Iraq. The lone dissenting voice was the tiny nation of Kuwait, which had been liberated by a U.S.-led coalition in the 1991 Persian Gulf War.

Group of Eight (G8)

The Group of Eight (G8) is an association of eight nations (formerly seven) that meets to discuss a range of global issues, particularly those relating to international economic and diplomatic concerns. Its membership includes the United States, Britain, France, Germany, Japan, Italy, Canada, a significant cross-section representative of the developed nations of the world, with the addition of Russia in 1997. The G8 serves as a means for the member nations to cooperatively establish economic and political stances that affect billions of the world's people. As a result, antiglobalization activists and intellectuals frequently make the G8 a target of criticism. Since the 1970s, the G8 organization (known as the G7 before the inclusion of Russia) has come under incessant criticism for failing to solve the economic problems of developing nations and allegedly focusing on seeking global economic hegemony for its member nations.

Antiglobalist demonstrators march with posters bearing the likenesses of G8 leaders during protests against the G8 Summit in Toyako, Japan, July 7–9, 2008. From left to right: U.S. president George W. Bush, Prime Minister Silvio Berlusconi of Italy, Prime Minister Yasuo Fukuda of Japan, Prime Minister Stephen Harper of Canada, and President Nicolas Sarkozy of France. (Mujitra)

➤ ASIA-PACIFIC ECONOMIC COOPERATION (APEC)

The Asia-Pacific Economic Cooperation (APEC) is a forum for an association of 21 Pacific Rim countries for the purpose of discussing economic issues concerning cooperation, trade, and investment within the greater region. The first meeting of APEC resulted from Australian prime minister Robert Hawke's requests for more effective economic cooperation within the Pacific Rim region in 1989. The first meeting took place in Canberra, Australia, in November of that year and was attended by representative delegates rather than heads of state. The first meeting of APEC Economic Leaders, composed of the heads of states of member nations, took place in 1994.

Among the various activities coordinated by the APEC Secretariat are year-round meetings of the member states' representatives and the APEC Economic Leaders Meeting, an annual summit attended by the heads of state of all APEC members except Taiwan (Republic of China), which is represented by a delegate. The location of the summit rotates annually among the member economies, and a noted tradition involves the attending leaders dressing in the national costume of the host member nation. The current members of APEC include the United States, Russia, Australia, New Zealand, Japan, Canada, Indonesia, Malaysia, South Korea (Republic of Korea), Singapore, Thailand, Taiwan (Republic of China), China (People's Republic of China, or PRC), Hong Kong (separate from the PRC), Mexico, Papua New Guinea, Chile, Peru, Brunei, the Philippines, and Vietnam.

—*Abraham O. Mendoza*

The idea for a summit to discuss pressing economic concerns gained importance in the wake of the Organization of Petroleum Exporting Countries (OPEC) Oil Crisis of 1973, when most of Western Europe and the United States regarded cooperation and consultation pivotal in addressing solutions to their domestic economic difficulties. The rising price of oil ignited by the formation of OPEC and its impact on the oil-dependent developed world caused severe financial strains. In 1973 U.S. treasury secretary George Shultz organized a major conference of

financial consultants from Britain, France, Japan, and West Germany, known informally as the Library Group. By the following year, both France and West Germany advocated making the summit into a conference, with the heads of state of the member countries as main representatives. By 1975 the first official G6 meeting took place in Rambouillet, France, and was hosted by French president Valéry Giscard d'Estaing. The following year, Canada joined the fore, making the 1976 summit in Puerto Rico the first for the G-7. The subsequent year, the European Union (EU) was accorded observer status at the London summit, having been invited as such by the British government.

The initial summits of the 1970s addressed policies espoused by the World Bank and the International Monetary Fund and specific problems related to global inflation. However, in the early 1980s the G-7 began to discuss major international concerns as part of their agenda, particularly in Ottawa (1981) and Versailles (1982), which emphasized terrorism, arms proliferation, and conflict in the Middle East. Financial concerns and fiscal policies still contributed heavily to discussions among the representatives, primarily at the G-7 summit in Tokyo (1986), which emphasized addressing domestic monetary policies on the part of member nations.

By the late 1980s, G-7 summits began to address global environmental and health concerns, particularly the nuclear disaster at Chernobyl, the growing AIDS epidemic, and global warming. In the 1990s, G-7 summits regarded global employment and labor issues as a major topic of concern. At the Munich summit (1992) policy members agreed that nations should attempt to link their domestic sources of labor to global labor markets to ensure adequate employment levels and thus raise standards of living in poor nations.

The G-8 was created to be an informal forum of the major economic powers of the world and lacked the administrative structure of other international institutions such as the United Nations, the World Bank, and the International Monetary Fund. The G-8 does not possess a permanent bureaucracy or set of offices for its respective members and their staffs. The official presidency of the group rotates annually among

the member countries, with each new term beginning on January 1 of that year. The respective member nation assuming the presidency for the year is responsible for planning, coordinating, and hosting a series of meetings of ministers and financial officials, culminating in a midyear summit attended by the heads of state of the respective member countries.

The G-8's annual summits tend to gain much publicity and notoriety in the host country, subjecting them to extensive lobbying by major international advocacy organizations and antiglobalization groups. They typically result in massive street demonstrations by antiglobalization and environmental activists and radicals, many resulting in major altercations with the riot police of the host city. Major criticisms at these demonstrations focus on the idea that G-8 members are responsible for major global issues including widespread poverty in the developing world due to their debt and trading policies with poor countries. These critiques and protests are similar to those leveled at the World Trade Organization (WTO). In recent decades, growing concerns over the G-8's role in combating global warming and the African AIDS epidemic have taken on extreme importance in critiques. The organizers of antiglobalization protests at cities hosting the G8 summit also accuse G8 leaders of creating a vast gap in wealth between the developing and developed worlds.

Introduction to International Law

Although the genesis of international law is deeply rooted in history, modern international law is distinctly marked by the formation of the United Nations (UN) in 1945. The focus of international law changed significantly at this pivotal juncture and resulted in an immediate influx of

treaties and international organizations that reshaped international law to reflect changing global concerns. Predominate among these changes was the emergence of a new philosophy that allowed for international law to protect not only states' rights but also individuals' personal rights.

Until 1945 international law was regarded as a body of law governing states alone. The brutal mass murders and torture mechanisms that were characteristic of World War II Nazi concentration camps, however, prompted international leaders to recognize that the rules of international law are equally applicable to individuals. Because the only way to enforce the law was to prosecute those who violated it, the International Military Tribunal at Nuremberg was established to bring charges against the Nazis for crimes against peace, war crimes, and crimes against humanity. Nuremberg represented the first recognition that individuals' human rights were so sacred that their protection could not be left exclusively in states' hands. Following Europe's example, the Pacific similarly established the International Military Tribunal for the Far East in 1946 to bring these same charges against military and political leaders and nationals of the Empire of Greater Japan in what became known as the Tokyo War Crimes Trial.

The end of World War II also prompted international leaders to attempt to improve relations among nations. International leaders, scarred by the war, were determined to prevent any reoccurrence of the pains their states had recently endured. With four guiding principles, the UN sought to maintain international peace and security, develop friendly relations among nations, achieve international cooperation in solving international problems, and harmonize the actions of nations in the attainment of these ends. The UN, with 192 member states as of 2009, continues to honor these common goals today. Each member state carries one vote in the UN General Assembly, thereby placing all states on equal footing despite their economic or political disparities. Although it has its lofty goals, the UN is not credited with single-handedly avoiding a third world war. Instead, it is regarded as having played a minimal role in international dispute management. Nevertheless, it is best known for

➤ BANNING LAND MINES

The Ottawa Treaty, or formally the Convention on the Prohibition of the Use, Stockpiling, Production and Transfer of Anti-Personnel Mines and on Their Destruction, bans the use of land mines. The treaty applies only to antipersonnel mines and requires their complete destruction except for a limited number, which can be retained for training purposes. Currently, 158 countries have signed the treaty, while 37 states are not party to the convention. The most important countries that have not signed are the United States, India, Russia, and China. These countries cite pressing defensive needs, with the United States concerned about the demilitarized zone between North and South Korea, while India deems them necessary to prevent infiltration along the Jammu and Kashmir states.

Two people in particular have been credited with creating public interest in the banning of anti-personnel mines: Diana, Princess of Wales, and former Canadian foreign affairs minister Lloyd Axworthy. Princess Diana visited Angola and Bosnia in 1997 and spoke out strongly against the maiming and killing of soldiers and civilians via land mines. Princess Diana's death in August 1997 created public sympathy for her cause and convinced Britain and many other countries to ratify the agreement. Axworthy, who sponsored the Ottawa Treaty, was nominated for the Nobel Peace Prize in 1997.

its proliferation of the role of treaties in the international community.

International law, since roughly 1945, is best described as a complex web of treaties and agreements, sometimes seeking to serve as the overarching law of the land and other times to fill gaps where state law governance is uncertain. Treaties address a broad range of legal topics, including the law of the sea, the law of war, international humanitarian law, trade, intellectual property, and international criminal law. Treaties bind those nations that have signed on to them and, in accordance with general principles of international law, they must be executed in good faith.

With the significant growth of treaties, however, came the need for interpretation and

clarification of the rules and principles of international law. Because a treaty's application to specific disputes is not often crystal clear, judicial interpretation is frequently necessary to resolve any remaining uncertainties. Thus, in 1945 the International Court of Justice (ICJ) was formed to replace the then-defunct Permanent Court of International Justice. Since 1945 the ICJ has served as the principal judicial organ of the UN, helping to mold rules of international law. By its own concession, the ICJ's decisions have no binding force except between parties involved in cases adjudicated by the ICJ. The ICJ does, however, frequently look to its previous decisions to justify new rulings. The court will always enforce a treaty's plain language, but when the treaty's language is ambiguous, the ICJ's prior decisions with respect to the treaty's meaning often affects the ICJ's subsequent interpretation of those rules of law.

With the UN and the ICJ firmly in place, treaties became an effective tool to address the concerns of a changing society. Specifically, in the years between the end of World War II and the end of the Cold War, nations continually urged for arms control and disarmament. Reflective of this sentiment, treaties controlling and limiting nuclear weapons took form. By the early 1990s serious efforts were made to reduce strategic nuclear weapons, and by agreement between the United States and Russia in 2002, the number of nuclear warheads to be deployed by these respective countries was dramatically reduced.

Treaty proponents, following the formation of the UN, were also mindful of the horrific human rights violations that the Nuremberg Trials brought to light. This recognition prompted the Universal Declaration of Human Rights, voted on in 1948. Although it is not a binding international obligation, it is evidence of the customary international standard. This coupled with more than two dozen other human rights conventions reflects the international community's commitment to human rights, but because of their non-binding status these conventions continue to pose enforcement problems.

More recently, international law's focus has turned to issues concerning terrorism and war crimes. Following the September 11, 2001, attacks on the United States, international scholars

have advocated for more effective means of punishing international criminal acts. Currently, the Convention against Torture and the Genocide Conventions apply in times of war and peace, while the 1949 Geneva Convention applies only in times of war or armed conflict. Nevertheless, these conventions have likewise been criticized as lacking an enforcement mechanism strong enough to deter and punish criminal behavior internationally.

Though dating back to 1948, the Convention on the Prevention and Punishment of the Crime of Genocide has not resulted in many genocide trials. Genocide is the attempt to annihilate, in whole or in part, a national, ethnic, racial, or religious group. While the former Yugoslavia and Rwanda have taken up genocide issues, the subject was largely silent until 2006 when an Iraqi court charged Saddam Hussein with genocide for allegedly seeking to annihilate the Kurdish people in the late 1980s. Hussein escaped charges in that trial, however, after his death sentence and subsequent execution in late 2006 stemming from his conviction for murdering 148 Shia men and boys in Dujail, Iraq, in 1982.

More than 60 years have passed since the inception of the UN, and while enforcement problems remain for some of its initiatives, it has largely aided nations in reaching common ground on legal issues. As globalization continues, nations will have increased dealings with one another, further perpetuating the need for uniform laws to apply both where state law is silent and where state laws conflict.

Nuremberg Trials

The Nuremberg Trials, named after the German city in which they took place following World War II, consisted of 13 separate trials of alleged Nazi war criminals under two different military tribunals. The International Military Tribunal (IMT) presided over the first of these trials in which 22 leading Nazis were charged with crimes against peace, war crimes, crimes against humanity, and conspiracy to commit such crimes. The IMT represented the Allies' collective endeavor to hold Nazi leaders accountable for their actions during World War II while maintaining the rule of law. In the process, the IMT established several important precedents for international justice. The subsequent Nuremberg Trials, while adhering to the IMT's principles, were conducted solely under the jurisdiction of U.S. military tribunals.

Allied leaders had discussed the need to bring high-ranking Nazis to justice long before Germany's unconditional surrender on May 8, 1945, but they initially differed on the means of achieving this common goal. British and Soviet

The defendants' dock during the Nuremberg war crimes trials. Organized shortly after the end of World War II in 1945, and continuing through 1946, the Nuremberg Trials convicted nearly two dozen high-level Nazi officials of war crimes. (National Archives)

▶ HOLOCAUST SURVIVORS AS WITNESSES— ABRAHAM SUTZKEVER

At the first Nuremberg Trial, the general failure of the International Military Tribunal (IMT) to distinguish between crimes against humanity and war crimes, together with the emphasis that prosecutors placed on documentary evidence, resulted in the notable absence of Holocaust survivors as witnesses. Only the Soviet prosecution called three Jewish witnesses to the stand, one of whom, Abraham Sutzkever, the Soviet government had rescued from the Vilna area in the final months of that city's occupation by the Nazis.

As a young Yiddish poet incarcerated in the Vilna Ghetto, Sutzkever participated in the ghetto's cultural life and worked to hide Jewish artifacts from the prewar holdings of the YIVO Institute for Jewish Research. He later fought as a partisan after his escape from the ghetto in September 1943 until his Soviet-sponsored flight to Moscow the following March. In the Soviet Union he continued working on the poetry collection he had begun in the ghetto, arranged trips to recover the materials hidden in Vilna, contributed to *The Black Book* documenting the Holocaust of Soviet Jewry, and wrote a memoir designed to provide evidence for war crimes trials, *Fun vilner geto* (*From Vilna Ghetto*).

Sutzkever appeared as a witness at the IMT on February 27, 1946. He testified to the exterminatory measures that the Nazis implemented in Vilna through the end of 1941, by which time the Nazis had murdered the majority of the city's prewar Jewish population of 80,000, including Sutzkever's mother and newborn son.

In 1947, the year following his testimony, Sutzkever immigrated to Israel and continued his Yiddish literary career.

—Elana Jakel

officials favored summarily executing top Nazis, but they later acceded to the U.S. demand for a trial. This decision reflected the larger pattern of retribution across Europe as acts of personal vengeance following the Nazis' retreat gave way to trials organized by postwar governments. Beyond exacting justice, such trials were intended to legitimize the new leadership or, in the case of the IMT, the Allied occupying powers in Ger-

many. The Allies also considered the IMT part of their campaign to denazify Germans and accordingly publicized the trials' proceedings and their evidence of Nazi war crimes throughout Germany. In this respect, the choice of Nuremberg for the trials' venue was significant, as the city previously had hosted mass Nazi rallies and had lent its name to the infamous Nuremberg Laws of 1935, which severely restricted the rights of German Jews.

On August 8, 1945, representatives of the Allies concluded the so-called London Agreement, which included a charter specifying the IMT's authority and working procedures. Two judges each from France, Great Britain, the Soviet Union, and the United States served on the tribunal. Following military protocol, no jury heard the trial. Only war crimes committed by the Nazis and their collaborators, not by any of the Allied forces, fell under the tribunal's jurisdiction. Prosecutors from the Allied nations divided responsibility for proving the charges against the accused, although the interrelated nature of the crimes ensured repetition in the prosecution's case as a whole. This overlap contributed to the length of the trial, which lasted from November 1945 to October 1946.

Considerable controversy surrounded the charges themselves. The charge of war crimes, including acts of unprovoked violence against civilians and prisoners of war, had the most solid basis in international law due to its treatment in the Geneva Convention and the Hague Convention on war first established in the late nineteenth century. At the Americans' insistence, however, the IMT emphasized crimes against peace, that is, that the Nazis conducted an aggressive war in violation of international peace treaties. These charges as well as charges of conspiracy to commit crimes against peace were stressed more than war crimes. The final charge of crimes against humanity represented a legal innovation in response to Nazi atrocities against the Jews in particular. More than the other charges, then, crimes against humanity provoked criticism that the tribunal lacked the authority to try the accused for crimes that first had been identified as such after the fact. In practice, however, the IMT generally failed to distinguish between crimes against humanity and war crimes.

Criticism of the IMT did not end with the trials' charges. Many critics in Germany as well as in the Allied countries questioned the Allies' right to hold such a tribunal and considered the first Nuremberg Trial an exercise in victor's justice or even a show trial. The Soviet Union's involvement in the tribunal reinforced such claims since, under different circumstances, Soviet officials could have faced charges identical to those of their Nazi counterparts: the Soviet leadership had conspired with Nazi Germany to divide Poland between them following the country's invasion by the Nazis, Soviet troops had committed their own war crimes against German civilians toward the war's end, and the Soviet Union's humanitarian record under Josef Stalin left much to be desired. According to the terms of IMT's charter, however, the accused could not raise such issues in their defense.

To the tribunal's credit, the accused received ample opportunity for their defense; furthermore, the acquittal of two of the defendants, Hjalmar Schacht and Hans Fritzsche, demonstrated that the verdicts were not predetermined. Four of the defendants received prison sentences ranging in length from 10 to 20 years, while an additional three—including the mentally ill Rudolf Hess—received a life sentence. The tribunal sentenced the remaining 12 defendants to death by hanging. Among these condemned men were Hermann Goering, the Nazis' second in command who committed suicide prior to his execution; Foreign Minister Joachim von Ribbentrop, who cosigned the pact that divided Poland between the Nazis and the Soviets; leading Nazi theorist Alfred Rosenberg; Hans Frank, the governor-general of occupied Poland; and General Alfred Jodl.

The documentation of Nazi atrocities and the prosecution of crimes against humanity are now considered the most important legacies of the Nuremberg Trials. The prosecution's decision to base its case on documentary evidence produced by the Nazis proved crucial in preserving a record of the Holocaust and atrocities against other groups targeted by the Nazis. In addition, although the IMT linked crimes against humanity to war crimes and thus declined to judge Nazi policies toward German Jews before the war, these trials helped establish the legitimacy

of crimes against humanity as an issue in international law. Accordingly, the IMT recently has been invoked as the guiding precedent in the war crimes tribunals for Bosnia and Rwanda and for the establishment of the International Criminal Court. The IMT also set a precedent in refusing to recognize following orders as a legitimate defense for those accused of crimes against humanity.

Acting under their authority as an occupying power, American military tribunals proceeded to try an additional 12 war crimes cases at Nuremberg from November 1946 to April 1949. The defendants in these cases ranged from judges to industrialists to military officers, further documenting the complicity of individuals across the social stratum in the Nazi project. These trials also amassed important evidence of Nazi atrocities against the Jews and others they deemed undesirable. Notably, the details of human experimentation revealed in one of these trials, the Medical Case, prompted a dialogue on the ethics and limits of performing medical experiments on humans that continues today.

World Courts—The International Court of Justice and the International Criminal Court

The ambiguous term "World Court" refers to either the International Court of Justice (ICJ), affiliated with the United Nations (UN), or the International Criminal Court (ICC). The ICJ is an international judicial body designated to settle international disputes between the world's

➤ THE HAGUE—WORLD'S JUDICIAL CAPITAL

Both the International Court of Justice and the International Criminal Court are located in The Hague in the Netherlands, which is also home to more than 150 international legal organizations and institutions, such as the European Police Office (EUROPOL), EUROJUST, and the Organization for the Prohibition of Chemical Weapons (OPCW), making it known as the “international city of peace and justice.” The Hague’s history as the center for international legal institutions began in 1899, with the first international Peace Conference taking place there followed by a second one in 1907. As a result, the Permanent Court of Arbitration (PCA) was established there, with American philanthropist and peace advocate Andrew Carnegie financing the construction of the PCA headquarters (the Peace Palace).

After the establishment of the League of Nations (1919–1946), The Hague became the seat of its affiliate Permanent Court of International Justice (PCIJ), succeeded by the United Nations International Court of Justice (ICJ) in 1946 following World War II. The creation of the Iran-U.S. Claims Tribunal (1981), the International Criminal Tribunal for the former Yugoslavia (1993), and the International Criminal Court (2002) within the city further established The Hague as the world’s capital of international legal arbitration and institutions of international law.

—*Abraham O. Mendoza*

nation-states. In contrast, the ICC prosecutes individuals for crimes against humanity such as genocide, war crimes, and attempts to destabilize foreign governments. Both institutions evolved from nineteenth-century European intellectual movements that sought to establish institutions of international law to arbitrate through diplomatic means rather than through war. The ICC evolved as a result of the incapacity of the ICJ to prosecute individuals for war crimes when such prosecutions were seen as a violation of the national sovereignty of a particular nation-state.

The Permanent Court of International Justice (PCIJ), which was the predecessor of the ICJ, was the international court of the League of

Nations, established in 1922. From 1922 to 1940 the PCIJ dealt with 29 cases between various nation-states, delivering advisory resolutions that were not legally binding. Its impotence reflected the incapacity of the League of Nations to acquire international legitimacy due to constant violations by rogue states such as Imperial Japan, Fascist Italy, and Nazi Germany in the interwar period (1919–1939). While condemning acts of aggression deemed illegal by international law, the PCIJ was unable to enforce any actions due to the reluctance of the status quo European powers, Britain and France. In 1946 the PCIJ was replaced by the ICJ following the establishment of the UN.

In contrast with its predecessor, the ICJ—which brokers international disputes between nation-states—was granted greater legitimacy owing to the fact that in passing a judgment regarding an international affair or conflict, it had the backing of the UN Security Council on contentious issues, such as war or acts of aggression. Chapter 14 of the UN Charter authorizes the Security Council to enforce World Court rulings; however, such rulings are subject to the veto of any of the five permanent members (United States, United Kingdom, France, China, and Russia). The ICJ’s main duties are to settle legal disputes submitted to it by UN member states and to give advisory opinions on legal issues submitted by authorized international institutions, organizations, and the UN General Assembly. The ICJ is composed of 15 judges elected to nine-year terms by the UN General Assembly and the UN Security Council. These judges are chosen from a list of persons nominated by their nations to the Permanent Court of Arbitration. The five permanent member nations of the Security Council are each guaranteed a seat on the bench.

The jurisdiction of the ICJ has been an issue of debate since its inception due to the level of exceptions for various nations. According to Article 93 of the UN Charter, all UN members are instantly parties to the Court’s jurisdiction, and non-UN states may also become parties to the ICJ under Article 93(2). After a state has become a party to an ICJ case, it is entitled to take part in associated cases brought before the Court, but

that does not automatically give the Court jurisdiction in disputes involving nonmembers. Major critics of the ICJ suggest that its so-called compulsory jurisdiction is only in cases where two parties agree to submit to its decision, thereby lessening its effectiveness. A notable example is that the United States is withdrawn from compulsory jurisdiction and is therefore not bound to follow ICJ rulings. Furthermore, national and international organizations, multinational corporations, and individuals are excluded from the ICJ, which directs its efforts only to states. Moreover, UN agencies can operate only in an advisory capacity and cannot be involved as a party in a case. Last, the Security Council has veto power over the ICJ, which allows its permanent members to overrule decisions even when bound to follow the Court's findings. For example, the United States refused to abide by the ICJ's decision in *Nicaragua v. the United States* in 1986 (regarding U.S. support of rightist guerrillas fighting against the Nicaragua government forces), thereby circumventing its ruling altogether.

The ICC is a permanent tribunal to prosecute individuals for genocide, crimes against humanity, and war crimes and was established in 2002 through the Rome Statute of the International Criminal Court. The ICC's precursor is the famous postwar Nuremberg Trials, which were an international effort to prosecute and sentence German and Japanese war criminals. While the ICJ served as a means of settling and arbitrating conflicts between UN member nations, it stopped short of prosecuting criminals internationally. The UN General Assembly delegated the International Law Commission to come up with an idea for an international criminal court. It prepared two draft statutes by the early 1950s, but the international climate created by the Cold War made the whole idea untenable. However, episodes of ethnic cleansing in the 1990s in both Yugoslavia and Rwanda sparked international out-

rage, which emphasized the contemporary need for an international criminal court.

The ICC has jurisdiction limited to cases where the accused is a national of a member state, the alleged crime took place on the soil of a member state, or a situation is referred to the Court by the UN Security Council. The ICC is designed as a complement to its component members' judicial systems, specifically when national courts are unable (or unwilling) to investigate or prosecute, and thereby relinquishes initial responsibility to investigate and punish crimes to individual states. Currently, 105 states are members of the Court, and a further 41 countries are signatories yet to ratify the Rome Statute. States such as China, India, Israel, and the United States are currently not members, as they view the ICC as an intrusive international institution that could potentially infringe on their national sovereignty and freedom of action in foreign affairs.

Much like the ICJ, the ICC is allowed jurisdiction in affairs dealing with a particular nation-state so long as the state, as a signatory power granting the ICC the authority, allows it to do so. The most recent episodes in which the ICC has been involved concern incidents in the African states of Uganda, the Democratic Republic of the Congo, the African Central Republic, and, most notably, the current ethnic cleansing campaign in the Darfur province in Sudan.

■ Introduction: Decolonization

Following World War II, the European imperial powers began to divest themselves of their colonial holdings. There are many reasons for the end of the colonial period. The defeat of the Axis nations forced Italy, Germany, and Japan to give up their colonial holdings. At the same time, the expense of war and the damage to the economies and infrastructure of Europe's former Allied nations made the cost of maintaining their own empires prohibitive. In the colonies, a move toward parliamentary-style governments undercut much of the call for the civilizing mission and legitimacy—both at home and in the colonies—for empire.

In India and the Palestinian Mandate, there had already been independence movements harrying the British. Throughout the late 1930s both Jewish and Palestinian groups had protested and used violence against British troops. The Indian movements tended toward nonviolent means to disrupt the government there and had been instrumental in weakening British will to remain in the subcontinent. With the shock and cost of the war, Britain moved to disengage gradually from empire. In the interwar years, the British had created a British Commonwealth of Nations, a guise to make their conquests seem not so much an empire but an alliance. Following the war the term “British” was taken from the title, but the power disparity between the metropole and the colonies remained the same. Likewise, France attempted to create a French Union similar in character to the Commonwealth idea but with the aim of creating a unifying Francophone culture between the members.

Both the Commonwealth and the Union gave preferential trade relations to their former colonies and also sought unskilled labor to aid in the rebuilding of their nations following the war. The migration patterns in both countries show the majority of the immigrants in Britain and France to have come from areas under their colonial administration—West Africans and Algerians to southern France and East Africans and West Indians to Britain—during this period. Migration from the metropole to the colonies also occurred, with educated and skilled people leav-

ing for their homelands to take part in the government and economies in these former colonies. The Commonwealth/Union guise made decolonization easier for the imperial powers. They could maintain the benefits of access to raw materials and labor while ridding themselves of the responsibility of governance in the colonies. It also allowed for mostly peaceful transfer of power from Britain and France to the local governments.

For the French, however, there were several places where French colonials were loathe to give up their status. In Algeria, Madagascar, and Indochina, French settlers and supporters fought not for independence but rather to remain part of the French Union, clashing with native separatist movements such as Ho Chi Minh's guerrillas in Indochina. French intervention to stop the violence in Indochina and later in Algeria was costly in terms of both life and treasure; the former would indirectly lead to the Vietnam War. Violence was also the result of decolonization in India and the Middle East, where hatred flared up. In India, Muslim-Hindu violence led to the partition of India into Pakistan and India in 1948. The same year, Jewish and Arab groups clashed over the Palestinian Mandate, which had been divided up by the United Nations into the states of Israel and Palestine. A Pan-Arab army from Egypt, Jordan, and Syria attacked Israel and was repulsed, setting the stage for the current troubles in the region.

The withdrawal of Japanese forces from Korea and China following World War II led to internecine fighting in China between Mao Zedong's communists and Jiang Jieshi's nationalists. In Korea, the victorious U.S. and Soviet forces agreed to divide the peninsula at the 38th parallel. Both of the new governments' leaders—the capitalist-leaning Syngman Rhee in South Korea and the communist Kim Il Sung in North Korea—wanted to unite the peninsula under their respective rule. These clashing interests led to the Korean War in 1950.

The effects of decolonization are open for debate. One developing consensus, however, is that the speed with which decolonization was

effected was too quick, leading to economic and political destabilization. In this view, the colonial powers withdrew, leaving many former colonies cut off from the metropole and forced into an international system for which they had been ill prepared. Without developed economies or secure bureaucratic structures, these new nations struggled, leading to widespread poverty.

These historians also cite as a reason for ensuing strife the arbitrary national borders that had been carved out by the colonial powers. These borders often disregarded ethnic and linguistic groupings and are regarded as having created issues of power disparity between the various ethnic groups. These power imbalances have led to internecine fighting between groups throughout sub-Saharan Africa. While colonization is often reviled for this, it is important to note that regional and ethnic conflict in Africa was just as rife prior to colonization as in the current day. However, the introduction of modern military technology and tactics has made the fighting more lethal and widespread; the colonial powers' use of force to maintain order legitimized warlords and elected officials in African countries to use similar techniques against their populations.

Finally, decolonization opened new areas of competition for the political ideologies of the Soviet Union and the United States, as seen earlier in the Korean Peninsula. The Soviet Union had been engaged in destabilizing colonial rule since the interwar period, often infusing independence movements with socialist theories regarding the nature of imperialism as the last phase of capitalism. To counter this in the postwar era, the United States would sponsor anticommunist leaders, whether or not they embraced democratic principles. More than decolonization itself, the sudden power vacuum in these underdeveloped areas left them open to manipulation by the United States or the Soviet Union. This Cold War manipulation, more than anything, created the political climate that allowed for the rampant corruption that has plagued many of these societies since the end of World War II.

British Decolonization

The British empire reached its greatest extent after World War I, by which time it covered one quarter of the earth's surface and governed a similar proportion of the world's population. Yet between 1947 and 1964, Britain granted independence to most of its colonies. Unlike other empires in history—such as the Roman, Byzantine, Ottoman, or Habsburg empires—the collapse of the British empire was remarkably rapid. Historical debates remain over the causes if not the chronology of British decolonization. In particular, historians disagree on the relative importance of the metropolitan (domestic British), colonial (nationalist), and international causes of British decolonization. British decolonization is usually associated with the period after 1945, but the 1931 Statute of Westminster had already granted independence to the white Dominions of Australia, Canada, Eire (Irish Free State), Newfoundland, New Zealand, and South Africa. After World War II and much conflict in India, Clement Attlee's Labour government gave independence to India, Pakistan, Burma, and Ceylon; terminated Britain's Mandate in Palestine; and prepared for the end of British rule in the West African colonies of the Gold Coast (Ghana) and Nigeria. The Conservative governments of Winston Churchill and Anthony Eden were less enthusiastic about liquidating the British empire. Between 1951 and 1957, Britain created unsuccessful federations of British colonial territories in Central Africa and the West Indies but also granted independence to Sudan, Ghana, and Malaya.

Eden's successor as prime minister, Harold Macmillan, recognized that Britain needed to accelerate the pace of colonial withdrawal, so between 1957 and 1963 nine African colonies and the Mediterranean island of Cyprus demanded and gained their independence. In 1964 Labour returned to power under the leadership of Harold

Wilson, and the process of African decolonization continued. However, Wilson ran into a serious problem in 1965 when the white settler minority of Southern Rhodesia unilaterally and illegally declared itself independent. Wilson also announced in 1967 that Britain could no longer maintain its position as a colonial power east of Suez and began the process of withdrawal from Aden and the Gulf States.

In the 1970s, the process of British decolonization largely came to an end. Britain withdrew from its bases in Singapore, divested itself of its smaller colonies in the Caribbean and the Pacific, and in 1980 was finally able to grant independence to Rhodesia (Zimbabwe). The Falklands War of 1982 reminded Britain that it still had responsibilities to very small numbers of colonial subjects in far-flung outposts, but despite some rhetoric about the British imperial spirit, it was clear that the Falklands War was an aberration. In 1997 Britain handed back Hong Kong to China, and as of 2009 there is little left of the British empire apart from a few small territories such as the Falkland Islands, the Cayman Islands, and Gibraltar. Most former colonies have, however, become members of the Commonwealth, which remains a significant international organization.

What caused British decolonization? Economic pressures seem to be relevant because several instances of colonial withdrawal—in 1931, 1947, 1957, and 1967—coincided with economic crises. On the other hand, the development of Dominion status and decisions on Indian and African independence had antecedents that went back much further than the difficult economic circumstances that attended those episodes of decolonization. Economics were clearly relevant to the 1967 decision to withdraw from east of Suez. By this time Britain could not afford to discharge its global military roles because the British economy was relatively weak and the cost of military hardware was increasing exponentially. It is also worth noting that by the 1960s most British exports were going to Europe rather than the Commonwealth. It was during this period that Britain accelerated decolonization in Africa and applied to join the European Economic Community. However, the changing pattern of British trade was apparently the result, rather than the cause, of British decisions on decolonization.

Imperial issues, largely absent from general elections, indicate that British electoral politics and party ideologies were not significant factors encouraging decolonization. Decolonization tended to cause more debate within political parties than between them. This was particularly true for the Conservative Party, which oversaw much of Britain's colonial withdrawal during 1951–1964 despite the fact that many Conservatives were opposed to decolonization. A more significant political factor to consider is the official mind of British policy makers. It is no longer fashionable to suggest that they simply recognized that the time was ripe to grant independence to the colonial peoples whom the British had carefully groomed to govern themselves. It has been suggested that Britain's ruling elite lost its will to govern the colonies, but policy makers searched constantly to maintain Britain's global power, and the desire to preserve British influence also remained even when formal power was relinquished. Historians such as John Gallagher, Ronald E. Robinson, and William Roger Louis have asserted that as Britain withdrew from its empire, it cultivated good relations with colonial elites and reverted to the nineteenth-century technique of informal imperialism. On the other hand, historians Peter J. Cain and Anthony G. Hopkins have demonstrated that the City of London (Britain's finance center) turned increasingly away from the empire-Commonwealth and the sterling area (or group of countries that based their currency on the sterling pound), which undermined the strategy of informal imperialism. There is therefore some dispute about metropolitan explanations of British decolonization.

Although British policy makers sought to maintain Britain's global influence, this was becoming increasingly difficult as a result of international developments. During the interwar period, the League of Nations Mandate system introduced the idea of accountability into colonial administration, suggesting that imperial powers had a responsibility to develop territories for the benefit of the colonial population. World War II gave great hope to colonial nationalist movements. The Atlantic Charter of August 1941 suggested, among other things, that territorial adjustments after the war must accord with the

wishes of the people in those territories, which colonial peoples thought applied to them as well as the population of occupied territories in Europe. In 1941–1942, Japanese military success against the British and other European empires in the Far East shattered the image of white racial superiority that underpinned imperialism.

After World War II, the United Nations (UN) provided a critical forum for anticolonial pressure. Chapter XI of the UN Charter established the principles that guided UN decolonization efforts, while Chapters XII and XIII established the International Trusteeship System and Trusteeship Council that succeeded the League of Nations Mandate system. The 1960 Declaration on the Granting of Independence to Colonial Countries and Peoples and the General Assembly Special Committee on Decolonization established two years later were a source of great pressure on Britain, especially in relation to difficult racial issues such as the Central African Federation and Southern Rhodesia. The British Commonwealth of Nations was another forum through which former British colonies could exert pressure on British imperial policy, and this consideration was never far from the minds of British policy makers, especially after the African members compelled South Africa to withdraw from the Commonwealth in 1961.

Britain also had to contend with contradictory impulses from the United States in the context of the Cold War. The United States was ideologically opposed to imperialism and put pressure on Britain to quit its colonies so that the United States could gain access to new markets and resources. After 1960 it also seemed desirable to force the pace of decolonization in Africa to prevent communism from becoming more attractive to nationalist movements seeking international support. Yet based on the dictates of the Cold War, the United States also urged Britain to intervene militarily or slow the pace of decolonization where it looked as if an independent territory would turn communist, such as in Zanzibar and British Guiana during the 1960s. Changes in the international environment were sometimes critical for establishing the conditions in which decolonization could take place. For example, the collapse of the Portuguese empire in Africa in 1974–1975 exposed

the flank of the white supremacist regime in Rhodesia to infiltration by nationalist guerrilla forces from Angola and Mozambique. This generated sufficient pressure to set in motion the process by which Rhodesia became legally independent as the state of Zimbabwe in 1980.

Historians disagree most strongly on the significance of colonial nationalism as a factor in British decolonization. It is unclear whether nationalist groups such as Sinn Féin in Ireland, the All India Muslim League and Indian National Congress, or the National Organization of Cypriot Fighters caused Britain to withdraw from its colonies or merely accelerated a process to which the British were already committed. What is certainly true is that colonial nationalism often shaped the postimperial state as much as British constitutionalism. For example, the Attlee government wanted to leave behind a unitary state when it quit India, but the strength of Muslim nationalism and Britain's tendency to play Hindus and Muslims against one another led to the creation of an independent Pakistan. The Central African Federation, established in 1953, was supposed to create a middle ground between the demands of African nationalists for independence on the basis of majority rule and the refusal of the white minority to countenance this, but during 1959–1963 the federation caved under the weight of its own contradictions. Similarly, the Federation of South Arabia, which was established in 1963 and lasted only four years, failed because Aden Colony was not politically compatible with the Arab Emirates of the south to which it was joined. The significance of colonial nationalism must therefore be considered seriously in any account of British decolonization.

French Decolonization

The process of decolonization throughout the French dominions was characterized by the reluctance on the part of metropolitan France to end the imperial venture, although the ensuing battles with guerrilla forces and growing domestic and international opposition would bring the era of French colonial domination to a swift end. The experience of World War II had been a traumatic experience for France and its vast empire in northern and western Africa, and Southeast Asia served as a reminder of its grandeur. However, World War II also unleashed the forces of nationalism and resistance to European imperialism throughout the colonized world. Within two decades, France was forced to abandon its empire due to the Indochina War (1946–1954), the Algerian War of Independence (1954–1962), and a relatively peaceful withdrawal from its African colonies after a failed French attempt to

form a commonwealth through the French Community (1960).

During World War II, much of the French empire had been retained by the Vichy occupation government with the exception of French Indochina (Vietnam, Laos, and Cambodia), which fell to the Japanese forces. The Japanese occupation had shown Southeast Asian nationalists, particularly future Vietnamese leader Ho Chi Minh, the vulnerability of French power. Similarly, French African colonial forces, subject to the Free French forces seeking to liberate France from the German yoke, saw their role as crucial to the European theater of war. Yet they also recognized their subsidiary position to the French forces and their place as second-class citizens within the French Empire. Both cases triggered resentment against French domination immediately after the war when France attempted to reassert its authority throughout the colonies.

In the immediate postwar period, French military forces regained control of Indochina after the withdrawal of Japanese forces, having relied on Allied forces to liberate the region. However, rather than encountering cheering throngs of Southeast Asians celebrating their return, they found nationalist guerrillas resisting the return of French power. From 1946 to 1954, French forces battled the Viet Minh under the leadership of Ho Chi Minh. The Indochina War finally ended when French forces were routed by the Viet Minh in the Battle of Dien Bien Phu on May 7, 1954. The resulting Geneva peace agreement ended French colonial rule of Indochina and divided Vietnam at the 17th parallel. This partition created further complications due to communist activities in both parts of the country and would eventually lead to U.S. involvement (the Vietnam War).

In addition to Dien Bien Phu, 1954 was also a crucial year for the battle against French imperialism in French Algeria with the formation of the Algerian National Liberation Front (FLN). This group, composed of Algerian nationalists, sought to end French rule through guerrilla warfare in the countryside and eventually in urban areas, relying on terrorist tactics that involved kidnappings, bombings, and the murders of Europeans and non-FLN Muslims. Tunisia and Morocco were granted independence by France in 1956 to pre-

Under the guard of Communist Viet Minh troops, French and Vietnamese prisoners of war march from the battlefields of Dien Bien Phu. The Battle of Dien Bien Phu marked the fall of French colonialism in Indochina in 1954. (Bettmann/Corbis)

► BELGIUM'S ABRUPT DECOLONIZATION—THE CASE OF THE CONGO

With the demands for independence in Africa growing, Britain and France made 1960 a benchmark year for decolonization. That same year, the Belgian colony of the Congo was also granted its independence by the Belgium government but in a way that ensured the instability of the region for decades to come. When Belgium decided to leave the Congo, it did so with the knowledge that it would have to fight a costly war with the indigenous nationalist insurgents, which it could ill afford. Rather than ensure that the postcolonial government was able to adequately govern over the vast territories and numerous provinces that made up the Congo, a tactic that British and French authorities tried with mixed results, the Belgians abandoned the Congo, leaving behind 30 Congolese university graduates to fill approximately 4,000 civil service positions to rule over 200 distinct African tribes constituting 22 million people.

The Congo was immediately caught up in the global Cold War rivalry between the United States and the Soviet Union during which factions based around the legitimate government (divided between noncommunist and communist factions) and secessionist insurgents received outside financial support to battle within the power vacuum created by the Belgians' departure. The Congolese Civil War erupted between rival factions, with one seeking to unite the rapidly dis-

Citizens parade through the streets in Leopoldville, Belgian Congo, celebrating their coming independence, 1960. (Library of Congress)

integrating country, even as provinces declared their independence from the state. Noncommunist authoritarian Mobutu Sese Seko (r. 1965–1996) eventually seized power from the legitimate government after the fighting ended and the secessionists were defeated. He subsequently set about making himself dictator of the new nation of Zaire, as the Congo was now known, leading to decades of authoritarian rule and widespread corruption until his fall from power in 1996.

—Abraham O. Mendoza

vent a similar conflict with their nationalist movements. However, France had ruled Algeria since 1830 and was seen as contiguous to the French state in public consciousness, having been a part of metropolitan France for a century, with a large French-ethnic population, making some reluctant to let it go. The FLN gained mass support among the Algerian populace in its efforts to expel the French. The French responded by sending in troops to pacify the region, resulting in a campaign of terror characterized by torture, executions, and the abuse of civilians. French military excesses in Algeria led to a divided French public opinion between those who sought to escalate military involvement and those who condemned French actions against innocent Al-

gerians. In 1958 after French colonists opposed to Algerian independence overthrew the French colonial administration in Algeria, Charles De Gaulle returned to power as president to resolve the situation.

However, after De Gaulle decided to negotiate Algerian independence in 1959, extremist French Algerian settlers formed the Secret Army Organization (OAS) to oust De Gaulle and his alleged FLN supporters from power. The OAS and its terrorist activities against Algerians and French authorities shocked and galvanized domestic French opposition to France's presence in Algeria, generating greater public outrage and a desire to grant Algeria independence. A cease-fire between French forces and the FLN in 1962

allowed for a referendum for Algerians to choose their destiny, culminating in the overwhelming vote for independence on July 1, 1962. The result was a mass exodus of approximately 1 million ethnic French Algerians (*pied noirs*, or “black feet”) and Muslim Algerians who had supported French authority into France.

France had fought and lost wars in Indochina and Algeria yet retained some influence over its remaining French colonies in Africa by the creation of the French Community in 1958. President De Gaulle issued a referendum to France’s remaining territories, proposing membership in this political arrangement under French tutelage. Within this system, French colonies would become self-governing states with exclusive trade and economic agreements with France and would retain the right to secede. The French Community was an attempt to retain French prestige as a global power (utilizing the British Commonwealth as a model) and to prevent allegations of French imperialism by the superpowers (the United States and the Soviet Union). Most of the French colonies (with the exception of Guinea) opted to join the French Community, enthusiastically embracing it as a vehicle for social and political advancement and economic development.

However, France instituted limited economic assistance and granted few political and civil rights to the citizens of the French Community. Growing resentment from African labor unions particularly in Senegal, seeking wages on par with their European counterparts and the denial of substantial French financial assistance, finally convinced many African leaders to ask for independence from France. In 1960 the French Community was officially dissolved as France accepted the demand for independence by the French African states (Senegal, Ivory Coast, Mauritania, Mali, Benin, Burkina Faso, Chad, Gabon, Central African Republic, Congo Republic, and Madagascar).

Decolonization—Portugal

In the nineteenth century, Portugal was the fifth-largest colonial power in the world. What had once been an empire centered on Asia was one that was now concentrated on Africa, with minor colonial holdings in India, Indonesia, and China. By the mid-twentieth century, Portugal still retained the vestiges of its African colonial empire with its colonies in Angola, Mozambique, the Cape Verde Islands, São Tomé and Príncipe, and Guinea Bissau. However, Africans in these territories did not benefit from this relationship. Portugal’s government was under the dictatorship of Antonio Salazar, who ruled the colonies the way he did the metropole. The loss of Brazil in the nineteenth century as well as the Great Depression of the 1930s prompted the Portuguese to squeeze as much money as they could out of their remaining colonies. Portugal’s African colonies, especially the diamond mines of Angola, provided a considerable portion of overall national wealth, which prompted Salazar to maintain his grip over the colonial economies. However, this came at quite a cost to the indigenous Africans. Because the Portuguese state did not have money to invest in Africa, Portugal made much of its money by compulsory labor in the mines and plantations, selling migrant worker contracts to the South African government, and through forced crop taxes.

Since 1910, Portugal had maintained a policy of segregation based on color, which promoted the forced labor system, an unofficial continuation of slavery. Until the 1950s, Portugal’s African colonies remained largely underdeveloped, as the Portuguese preferred to rely on this system of forced labor in order to exploit resources. However, a post-World War II boom prompted a campaign to initiate economic development, which led to a fairly large amount of immigration of Portuguese peasants to Africa. Despite the increased interest, Portugal’s relationship with its colonial citizens remained unchanged. And de-

spite the colonies' new statuses as overseas provinces, the colonized Africans received very few benefits. Only a select amount of black Africans were able to achieve citizenship on par with the white European immigrants, leaving a large number of people dissatisfied with the situation.

In 1960 and 1961, several revolts broke out in Angola in response to these growing tensions, and Guinea followed in 1962. Despite the large number of Portuguese troops sent to subdue the rebels in Guinea, the rebels still managed to capture 75 percent of the countryside, with the Portuguese holding onto only the cities and a few forts. Another 40,000 troops were sent to Angola, which began a bloody guerrilla-style war comparable to the Vietnam War, as the indigenous Africans used their knowledge of the jungle in order to gain advantage over the Portuguese. Over time, the wars in the colonies became overly burdensome for the Portuguese. By the end of the decade, the Portuguese government was spending half of its annual budget on its wars with the Africans. However, this along with help from other Western nations was not enough to claim a vic-

tory against the Africans. This caused a loss of morale, and support for the colonial wars waned considerably. Salazar continued his relentless campaign against Africa as did his successor Marcelo Caetano, who took control of the government when Salazar became incapacitated due to an accident in 1968. This policy halted only when Caetano was overthrown in 1974 after a military coup, known as the Carnation Revolution, and democracy was restored to Portugal. After the revolution, the Portuguese began to concentrate on domestic issues and realized that continued warfare in Africa was fruitless.

As a result, most of the colonies received their independence from Portugal throughout 1975. Portugal granted independence to all of its African colonies as well as its Indian ones and East Timor in Indonesia. The more than one million Portuguese who had immigrated to Africa and India returned to Portugal immediately after and were dubbed the *retornados*, or the "ones who returned." Unfortunately, independence did not improve the situation for Mozambique or Angola, as the removal of the colonial government

► COMMUNITY OF PORTUGUESE LANGUAGE COUNTRIES

The Community of Portuguese Language Countries, or Comunidade dos Países de Língua Portuguesa (CPLP), was formed in 1996 and consists of Lusophone (Portuguese-speaking) countries. The charter members consisted of Portugal, Brazil, Guinea-Bissau, Angola, São Tomé and Príncipe, Mozambique, and Cape Verde. In 2002, the island of East Timor joined after receiving its independence from Indonesia. The purpose of the organization is to join these countries that share a lingual and cultural connection based on their former connections with Portugal. Because of this goal, other countries that do not use Portuguese as their official language but were Portuguese colonies at one time are also showing an interest in joining. Macau, Goa, Indonesia, Galicia, Equatorial Guinea, Senegal, and Mauritius among others have been admitted as associate observers based on their historical links with Portugal. Interestingly, other countries that have no connection with Portugal or the Portuguese language have also shown

interest in joining, including the Philippines, Ukraine, Romania, and Croatia.

The CPLP has both political and social goals. The organization has been key in helping countries such as São Tomé and Príncipe and Guinea-Bissau recover from coup d'états by assisting in economic and democratic reforms in the two countries. The organization is also helping in social reforms. Many children in rural Africa and East Timor are not attending school and are therefore unable to speak or read Portuguese, meaning that they cannot gain employment or participate in mainstream society. The CPLP has sought to help these children by setting up Portuguese-language schools, which will not only help them in their own countries but also make it possible for them to communicate with other parts of the world, particularly Portugal, whose economy is stronger. Finally, the CPLP has taken on programs to help with both the AIDS and malaria crises in Africa.

—Monique Vallance

sparked civil wars in both countries that lasted until the 1990s. East Timor was almost immediately conquered by Indonesia after receiving its independence and remained so until 1999. As for Macau in China, it was redefined from an overseas province to a Chinese territory under Portuguese administration. It was finally returned to Chinese control in 1999. Today, the former colonies still struggle to reconcile their indigenous identities with their colonial pasts.

Dutch Decolonization

The abolishment of the Dutch West India Company in 1791 and the bankruptcy of the Dutch East India Company in 1800 provided the Netherlands with the largest empire in its history, as the colonies then were nationalized and absorbed into the empire. This expansion meant that the Dutch would control Indonesia as well as the Antilles and Suriname in the Caribbean.

Dutch influence in Indonesia would end in March 1942 after a Japanese invasion in January received the support of the native Indonesians who were seeking independence. After the end of World War II and the defeat of the Japanese in 1945, the Dutch tried unsuccessfully to reclaim Indonesia as a colony, but this ended in 1949 when the Indonesian resistance and international pressure forced the Dutch to concede independence to the Indonesians. However, Western New Guinea remained a part of Netherlands New Guinea until 1962, when pressure from the United States convinced the Dutch to concede it to Indonesia as a part of the New York agreement.

As for the Caribbean, the Dutch consolidated all the islands under their control, except Suriname, into what is now known as the Neth-

erlands Antilles. They were then incorporated into the Kingdom of the Netherlands in 1954 as a separate country within the kingdom. In 1986, the island of Aruba was granted *status aparte*, making it another separate country within the kingdom. These countries were granted semi-autonomy except for matters of foreign relations. In 2005, negotiations opened between the Netherlands and the Caribbean islands as to the future of the Netherlands Antilles. Relations among the islands of the Netherlands Antilles were often strained, as evidenced by the cessation of Aruba. As a result, on October 10, 2010, the Netherlands Antilles are scheduled to be dissolved. The islands of St. Maarten and Curacao will become separate countries within the kingdom, and Bonaire, St. Eustace, and Saba will become municipalities of the Netherlands. This means that residents of these islands will be able to vote in national elections as well as those of the European Union.

The Collapse of the Soviet Union

The most fundamental reason for the collapse of the Soviet Union in 1991 was the failure of communist ideology-based practice to conform to the demands of reality. This showed itself most clearly in three areas: (1) politics, where the political monopoly of the Communist Party of the Soviet Union repressed the creative potential of the citizenry; (2) the centralized command economy, which proved unable to compete with Western capitalist development or even to provide adequately for the Soviet population; and (3) the failure to develop genuine patriotism for the state among the Soviet Union's many national groups. By the time Mikhail Gorbachev came to power in 1985, critical secondary problems were proliferating: severe environmental degradation, declining life expectancies, demographic

➤ COMMONWEALTH OF INDEPENDENT STATES

The Commonwealth of Independent States (CIS) is a confederation of 11 former republics of the Union of Soviet Socialist Republics (USSR) that have joined together to coordinate and to foster economic relations, collective security, and other issues common to these sovereign nations, who share the experience of adjustment to the collapse of the Soviet Union and to the loss of its leadership and dominant influence. Among the former Soviet republics, only the Baltic states—Estonia, Latvia, and Lithuania—have refused to join the CIS. In 2005, Turkmenistan downgraded its role to that of an associate member. While the stated goal of this confederation resembles that of the European Union and similar organizations designed to address regional issues such as establishment of free trade, currency regulations, border security, and antiterrorist policies, Russian influence and regional hegemony have emerged as primary issues in the evaluation of the nature and efficacy of the CIS. Determining the proper role of Russia in this alliance has triggered debate and conflict among member states and has generated questions regarding the fundamental goals and the purpose of the organization.

Since the inception of the Commonwealth of Independent States in 1991, problems involving competing interests and political identities have emerged. Leadership among members accrued to Russia, which gained control of the Soviet nuclear arsenal, the Soviet seat at the United Nations, and vital military bases in the region. Russian gains and influence were offset by

member nations that have become increasingly dissatisfied with Russia's leadership and have looked to the West for guidance and support. In 1997, Georgia, Ukraine, Azerbaijan, and Moldova started the GUAM forum, an organization with pro-Western sympathies. The GUAM forum has since formalized its relationship and courted economic and political favor from the United States and the European Union. Similarly, in 2005, the Community of Democratic Choice formed in Kiev with the expressed purpose of fostering democracy, security, and economic development. This grouping of several former Soviet Republics and East European states, all stretching across "the three seas" (Baltic, Black, and Caspian seas), included the Baltic States, Ukraine, Moldova, and Macedonia.

changes in favor of the non-Russia and non-European segments of the population, alcoholism, absenteeism from work, corruption, and severe disaffection. The Soviet system was in a downward spiral. Gorbachev had to act swiftly to try to save the Soviet Union.

The earliest unmistakable signals of crisis came from the satellite states of the Soviet Bloc in Eastern Europe. The visit to Poland in 1979 of the newly elected Polish pope, John Paul II, who was committed to an anticommunist *Ostpolitik*, was ecstatically received by a nation weary and cynical after years of communist rule. A trade union movement called Solidarity that began in

the Baltic port city of Gdańsk in 1980 rapidly expanded into a national movement of opposition to the communist government. Although Solidarity was repressed during the 1980s, its spirit survived and inspired like-minded oppositionists in other East European countries as well as in the Soviet Union itself. As problems in the Soviet Union grew more acute by the end of the 1980s, Gorbachev determined that the Soviets could no longer afford to prop up the unpopular regimes in these states. What resulted were the Democratic Revolutions, the breathtakingly rapid collapse of communist regimes in one state after another between June and December 1989. The

spirit of the Democratic Revolutions bled over into the Soviet Union itself, first among the Baltic peoples, whose living political memory of independence before World War II produced new independence movements in 1990, and soon spread to Ukraine, Belarus, Moldova, and the Central Asian Republics.

In the meantime in the Soviet Union, the devastating accident at the Chernobyl nuclear power plant in 1986 dramatically exposed to the entire world a catastrophic decline in Soviet competence. Ronald Reagan's 1983 proposal for the expensive Strategic Defense Initiative ("Star Wars") had already revealed the Soviet Union's growing inability to compete in the Cold War, so in 1987 Gorbachev essentially ended it by agreeing to arms limitations and reductions. In a worldwide best-seller *Perestroika: New Thinking for Our Country and the World*, Gorbachev encouraged an end to the Cold War's military standoff and pointed toward a world in which the Soviet regime's dictatorship might indeed "wither away" and be replaced by a truer form of communism. Gorbachev also launched a massive reform campaign in the Soviet Union under the slogans of glasnost (open discourse) and perestroika (restructuring). However, since he tried simultaneously to maintain his commitment to Marxist-Leninist fundamentals, notably centralized political and economic control, and to the unity of the Soviet state, his reform proposals were contradictory and ultimately doomed to failure.

In August 1991, Gorbachev was threatened by what turned out to be a comic-opera coup

attempt by political right-wingers opposed to his reforms. Boris Yeltsin, the recently elected president of the Russian republic, bravely defended the state and Gorbachev himself, even climbing atop a tank in Moscow's Kremlin. Yeltsin's resulting popularity emboldened him to challenge Gorbachev's control of the Soviet Union by calling for an end to the political monopoly of the Communist Party, the transition from state-owned to privately-owned means of production, and the creation of a new Commonwealth of Independent States (to supplant the Union of Soviet Socialist Republics). In late December 1991, all 15 Soviet republics signed the charter of the new Commonwealth. Gorbachev found himself isolated and irrelevant, with no choice but to turn out the lights in his Kremlin office and go home. The Soviet Union was no more.

■ Introduction: Neocolonialism

Neocolonialism is a term used to describe post-World War II international economic arrangements whereby former colonial powers retained or regained some level of economic domination over former colonial possessions and protectorates. Various critics, including Western socialists, Third World revolutionaries, and antiglobalization activists allege

that neoliberal economic policies (particularly free trade), multinational corporations, and international banking and monetary institutions (specifically the World Bank and the International Monetary Fund) perpetuate the economic domination of the postcolonial developing world by former imperial powers. Moreover, international conferences aimed at coordinating the global

economic interests of the developed world (i.e., the Group of Eight, the World Trade Organization, and the World Economic Forum) have garnered the odium of critics of neocolonialism who see these institutions bent on the further subjugation of the postcolonial world by extracting resources, cheap labor, and encouraging import-export imbalances. Geopolitical considerations also play a factor in the development of neocolonialism, particularly in Central Asia and the Middle East where hydrocarbons (oil and natural gas) generate the interest of world powers such as the United States, Russia, and China in addition to emergent regional powers such as Iran and Turkey.

World regions with vital economic resources or production, such as Latin America (consumer goods, cash crops), the Middle East (oil), sub-Saharan Africa (diamonds), and Southeast Asia (electronic goods, toys, clothing), are seen as areas historically prone to the neocolonialist ambitions of Japan, the United States, and the European Union. While the United States did not venture to the same extent as the European Great Powers (Britain, France, and Germany) and Japan in creating global empires in the non-Western world in the scramble for colonies in the late nineteenth and early twentieth centuries, it did create a ubiquitous financial investment network that maintained inexpensive labor sources and ensured the underdevelopment of local industry that might undermine monopolies (i.e., the United Fruit Company in Nicaragua). Marxist and nationalist insurgents' resistance to economically based incursions, particularly in Latin America (i.e., Venezuela, Mexico, Argentina), illustrate these regions' underlying suspicion of alleged Western neocolonial ambitions. Multinational corporation practices leading to the growth of offshoring concerns in Latin America and Southeast Asia (such as the Western-owned *maquiladoras*—manufacturing facilities that import materials and equipment on a duty-free basis for assembly and then reexport the assembled product in Mexico near the U.S. border) that offer low wages to non-Western labor and extend markets to sell goods in less-developed nations at high prices illustrate the complexity of economic globalization and the associated allegations of neocolonialism.

Newly industrializing countries (NICs), such as South Korea, Singapore, Hong Kong (part of the People's Republic of China since 1997), and Taiwan, which were formerly seen as neocolonized entrepôts of Western capital, are now in turn being labeled as neocolonizers as they enter the ranks of the developed world economies. Multinational corporations (MNCs) based in these East Asian states are currently as ubiquitous in the world economy as European- and U.S.-based MNCs were in the immediate postwar world.

—Abraham O. Mendoza

World-Systems Theory

World-systems is a theoretical approach to the study of world history since 1500, developed by American sociologist Immanuel Wallerstein that concentrates on the connections between economics, power, and international relations. His most important work on the subject, *The Modern World-System*, was released in three separate volumes in 1974, 1980, and 1989, igniting scholarly debate and spurring new approaches to world history inspired by the social sciences. Building on established theoretical perspectives from orthodox Marxist literature and neo-Marxist literature on economic development, Wallerstein emphasized the primacy of Western European (and subsequent U.S. and Soviet) economic and political dominance of the world since 1500, as capitalism led to colonialism and more recently to the indirect domination dynamic of neocolonialism. Since the inception of Wallerstein's ideas, other historians have criticized, adapted, or contributed to the growing body of historiography of world-systems analysis, vastly enriching his innovative macrohistorical (or "wide angle") approach to world history, international relations, and global studies.

In the first volume of his work, Wallerstein provides a theoretical framework to explain the historical changes involved in the development of the modern world. He explains the development of the economic and political supremacy of Western Europe in global affairs since 1500, vis-à-vis other major regional powers (such as Ottoman Turkey, Mughal India, Manchu China) following the gradual collapse of the feudal system and the subsequent expansion of capitalism

➤ DEPENDENCY THEORY

Dependency theory, a collection of social science theories that emerged in the 1950s and 1960s prior to Wallerstein's theory of a world system, stipulates that the world is divided among a core of affluent developed regions and a periphery of impoverished underdeveloped regions. In essence, extensive amounts of resources are extracted from the periphery (developing nations) for the benefit of the core states (developed nations), ensuring their continued economic success at the expense of the periphery. Furthermore, the cheap labor of the peripheral regions is exploited to further the wealth of the core states, creating a vast wealth gap between the developed and developing worlds. The impoverished state of the countries in the periphery illustrates the nature of their subordination in the world economy to the wealthier core nations.

Dependency theory was popularized among leftist academics and activists as a theoretical explanation for the neocolonial relationship that existed between the developing world and the West. The theory gradually became discredited given its Eurocentric perspective that denied non-Western regions agency in their economic development.

Several theorists contributed to dependency theory. Economist Raúl Prebisch, affiliated with the Economic Commission on Latin America (ECLA), researched the relationship between the impoverishment of developing nations and the enrichment of the developed world (1950), thereby establishing the key concepts of the core and the periphery. Neo-Marxist scholars, such as historian and sociologist Andre Gunder Frank, adapted the concept to Marxism and its implications of global division of labor in his book *Capitalism and Underdevelopment in Latin America* (1967), extending that premise from social classes to world regions. World-systems theory, first advocated by Immanuel Wallerstein, further expanded on reformist (Prebisch) and Marxist (Gunder Frank) conceptions of dependency theory and vastly altered its message by describing its historical trajectory since 1500 and the inclusion of semiperipheral regions.

—Abraham O. Mendoza

throughout the world. In the late fifteenth and early sixteenth centuries, as the capitalist world-system emerged, it created an economic structure that encompassed a significant portion of the world with links that superseded political boundaries in various world regions, for example, between the British, French, and Russian empires. This new world economy differed from previous imperial systems because it was not characterized by a unitary political unit (medieval national kingdoms, city-states, principalities) or confederation of nations with similar cultural affinities (Holy Roman Empire, Austria-Hungary). These older imperial systems relied on political institutions in which commercial monopolies in tandem with military forces directed the flow of trade from the periphery to the metropole (centers of commerce and finance). Such empires had well-established political boundaries under the control of bureaucratic and military institutions. In contrast, modern capitalism, which characterized Wallerstein's conceptualization of the world-system, allowed the modern world economy to extend beyond the political boundaries of any country, nation, or empire, thereby creating undue influence on the political, social, and economic destinies of dependant world regions.

According to Wallerstein, the capitalist world-system was based on an international division of labor, premised on the division of labor between the two antagonistic social classes (the capitalist *bourgeoisie* and the laboring *proletariat*), defined geographically by the regional economic relationships between the *bourgeois* core and the *proletarian* periphery. Within this framework, each region fell into one of four different categories: core, semiperiphery, periphery, and external. These specific categories illustrate each region's relative position within the world-systems economy. The core regions (i.e., United States, European Union, Soviet Union until 1991, Japan) maintain economic dominance projected by their control of the flow of capital and trade between regions. Semiperipheral regions (South Korea, China, Brazil) are simultaneously dominated and dominant over others, developing key industries that allow them some level of autonomy from the core countries and the ability to exert economic and political agency within peripheral regions. Peripheral regions (much of

Latin America and sub-Saharan Africa) are under the economic and political domination of the core and semiperipheral regions, their political institutions kept in power to further subject the population to economic exploitation (i.e., U.S.-backed anticommunist regimes in Latin America during the Cold War). In earlier periods of capitalist development, external regions sustained their own localized economic systems and remained outside the world system, immune to the domination of core or semiperipheral regions.

The world-systems model, since its introduction in the 1970s, has had a significant impact on thought and research. Wallerstein's theories have gained both critics and supporters, igniting a major debate. Many of the arguments posed against Wallerstein's thesis stem from allegations of his Eurocentric framework—emphasizing the development of capitalism out of Europe, while minimizing the role of other world regions, such as China, India, and Africa. Historian Janet Abu-Lughod has argued for a premodern world-system existing across thirteenth century Eurasia based on the transcontinental hegemony of the Mongol empire. Historian and sociologist Andre Gunder Frank argues that a global scale world-system that includes Asia, Europe, and Africa has existed since approximately 4000 BCE. Historian R. Bin Wong has argued that state formation in China, while developing on a similar trajectory to that of Europe, developed its unique dynamic economic system outside of the constraints of Wallerstein's Eurocentric model. On a similar note, historians Christopher Chase-Dunn and Tom Hall argue that similar developments in urban settlements in the western and eastern parts of "Afroeurasia" (Africa, Europe, and Asia) illustrate the economic interdependence of these world regions, and argue these parallels are evidence of an ancient world-system. All in all, one would be hard-pressed to find a historian who was neutral or indifferent to Wallerstein's theory. His bold and elegantly written work set off a debate that has enriched the study of world history immeasurably.

Neocolonialism in Africa

Neocolonialism is the idea that while formal decolonization took place in Africa from the late 1950s through the 1970s, informal colonialism continues to exist on the continent. Consequently, it is argued that African countries have failed to achieve true sovereignty. This idea is most associated with the work of the former president of Ghana, Kwame Nkrumah, and his book *Neocolonialism: The Last Stage of Imperialism* (1965) in which he sought to outline the structures of continued informal colonialism. Nkrumah argued that colonialism had resulted in the underdevelopment of Africa and the enrichment of Western countries. Postindependence, the power and economic inequalities established under colonialism allowed for the continuing dominance of Western companies and countries in Africa and the continent's ongoing economic exploitation. Nkrumah referred to this phenomenon as flag independence, insisting that substantive economic and social independence remained unachieved. At the same time, the Kenyan author Ngũgĩ Wa Thiong'o argued that genuine liberation would require Africans to decolonize their minds and write in their native rather than colonial languages.

France in contemporary times has been particularly active in its former territories, maintaining monetary links and military bases to keep friendly dictators in power. This policy of maintaining a *chasse gardée* (private hunting ground) in Africa, similar to the U.S. Monroe Doctrine that forbade foreign powers from interfering in the Americas, is known as *Françafrique*. *Françafrique* had both economic and political motives: to generate diplomatic support at the United Nations and to aid *Françafrique* in serving as a counterweight to the Anglo-American special relationship, which has aided U.S. and British influence throughout the former colonized world.

► CHINESE NEOCOLONIALISM IN ZAMBIA?

China is now the world's largest copper consumer and has dramatically increased its presence in Zambia in recent years. Zambia is the third-largest recipient of Chinese foreign investment in Africa, with an estimated 200 Chinese companies active there as of 2007. This investment has been controversial, however, as Chinese companies have been accused of exploiting labor and natural resources, with workers at the Chinese-owned Chambishi mine paid only \$45 (U.S. dollars) a month and never receiving a day off. Six protesting Zambian workers were shot in 2006.

The Chinese presence is most marked in the Copperbelt and in the capital city, Lusaka, where there has also been widespread resentment over increasing numbers of Chinese traders and businesspeople and the leasing of one of the city's main markets to Chinese management. The opposition candidate for president in 2006, Michael Sata, promised to expel the Chinese, prompting the Chinese ambassador to threaten to break diplomatic relations if he was elected, thereby violating the Chinese principle of noninterference in sovereign affairs. There was widespread anti-Chinese rioting in Lusaka after Sata lost the election. The Chinese government has sought to defuse anti-Chinese sentiment by building a sports stadium and an \$800 million industrial zone in northern Zambia.

—*Pádraig R. Carmody*

Perhaps one of the most famous examples of neocolonialism in Africa, and one that overlapped with Cold War politics, was the Belgian-sponsored and U.S. Central Intelligence Agency–approved overthrow of Patrice Lumumba in the Congo in 1960 and the installation of the brutal and corrupt dictator Mobutu Sese Seko, who ruled for nearly 40 years. Lumumba was perceived by the Belgian and U.S. governments as a communist who might nationalize the mining industry, most of which was owned by the Belgian Company Société Générale de Belgique.

The most important mechanisms through which neocolonialism is maintained on the continent is through the international financial institutions of the World Bank and the International

Monetary Fund, which give loans to African governments in exchange for policy reforms. These financial institutions are dominated by the wealthy countries of the world, and based on the size of its contributions, the United States is the only country to hold veto power in both. During the 1980s and 1990s these Bretton Woods institutions promoted the adoption of structural adjustment programs that sought to encourage export-led growth, foreign investment, and privatization. These reforms were heavily criticized by many in Africa for focusing on increasing exports of cheap raw materials and cash crops while allowing Western companies to buy back previously nationalized industries, leading to increased poverty and what amounted, some argued, to a recolonization of the continent.

In the wake of the events of September 11, 2001, U.S. interest in and engagement with Africa increased substantially as the United States sought to diversify its oil supply away from the volatile Middle East and eliminate perceived terrorist threats. The world's largest oil company, Exxon Mobil, headquartered in the United States, now extracts more oil from Africa than any other region of the world.

Wealthier nations' intervention in African affairs is justified on the basis that many of these countries are failed states, with the influential U.S. political scientist and former state department official Stephen Krasner arguing that decent governance requires new forms of trusteeship. However, the U.S. government at the same time has been supportive of dictators such as Nguema Obiang in Equatorial Guinea, a major oil exporter. Obiang's regime has executed missionaries, aid workers, and tourists.

The Chinese government has also increased its involvement in Africa in recent years largely to secure supplies of oil and strategic minerals such as copper to feed its burgeoning industries. According to former British prime minister Tony Blair, China is now the most influential foreign nation in Africa and its second-largest trading partner after the United States. The *Economist* magazine refers to the Chinese in Africa as the new colonialists, and South African president Mbeki has expressed concern over the structure of trade with China, with Africa continuing to export raw materials and import manufactured

goods. In the 2000s in a number of countries such as Zambia, the Chinese presence has been highly controversial, leading to numerous riots, strikes, and shootings reminiscent of the colonial era.

Nkrumah argued that the only way to counter Western domination of the continent was through the creation of a United States of Africa. While this idea did not receive much support, the Organization of African Unity became the African Union in 2002, and the Pan-African parliament now sits in Cape Town, South Africa.

Neocolonialism in the Middle East

After World War II, with the dissolution of European empires in the Middle East, myriad forces reconfigured the geopolitical arrangement of the region. Arab nationalism and Islamism were crucial factors in securing the independence of the postcolonial Middle East; however, removing Western economic influence, particularly amid Cold War antagonisms with the Soviet Union, proved far more difficult. Geopolitical ambitions on the part of the United States and Britain, due to their reluctance to relinquish control of the source base of most of the world's oil, led to them retaining their geopolitical influence by supporting authoritarian regimes.

The United States and its allies deemed the Middle East, the world's major source of oil, of critical strategic importance. Fears of Soviet domination of the region were quite prevalent. As

➤ EISENHOWER DOCTRINE (1957)

On January 5, 1957, U.S. president Dwight D. Eisenhower announced what later became called the Eisenhower Doctrine. He regarded the Middle East as threatened by Soviet expansion. Similar to the earlier Truman Doctrine and its declaration of support to anticommunists, Eisenhower pledged that the United States would assist Middle Eastern states militarily and economically to ensure their independence from the Soviet Union. In a mere two months, Congress passed what came to be known as the Eisenhower Doctrine, which marked the United States as the dominant power in the Middle East, replacing Britain as the major Western power in that region. Since the implementation of the Eisenhower Doctrine, U.S. foreign policy has sustained and supported authoritarian Arab regimes, such as Saudi Arabia, as long as they were pro-Western and anticommunist.

—*Abraham O. Mendoza*

the British and French withdrew from their former colonial possessions during the interwar period and at the end of World War II, these countries yet maintained their economic prerogatives within the framework of these newly independent states. In Iran, Britain was able to retain its oil concessions through the Anglo-Iranian Oil Company (AIOC), which became British Petroleum (BP), in 1954. Similarly, the United States had an agreement with Saudi Arabia to establish the Arab-American Oil Company (ARAMCO) in 1933. In the midst of World War II, the importance of oil grew, and its supply became more pivotal to the West.

British decolonization in the postwar period usually came with preconditions for the newly independent states regarding private property and investments in the region, particularly Kuwait in 1961. In Iran, the situation became untenable in 1951 when democratically elected prime minister Mohammed Mosaddeq nationalized Iran's oil industry, thereby infuriating the British who subsequently staged a global embargo against Iran. Mosaddeq's Tudeh Party affiliation and its link with the Soviet Union encouraged Britain and the United States to place this development in a Cold War context. This led to U.S. Central

Intelligence Agency (CIA) Operation Ajax in 1953. During this operation, CIA agent Kermit Roosevelt staged a coup against Mosaddeq, removing him from power and installing Mohammed Reza Pahlevi. Pahlevi subsequently made arrangements with both Britain and the United States while establishing a dictatorship over Iran. While the Eisenhower administration regarded the coup as necessary to protect the region against the expansion of communism, it was seen by Iranians as overt neocolonial control of their economy through a proxy ruler. Similarly, following the war, the United States supported the House of Saud in Saudi Arabia. This regime imposed severe Islamist laws on the populace that violated human rights. The United States sacrificed such concerns to the strategic goal of providing stability and gaining oil concessions through ARAMCO. Both ARAMCO and BP were seen as agents of neocolonialism by peoples of the region, wary of Western interference in their affairs.

Postwar Arab nationalism, instigated by individuals such as Egyptian Gamel Abdel Nasser and the Baath Party in Iraq and Syria, viewed Western interference in the Middle East as a threat to their power and sought agreements with the Soviet Union in order to counter Western economic domination. The Suez Crisis of 1956 in which the British, French, and Israelis attacked Egypt after Nasser nationalized the Suez Canal, was an illustration of Western reluctance to relinquish their claims in the region. Condemned by both the United States and the Soviet Union, this unsuccessful venture against Egypt illustrated to the Middle East states their vulnerability to Western aggression. Moreover, the Arab-Israeli conflict that followed the creation of the State of Israel in 1948 and the plight of subsequent Palestinian refugees has also generated Middle Eastern antagonism against the West, given its support of Israel and its expansion. U.S. military actions in the Middle East, such as the Gulf wars, the establishment of military bases (which some Islamist militants argue violate Muslim holy lands), and the onslaught of globalization in recent decades, have triggered further allegations of Western neocolonialism and ubiquitous resentment against the United States.

Neocolonialism in East Asia

Since 1945, neocolonialism in an East Asian setting was shaped by the gradual offshoring of light manufacturing of consumer goods from the developed world to this specific region. Postwar U.S., European, and later Japanese investment in the region, particularly in the Four Asian Tigers (Hong Kong, Singapore, South Korea, and Taiwan), in tandem with investments from their respective authoritarian governments, ensured that East Asia retained a prosperous yet dependent relationship with the developed world during this transitive period. Moreover, these four rising economic powers were able to create, in turn, neocolonial relationships with Indonesia, the Philippines, Malaysia, and Thailand (which, along with Brunei, formed the Association of Southeast Asian Nations, or ASEAN, in 1967). These countries supplied natural resources to the Four Tigers as the Four Tigers sought to develop their economies and partake in the offshoring and outsourcing of light manufacturing from the rust belts of the West. After 1979, China replaced the Four Tigers and ASEAN as a source of cheap labor, profitable investment, and abundant natural resources.

In the early 1960s, following Japan's economic miracle example, the Four Tigers embarked on an economic policy focused on export-driven industrialization. In exchange for capital investment from the developed world, the Four Tigers supplied cheap labor for the production of low-cost manufactured consumer goods. By undercutting Japan with cheaper versions of technological goods for global consumption, they ensured a viable flow of capital and raw materials that sustained their economic growth from the 1960s onward. This neocolonial relationship transitioned by the 1980s into one of mutual reliance.

The United States, Australia, and Canada shipped raw materials to these manufacturing centers for later export of manufactured goods and often ran trade deficits with the Four Tigers. Moreover, multinational corporations (MNCs) offshored their industrial plants to these sources of cheap labor while deindustrializing their production facilities in their home countries.

The ASEAN countries also developed a neo-colonial relationship with the Four Tigers as centers of low-cost natural resources to be exchanged for manufactured goods. By the late 1970s, they sought to wean themselves from this economic dependence and follow the example of the Four Tigers and engage in light manufacturing, particularly in the textile industry. Global economic downturns in the early 1980s and the ASEAN nations' growing international debt, while slowing their economies to some degree, ensured that they did not emerge as developed as had the Four Tigers. Indonesia, the Philippines, Thailand, and Malaysia, while developing industrially during this period, retained large peasant populations that lived in glaring poverty and subsistence in contrast to residents of urban economic zones.

The People's Republic of China also created an intricate form of neocolonial relationships with the developed world while preserving its communist state and ideology. After overtures of rapprochement and official recognition by the United States, China established coastal economic zones for offshoring and capital investment to develop light industry. Moreover, China was richly endowed in raw materials for its factories. The bustling Chinese economy was able to undercut Japan, the Four Tigers, and ASEAN while simultaneously creating economic relationships with these countries (relying extensively on the East and Southeast Asian Chinese diaspora). While the interior regions of China remained peripheral and rural in contrast with the prosperous coastal economic zones, they also retained a semicolonial relationship to the coastal manufacturing zones. As a technocratic-bureaucratic elite and highly skilled middle class developed in China, the rural interior remained under the tight grip of the state and vulnerable to famine and disease, not to mention economic downturns, illustrative of this colonial relationship.

➤ INTERNATIONAL FREE TIBET MOVEMENT

Following the end of the Chinese Civil War and the centralization of Chinese authority in Tibet in 1951, allegations of Chinese violence and human rights violations in the province of Tibet have incensed international critics and activists up to the present. Many internationally recognized celebrities and musicians have thrown their support behind the Tibetan cause, infuriating Chinese authorities who view the Tibetan situation as an internal matter. The celebrities hosting fundraisers and concerts in support of an independent Tibet include Paris Hilton, Richard Gere, and the Beastie Boys. The exiled Dalai Lama works as a symbolic figurehead of the movement, meeting with world leaders as well as major contributors to the Free Tibet Movement and its subsidiary and grassroots organizations. However, the People's Republic of China continues to deny any wrongdoing and purports that life in Tibet has improved due to Chinese investment in the region. Han Chinese immigration into the region and infrastructural investments have radically transformed Tibet in recent decades.

—Abraham O. Mendoza

Since the end of the Cold War and the acceleration of globalization, East Asian economies have remained competitive given their low costs of production and relatively cheap labor pools. However, other emergent world regions, as in the case of China, offer more attractive incentives for multinational corporations. Nonetheless, the interconnection of East Asian economies illustrates a complex neocolonial relationship centered on Japanese, European, and U.S. investments in the region, particularly through the financial nexus of Hong Kong. However, the rise of China in the past two decades is indicative of its own emergent economic (and military) hegemony in the Asia-Pacific region.

Neocolonialism in Central Asia

The geographical position of Central Asia and its composite republics (Kazakhstan, Turkmenistan, Uzbekistan, Kyrgyzstan, and Tajikistan), straddled between the Muslim Middle East, Russia, and China, has had a significant influence on its political, cultural, and economic destiny since the end of World War II. Under the direct political control of the Soviet Union until 1991, Central Asia since has become a sphere of economic and diplomatic contests among Iran, India, and Pakistan and to a greater extent among post-Soviet Russia, the People's Republic of China, and the United States. Due to Central Asia's immense wealth in terms of potential oil reserves, natural gas, and other extractable mineral resources, Western countries such as the United States and Japan have shown increased interest in developing relationships with the newly independent Central Asian republics, much to the dismay of Russia and China who see this region as their sphere of influence. The historical legacy of Islam in the region and the Turkic origins of the peoples of Central Asia as well as economic motives have also drawn the attention of Middle Eastern countries, principally Turkey, Iran, and Saudi Arabia. These multiple interests in the region create varying degrees of neocolonial influences among the various Central Asian states as global and regional powers compete for resources and meddle in these states' foreign and domestic policies. Scholars of neocolonialism would regard such economic and political influence (principally on the part of Russia) as neocolonial, as these nations attempt to extend their influence in the region at the expense of local interests.

Mostly under the rule of the Russian tsars from the eighteenth century until 1917, Central Asia continued under Russian political authority through the auspices of the Soviet Union until 1991. While the Soviets recognized distinct national minorities in Central Asia, they also discouraged Muslim religious identity when it conflicted with Soviet ideological objectives.

Nonetheless, Soviet authorities created five Soviet Socialist Republics (abbreviated as SSRs) (Kazakh SSR, Kirghiz SSR, Tajik SSR, Turkmen SSR, and Uzbek SSR) in recognition of the ethnic majorities of these states, which were part of the greater Soviet Union. Increased Russian immigration, in the form of engineers, bureaucrats, and professionals, created an ethnic Russian elite responsible for the day-to-day running of the political and economic life of the Central Asian republics. The local ethnic elites, mostly educated in Moscow and typically members of the Communist Party, had a nominal role as Soviet bureaucrats, while the vast majority of the population worked in laboring professions such as agriculture, mining, and construction. Much of the investment in Central Asia under Soviet authority was geared toward the extraction of resources and their redistribution to the Russian Soviet Federated Socialist Republic (RSFSR). While much of the investment in Central Asia did come from the RSFSR most of the wealth returned to the RSFSR, leaving little industrial development in the fringe Central Asian SSRs. This investment also created a huge infrastructure of railroads, electrical grids, waterways, and pipelines that tied this region economically to the entire Soviet Union.

With the dissolution of the Soviet Union in 1991 and its replacement with the Commonwealth of Independent States (CIS) to ease the transition into the post-Soviet era, the Central Asian republics emerged as the independent nation-states of Kazakhstan, Turkmenistan, Uzbekistan, Kyrgyzstan, and Tajikistan. The expressed conciliatory tone of cooperation, heavily endorsed by the Russian Federation, masked Russian interest in maintaining economic control of the region after 1991. Given the high density of Russian population in the former Soviet Republics in what is known to Russians as the near abroad, the Russian government privileged ethnic Russians in Central Asia through double citizenship and pressuring their host governments on their behalf.

Through the 1990s to the present, the Central Asian republics began establishing trade with other regional powers in an effort to develop their national economies. The People's Republic of China had shown immense interest in the Cen-

tral Asian region since the 1970s given the ethnic composition of its Xinxiang Province (Turkic people of Central Asian heritage) and concerns over potential ethnic strife just over the border. China was also well aware of the wealth of natural resources of the region. India wished to extend economic assistance and investments into the region in order to expand into a potential market, previously untapped, for Indian goods. The Middle Eastern countries of Iran, Iraq, and Saudi Arabia also began to show interest in the region, given its newly free large Muslim populations and also the potential to develop pipelines in the region extending into the Persian Gulf. Turkey, with its historic cultural and linguistic ties to the Turkic republics, also created greater linkages with some of the Central Asian republics. Islamic fundamentalists from Pakistan and Afghanistan sought to spread their ideological message, creating a breeding ground for fanatical militias in the borderlands of Tajikistan and Afghanistan.

After the terrorist attacks of September 11, 2001, in the United States, the United States became directly engaged in Central Asia after establishing a base of operations in Uzbekistan for NATO forces fighting al-Qaeda and Taliban fighters in Afghanistan. The U.S. presence worried Russia, China, and Iran given their own interests in tapping Central Asian oil and natural gas supplies. Russia and China, in the hopes of countering U.S. (and Japanese) oil interests in the region, have created diplomatic links with Iran and India in efforts to ensure their economic influence in Central Asia. However, given that all of these regional powers have different objectives (cultural, ideological, economic, military, and religious) in Central Asia, it is unclear whether such cooperation is at all possible. The destinies of the Central Asian republics remain largely at the whims of their more powerful neighbors; yet these countries may maintain autonomy, to some extent, by pitting the larger powers against each other.

➤ GEOPOLITICS AND THE CENTRAL ASIAN PIPELINE

Russian president Vladimir Putin (center) shakes hands with the president of Turkmenistan Gurbanguly Berdimukhammedov (right) and president of Kazakhstan Nursultan Nazarbayev (left) during their negotiations on a landmark gas pipeline in the town of Turkmenbashi on May 12, 2007. (Mikhail Klimentyev/AFP/Getty Images)

In May 2007, Russian president Vladimir Putin signed an accord with the presidents of Kazakhstan and Turkmenistan that ensured the construction of a gas pipeline linked directly to Russia from these two Central Asian republics. This agreement allowed the creation of a transcontinental pipeline around the Caspian Sea, giving Russia direct control of significant amounts of Central Asian natural gas reserves. Russia's domestic supply of natural gas is sold domestically through the country's gas monopoly Gazprom at subsidized prices. However, Gazprom plans to sell Central Asian gas to Europe for almost double the price. This agreement is a setback to U.S. and European Union efforts to create a pipeline for Central Asian natural gas that might flow directly to Europe without Russia in a position of control. Gazprom, known for its accumulation of gas and oil concerns in Russia and the former Soviet Union, is suspected of attempting to corner the European gas market, subjecting consumers to its whims in the near future. This pipeline deal is a reflection of the neocolonial ambitions of Russia in the former Soviet Central Asian republics, much to the dismay of China, India, and the United States, also hoping to develop their own pipelines in the region.

Neocolonialism in Latin America

Since 1945, most of Latin America maintained a neocolonial relationship to the United States, particularly in terms of diplomatic and economic policies that benefited the latter. In the context of the global Cold War, U.S. foreign policy vis-à-vis Latin America regarded this world region as pivotal to its security. The emergence of a Soviet-backed communist regime in Cuba under Fidel Castro (1959) and the subsequent Cuban Missile Crisis (1961) illustrated to U.S. policy makers that Latin America was potentially vulnerable to Soviet machinations. This led to a series of U.S. Central Intelligence Agency (CIA) covert operations in Latin America to support anticommunist dictatorial regimes, the most overt example being Chile and the ouster of Salvador Allende (1973).

In the late 1950s and early 1960s, U.S. policy in Latin America favored a conciliatory approach in terms of developing a cooperative continental foreign policy in the context of the Cold War. The Alliance for Progress, initiated in 1961, was a U.S. policy geared at establishing economic cooperation in the Americas as a means to counter perceived Soviet ambitions in the region after the establishment of the Castro regime in Cuba. Through the Organization of American States, the United States and Latin America cooperated on foreign policy issues in the Caribbean and South America, most notably in the intervention in the Dominican Republic in 1965. However, the conciliatory approach of the Alliance for Progress for social reform and economic development was scrapped by President Lyndon Johnson's administration in favor of direct intervention to suppress communism in the region, which was a policy also followed by President Richard Nixon in the 1970s. Support for right-wing authoritarian dictators and military juntas (Brazil, Chile, Uruguay, and Argentina) and one-party dictatorships (Mexico) by the United States

maintained its diplomatic and military hegemony in the region, albeit with growing anti-U.S. resentment.

Latin America was seen as a stable region, and Western banks sought to invest in regional industries, ultimately encouraging runaway Latin American debt. Latin American economies, particularly from 1960 to 1973, grew at astonishing rates in relation to the rest of the developing world, at nearly 6 percent. Much of this growth was a result of export-driven foreign trade of manufactured goods in addition to their traditional dependence on commodities (cash crops, minerals, and other extraction industries). U.S. banks, fueled by growing stocks of petrodollars coming from the oil-rich Middle East, invested billions in Latin America. The foreign debt of Latin America grew from \$2.3 billion in 1970 to \$340 billion by 1983, accounting as a region for roughly 60 percent of the world's foreign debt owed to commercial banks. During the global recession of the late 1970s and early 1980s, most of Latin America was heavily indebted and, with most banks calling in their loans, was already hard-pressed amid the economic hardships of this period. The resultant Latin American debt crisis led to increased U.S. involvement in state spending through the auspices of the International Monetary Fund (IMF) to reschedule and restructure debts. Argentina, Brazil, Mexico, and Peru, among others, were forced to cut social programs and reserve a large amount of their revenues from taxation and nationalized industries (such as oil) toward servicing their debt. Moreover, U.S. anticommunist foreign policy in the Central American republics of Nicaragua and El Salvador and the Caribbean state of Grenada in the 1980s to combat Soviet-supported insurgents also contributed to ever-growing Latin American resentment to U.S. hegemony in the region.

With the end of the Cold War, most of Latin America embraced neoliberal free market policies to lessen their dependence on the United States. With the development of the North American Free Trade Agreement (NAFTA) between Canada, the United States, and Mexico, the South American republics of the Southern Cone developed Mercosur (Mercado Común del Sur) as a means to develop their economic independence from the West. During this period, the transition

of right-wing dictatorships to popularly elected liberal and socialist governments, particularly in Argentina, Brazil, Chile, Peru, El Salvador, and Guatemala, drastically altered relations with the United States. Moreover, Venezuela's Hugo Chavez and Bolivia's Evo Morales have currently used anti-U.S. rhetoric to shore up their socialist control over their respective states. Chavez, in particular, in his support of Cuba, diplomatic exchanges with Iran, and joint military exercises and purchase of war materiel from Russia, takes a more aggressive stance against the United States in world affairs. Brazil, as South America's largest economy and an integral member of Mercosur, now stands to emerge as one of the largest world economies in the twenty-first century.

Nonetheless, the United States still maintains asymmetrical relations with Mexico and Colombia, given their dependence on the U.S. economy and financial assistance in fighting international drug cartels.

■ Introduction: Creation of New States

With the end of the European empires and the fragmenting of the Soviet Union into its composite national states, the world has experienced the widespread creation of new independent states from 1945 into the present. The postwar reconfiguration of boundaries in Europe and East Asia along Cold War ideological lines led to the division of Germany, Korea, and Vietnam. At the same time, most of Eastern Europe and the Baltic came under the Soviet yoke. Vast regions of Africa, Asia, the Middle East, Oceania, and the Caribbean attained independence amid the process of European decolonization. Furthermore, with the collapse of the Soviet Union, the reunification of Germany, and the breakup of Czechoslovakia and Yugoslavia into myriad national states, there was a massive proliferation of new polities that soon gained membership into the United Nations. Such transitions were not necessarily smooth. In many of these regions, disputes over national boundaries and ethnic identity triggered separatist movements, civil wars, regional conflicts, ethnic cleansing, and the development of failed states. In the post-Cold War world, geopolitical and strategic concerns on the part of major world powers, such as the United States, Russia, China, and the European Union (itself a new suprana-

tional entity), also have a significant influence in the establishment (and in some cases contraction) of these new polities.

—Abraham O. Mendoza

Tito's Yugoslavia

Born on May 7, 1892, in Kumrovec, Croatia, to a peasant family that farmed eight acres, Josip Broz was the 7th of 15 children, only 7 of whom survived childhood. In 1915, while serving in the Habsburg Army, he was captured by the Russians. He remained in Russia during the revolutions of 1917 and the ensuing Russian Civil War, although the extent to which he participated in these conflicts is unclear. In 1920 he returned to the Kingdom of Serbs, Croats, and Slovenes (after 1929, Yugoslavia), which had been created in 1918. Imprisoned from November 1928 until March 1934 for political activism, he worked for the Comintern from 1935 until 1940, taking the name Tito. In the late 1930s, he became the secretary general of the small Yugoslav Communist Party. In the fall of 1941, Tito's Partisans began their struggle against the Axis occupation of Yugoslavia and also against the Serbian nationalist (Chetnik) resistance. Gradually mastering the art of guerrilla warfare, the Partisans liberated parts

of Slovenia, Croatia, Bosnia, and Macedonia late in 1943, aided considerably by the collapse of fascist Italy. On October 20, 1944, they captured Belgrade. Despite the hatred generated by violence and reprisal among Yugoslavia's ethnic groups, in March 1945 Tito created a new Yugoslav state. Formally a federation of six republics—Serbia, Croatia, Slovenia, Montenegro, Macedonia, and Bosnia-Herzegovina—in actuality Yugoslavia would remain a unitary state governed by Tito and the Communist Party.

A dedicated Stalinist, Tito began to nationalize property, hoping to industrialize his country quickly, but in 1948, angered over Tito's efforts to aid the Greek communists and create a Balkan federation independent of Soviet control, Stalin expelled Yugoslavia from the Soviet-dominated Cominform and imposed a damaging economic embargo. Shunned by the man he had idolized, Tito gradually retreated from the Soviet model. The drive to collectivize farmland, launched in 1949, was abandoned by 1951. In 1953 peasants were allowed to leave the collectives, although private farms of more than 10 to 15 hectares were not permitted. Likewise, beginning in 1950, workers were given more authority to select their enterprise managers. As Tito moved toward market socialism, Yugoslavs came to enjoy a higher standard of living and greater freedom than their Soviet Bloc neighbors. Titoism became an attractive communist alternative to the more rigid and bureaucratic Stalinist model.

Along with Jawaharlal Nehru of India and Gamal Abdel Nasr of Egypt, Tito spearheaded the Nonaligned Movement, which encouraged developing nations to maintain independence from and good relations with both the Soviet Union and the United States during the Cold War. In 1955, as a sign of Tito's growing stature, especially in the Soviet Bloc and the developing world, Soviet premier Nikita Khrushchev publicly apologized to Tito for Stalin's harsh actions toward Yugoslavia. In 1968, Tito condemned the Soviet invasion of Czechoslovakia, again emphasizing his maverick status.

In the 1970s, as Yugoslavia opened up to global market forces, political power devolved more and more to the separate republics. In the north, relatively prosperous Slovenia and Croatia objected to financing development of the poorer

south. Tensions mounted in Kosovo, an autonomous region in southern Serbia that the Serbs regarded as the cradle of their civilization. However, Albanians now comprised 80 percent of Kosovo's population, and some began to call for separate republican status. On May 4, 1980, after 35 years in power, Tito died, leaving behind an ineffective collective presidency that rotated annually among the presidents of the six republics and the autonomous regions of Kosovo and Vojvodina. Economic woes and Mikhail Gorbachev's decision to allow the Soviet satellites to renounce communism and go their separate ways further accelerated the disintegration of Yugoslavia, which began with Slovenian and Croatian declarations of independence in 1991. The civil war that followed ultimately led to economic sanctions, NATO military intervention, and internationally brokered peace agreements.

Post-Soviet Eastern Europe

The territorial dissolution of the Soviet Union, along with the withdrawal of Soviet troops from Eastern Europe and development of a market economy, constitute the common historical background faced by the post-Soviet East European countries from Estonia to Bulgaria in the late 1980s and the early 1990s. Remarkably, the post-Soviet East European countries achieved widely varied forms of democratization, economic reform, and civil peace. In the early 1990s, the Baltic States (Estonia, Latvia, and Lithuania), the Visegrad group (Poland, Czech Republic, Slovakia, and Hungary), and Slovenia rapidly achieved high levels of democratization, economic growth, and national unity, while the Balkan States (Bulgaria, Romania, Serbia and Montenegro, Croatia, Bosnia-Herzegovina, Macedonia, and Albania) and the former Soviet republics of Belarus, Ukraine,

BREAKUP OF THE SOVIET UNION, 1989–1995

➤ GREATER SERBIA

While the concept of establishing a Greater Serbia has deep historical roots, the concept gathered new momentum within Serbia during the mid-1980s. This nationalistic concept, emerging from the Pan-Slavic ideology, promoted political unification of Balkan lands inhabited by Serbs, to the detriment of non-Serbian populations including the Albanians, Croats, and Bosnians. The concept played an important role in Serbia's foreign policy during two Balkan wars fought in 1912 and 1913, when Serbia made territorial gains by absorbing Kosovo and part of Macedonia but failed in its objective of uniting with Serbian regions of the Hapsburg empire, including parts of Bosnia-Herzegovina, Croatia, and Vojvodina. Furthermore, the Hapsburg annexation of Bosnia-Herzegovina in 1908, which delivered a major blow to the Greater Serbia concept, greatly contributed to the rise of the nationalistic sentiments in Serbia and, eventually, to the assassination of Archduke Franz Ferdinand and the start of World War I in 1914. After the war, the concept paved the way for the establishment (1919) of the Kingdom of the Serbs, Croats, and Slovenes, named Yugoslavia from 1929. Paradoxically, this same concept contributed to the disintegration, in the early 1990s, of the very country it had done so much to create.

From the mid-1980s, Slobodan Milosevich (1941–2006), the communist leader of Serbia—one of six republics making up Yugoslavia—became a proponent of Greater Serbia. Support for this idea led to repression of ethnic Albanians in Serbia's Kosovo province (1989). With non-Serbian populations under threat, the republics of Slovenia (1991), Croatia (1991), and Bosnia-Herzegovina (1992) declared their independence. Civil war followed, marred by instances of horrific ethnic cleansing that the Serb-dominated Yugoslav National Army perpetrated, particularly in Bosnia. International intervention in 1995 produced an uneasy peace settlement and the charging of Bosnian Serb leaders with crimes against humanity.

These actions came too late to save Yugoslavia. Destroying Yugoslavia and simultaneously promoting ethnic cleansing, the concept of Greater Serbia epitomized the violent nationalism afflicting the globe since the end of the twentieth century.

—Bruce DeHart

Bibliography

Sell, Louis. *Slobodan Milosevich and the Destruction of Yugoslavia*. Durham, NC: Duke University Press, 2002.

and Moldova accomplished less in terms of democratization and economic reform, and many of them were threatened by ethnic conflicts.

Prior to the breakup of the Soviet Union, some of these countries had developed anticommunist political movements with a mass following, such as Solidarity in Poland and the Sajudis movement in Lithuania. In these countries, the communist leadership gradually—but completely—conceded power to the anticommunists. In many other countries there was continuity between the communist and postcommunist political and economic elites. Such was the case in Serbia and Montenegro. These countries, under the name Yugoslavia, continued to be headed by Slobodan Milosevic in the postcommunist era, although Milosevic turned to an ethnic (Serbian) nationalist mobilizing ideology. In yet other countries a rapid collapse of the communist re-

gime only briefly gave way to an opposition movement that was, once again, taken over by formerly communist cadres. The most spectacular example of such a regime collapse occurred in Romania, where Nikolai Ceausescu's personal dictatorship fell in a popular uprising, to eventually be replaced by a coalition of mostly communist-era political elites with some members of the democratic opposition.

Starting with the unification of East and West Germany, Europeanization has been an important focus of the last two decades in the region. It is in this region that the European Union (EU) launched the most ambitious expansion in its history, accepting ten formerly communist states from Estonia by the Baltic Sea to Slovenia by the Adriatic in 2004 and shortly thereafter reaching the Black Sea by accepting relatively poor Romania and Bulgaria in 2007. The EU ex-

erts substantial influence over the domestic politics of East European countries, exemplified by the popular rejection of the Slovakian prime minister Vladimir Meciar following the EU's policy to exclude Slovakia from membership as long as Meciar remained in power.

Rapid political and economic reform and development on the northwestern corner of the region soon created the image of a bifurcated Eastern Europe with a deep chasm between its developed and underdeveloped halves. Social scientists and pundits alike commented that this rapid divergence of developmental trajectories in Eastern Europe reflected a purportedly historic civilizational divide between the predominantly Catholic and Protestant (Western Christian) states on the one side and the predominantly Orthodox and Muslim states on the other. The early 1990s lent credence to these theories, when Estonia, Latvia, Lithuania, Poland, Czech Republic, Slovakia, Hungary, and Slovenia, all of them Catholic and Protestant, were slated for the next enlargement of the EU, which occurred in 2004, due to their impressive record of political and economic reform.

However, by the end of the 1990s, democratization started to take root in the southeastern half of the region as well, thus upsetting the seemingly bifurcated nature of political and economic development. Bulgaria and Romania advanced rapidly in terms of political and economic reform after the election of fervently anti-communist leaderships in the second half of the 1990s, and as a stamp of their progress, both countries became EU members in 2007. Croatia also made major democratic advances and is expected to be the next country to join the EU, while Macedonia entertains similar hopes. Serbia after the fall of Milosevic in 2000 and Ukraine after the election of Viktor Yushchenko in 2004, also moved toward democracy. Belarus under the iron grip of Aleksandr Lukashenko remained the sole dictatorship in the region, with a poor level of civil and political liberties comparable only to countries such as Saudi Arabia and Laos.

Despite this picture of democratic progress overall, ethnic tensions in Eastern Europe also led to one of the darkest moments in European history in this period. The genocide against Bosnian Muslims took place during the most horrendous

war in Europe since World War II between the Serb, Croat, and Bosnian Muslim forces. The threat of another ethnic cleansing by the Serbian authorities against Kosovo Albanians was the justification for a NATO operation against Serbia, which put Kosovo under United Nations protection. Ethnic polarization between Albanians and Macedonians in Macedonia was diffused partly through the efforts of the EU to prevent a potential breakup of another former Yugoslav state. A Russian-speaking enclave in Moldova enjoyed de facto independence from the Moldovan government since the breakup of the Soviet Union, while the treatment of and demands by the Hungarian minorities in Romania and Slovakia occupied an important place in these countries' agendas. Despite the pessimistic expectations to the contrary in the 1980s, however, the sizable Turkish minority in Bulgaria entered into a political power-sharing agreement through various coalition governments, and another potential ethnic conflict was averted.

In conclusion, despite the wide variation in terms of democratization, economic reform, and ethnic relations summarized above and despite selective incorporation of some East European countries into Western Europe through EU expansion, there remain political, economic, and social features that are common to the entire region from eastern Germany to Bulgaria, such as the overall weakness of civil society and the still remarkable degree of economic equality in these societies compared to other major regions in the world. Both of these features indicate continuity with the region's communist legacy, since during communist rule civil society was thoroughly suppressed, while economic equality was a prime goal of state policy.

Post-Soviet Central Asia

The five formerly Soviet Central Asian republics—Kazakhstan, Uzbekistan, Kyrgyzstan, Tajikistan, and Turkmenistan—are distinguished from the other ten Union republics in the European territories of the former Soviet Union in that they became independent in 1991 even though neither the political leadership nor the public demanded independence. The independence of the Central Asian republics occurred as a by-product of the dissolution of the Soviet Union in Europe. Compared to the Baltic or the Caucasian republics, there were hardly any demonstrations in favor of independence in Central Asia. Both the political leadership and the population (the latter through the referendum on the new Union Treaty) signaled their willingness to stay within the same political framework with Russia and any other republics that wanted to remain in a reformed Soviet Union. However, President Boris Yeltsin and the Russian leadership in Moscow rejected the Central Asian leaders' demands to remain part of a new federation since they were at least partially convinced that Central Asia was a burden on Russia economically while also posing a demographic threat to the already tenuous Russian majority in the Soviet Union due to the above-average population growth in Central Asia.

Eighteen years after the collapse of the Soviet Union, Central Asia is still marked by a stunning continuity in communist-era leadership characterized by personalistic dictatorships and a lack of any substantive political reform toward democratization or economic reform toward free market economics. Uzbekistan and Turkmenistan consistently rank as the most undemocratic states in the world, in the same league as North Korea, Cuba, and Syria. Communist Party chiefs Nursultan Nazarbayev of Kazakhstan, Islam Karimov of Uzbekistan, and Saparmurad Niyazov of Turkmenistan remained the leaders of these countries into the twenty-first century. Niyazov

of Turkmenistan, who died in 2006, renamed himself Turkmenbashi (the head of the Turkmen) and created a most complete and anachronistic personality cult, reminiscent of the Stalinist period.

Tajikistan, under the iron grip of Emomali Rahmonov since 1992, was alone among the five Central Asian republics in experiencing a long and bloody civil war between the communist-era party clique, heavily dominated by the Uzbek minority in the country, and the anticommunist forces during which the democratic opposition represented by the United Tajik Opposition (UTO) was defeated. Kyrgyzstan is the only country in post-Soviet Central Asia where the communist-era leader, Askar Akayev, was replaced by a democratically elected leader, Kurmanbek Bakiyev, after the elections of March 2005 through the so-called Tulip Revolution.

Consistent with the authoritarian stability of political leadership and a lack of economic reform in this area has been the stability of the ethnic national borders that Stalin drew in Central Asia in the 1920s. After Soviet control was established in Central Asia, which was previously the province of Turkestan, the region was divided into five ethnic republics, consistent with Lenin's and Stalin's idea of ethnic-national rights to self-determination. The right to self-determination remained a fiction, as none of the republics were ever allowed to secede from the Soviet Union, but the legacy of dividing this predominantly Muslim and Turkic-speaking (except Tajikistan) region into five republics proved to be decisive for the future of the region.

Many thought these borders to be artificial, and some even expected them to wither away in a drive to unify at least the four Turkic-speaking republics (all except Tajikistan). Not only is there no sign of regional integration, but the mono-ethnic nation-building projects of the five republics systematically pushed groups other than the titular ethnic group out of these countries, most notably Russians, other Slavs, and Europeans such as Germans, Crimean Tatars, and the Meshketian Turks living in Central Asia. Nationalizing policies led to a few popular clashes in ethnically mixed and densely settled regions such as the Ferghana Valley, which is situated at the intersection of Uzbekistan, Kyrgyzstan, and

Tajikistan although most of the valley belongs to Uzbekistan.

Although every republic contained sizable Russian and other minorities in 1991, in the course of the 1990s these minorities, especially the Russians, began to leave Central Asia. Kazakhstan presents the most spectacular example of this process, where at the time of independence only 41 percent of the population was Kazakh, another 40 percent was Russian, and Germans and Koreans, for example, each made up 3 percent of the population. By 2006 the Russian share of the population declined to 30 percent, while the Kazakh share of the population rose to 53 percent, hence establishing the absolute majority of the Kazakhs in Kazakhstan. This is the result of the 15 years of nation-building efforts.

Geopolitically, Turkey was expected to play a major role in the region as a pro-American liberal democracy with close linguistic, cultural, religious, and historical ties with the Turkic-speaking republics of Central Asia. Despite the outpouring of official visits, academic exchanges, international conferences, cultural programs, and some important economic investments, Turkey by and large failed to fulfill this role. Turkey's efforts proved to be too weak when confronting Russia, China, and other powers seeking to maintain or gain influence in the region. Russia and China established the Shanghai Cooperation Organization to stabilize the country's influence in the region and shore up the current dictatorships. Iran and Pakistan emerged as other important players in the region. The leadership of Kyrgyz and Uzbek tried to diversify their international support by allowing the United States to establish military bases in Kyrgyzstan and Uzbekistan, although Uzbek-U.S. relations were strained after Karimov's suspicion that the U.S.-based democracy promotion agencies were trying to topple his regime.

Post-Cold War East Asia

East Asia entered a new era following the end of the Cold War. Russian involvement in the region declined significantly after the collapse of the Soviet Union. The end of the Cold War, however, did not result in the fall of the Chinese Communist Party (CCP). The People's Republic of China (PRC), after a decade of reform in the 1980s, continued with economic reform to develop into one of the world's fastest growing economies. Japan's economic success declined at the beginning of the 1990s, and all of the Asian Tiger economies suffered in the East Asian financial crisis of 1997. In the 1990s and 2000s there has been political liberalization throughout the region. Security issues regarding the Korean peninsula and Taiwan remain.

In South Korea, Kim Young-sam became the country's first nonmilitary president in more than thirty years on December 18, 1992. Kim launched a drive against corruption and announced a series of new policies to reform the South Korean economy. These measures were considered a success, although the issue of corruption has returned to Korean headlines since 2000. American troops continue to be stationed in South Korea following the end of the Cold War. In 1998 President Kim Dae-jung formulated the Sunshine Policy, a new South Korean diplomatic approach to North Korea that emphasized economic and political interaction and led to the first North-South summit on the Korean peninsula in history in June 2000. The meetings led to cross-border collaborations such as the Kaesong Industrial Region in North Korea, but relations have dramatically cooled since the North Korean missile launch of 2006 and later tests, including one in 2009.

In North Korea, Kim Il-sung died on July 8, 1994, to be succeeded as head of state by his

► CHINA'S INTERNET—GOLDEN SHIELD OR GREAT FIREWALL?

Access to the Internet is controlled in China by more than 60 Internet regulations and various local censorship systems. The Great Firewall of China, or the Golden Shield as it is known within China, blocks outside content from local Internet access by preventing IP addresses from being routed through and into the system. Content that offends Chinese authorities will often deal with topics considered taboo, such as police brutality and freedom of speech. Specific Web sites, such as BBC News (www.bbc.co.uk) and Yahoo! Hong Kong (hk.yahoo.com), are blocked. Organizations considered controversial such as Falun Gong or the International Tibet Independence Movement are also blocked. Internet access in China is increasingly common despite the controls on content. The Chinese government issued licenses to ten firms to open Internet café chains on July 11, 2003.

Criticism of Chinese policy on Internet controls centers on human rights issues and the denial of free information to millions of Chinese. This has not prevented Western companies from dealing with the Chinese; in February 2006 the search engine Web site Google.com agreed to block Web sites that the Chinese government considered illegal in exchange for equipment installation in China. In August 2006 online retailer Amazon.com announced its intention to buy Chinese online retailer Joyo.com in a deal worth approximately \$75 million.

—John Harney

son, Kim Jong-il. The succession did not bring reforms, and the economic difficulties of North Korea's isolation were exacerbated by the loss of guaranteed markets in the Soviet Union and China. During the 1990s North Korea's economy became reliant on international aid to feed its population, but military expenditure did not diminish, and the army continues to maintain a force of one million soldiers. The North Korean government keeps tight control over the civil liberties of its citizens and their access to foreign sources of news and information. China is North Korea's closest ally; however, the North Koreans

have experienced none of the economic success transforming China and exhibit no obvious signs of political evolution within the country. As of 2009, Kim Jong-il was reported in poor health, and the increasingly isolated nation continued to develop a nuclear weapons program despite international pressure.

In Japan, the bubble economy of the 1980s that peaked in 1989 and represented a high point in the dramatic and transformative economic growth in Japan since the 1950s had by 1991 come to an end. The Heisei period (beginning on January 8, 1989, and lasting until the present day of 2009) has been a period of price deflation and lethargic gross domestic product (GDP). The Liberal Democratic Party (LDP) lost power in 1993 for the first time in 38 years but returned 3 years later in 1996 with Tomiichi Murayama as prime minister. The LDP continues to dominate Japanese politics. Koizumi Junichiro had proved to be a charismatic and controversial Japanese leader. He supported a larger role for the Japanese military, and in 2003 Japan sent 1,000 soldiers to Iraq to aid in reconstruction of the country. Koizumi also played a part in the inflammation of negative opinion in China by making yearly visits to the Yasukuni shrine, where several Japanese war criminals are interred. Shinzo Abe replaced Junichiro Koizumi as prime minister in 2006 and was succeeded by Taro Aso in 2008. No political leader has yet emerged to rival the popularity and international recognition of Koizumi. In recent years the Japanese economy has failed to return to its globally pre-eminent status of the 1980s, particularly in the face of dramatic Chinese economic growth.

Taiwan held its first direct presidential elections in 1996 after 47 years of authoritarian rule. The Guomindang (GMD) party, first under Chiang Kai-shek and later his son Chiang Ching-kuo, had been in power since the end of the Chinese civil war in 1949. The communist PRC government conducted missile tests in the Taiwan Straits during the election period in an attempt to intimidate the Taiwanese electorate and increase the chances of candidates in favor of reunification with Mainland China. Despite this tactic, the GMD leader and incumbent president Lee Teng-hui defeated Democratic Progressive Party (DPP) candidate Peng Min-Ming. In response to

the Chinese missile tests, the United States dispatched two aircraft carrier battle groups to the region. This series of events, collectively titled the 1996 Taiwan Straits Crisis, came at the end of a long period of political liberalization in Taiwan that saw the rise of an opposition party (the DPP) and increased tolerance for the development of a Taiwanese ethnic and political identity separate from the mainland.

Taiwan has had three presidential elections—in 2000, 2004, and 2008—since the 1996 Taiwan Straits Crisis. The PRC refrained from provocative actions but continued to support candidates in favor of reunification with China. Chen Shui-bian, leader of the DPP, was elected president in 2000 and 2004. Taiwan's democratic system has remained intact despite controversy over the 2004 election results. GMD candidate Ma Ying Jiu successfully assumed the presidency of Taiwan in 2008. Doubts remain within Taiwan concerning the long-term relationship with Mainland China and the future of the Taiwanese economy. Desire within Taiwan for formal independence, particularly among DPP supporters, continues to provide a threat to regional security.

On July 1, 1997, the British government handed Hong Kong over to the PRC. Political liberalization had also been taking place in Hong Kong, as British governor Chris Patten introduced democratic reforms in the years leading up to the handover. Hong Kong became a Special Administrative Region (SAR) of the PRC, under the One Country, Two Systems policy developed by Deng Xiaoping. Border controls between Hong Kong and the PRC were not relaxed. Hong Kong remained a separate customs territory, retaining membership in international organizations such as the World Trade Organization. The PRC appointed Tung Chee Hwa as the first chief executive of Hong Kong. Since then, Hong Kong has often been the site of popular protest against the Chinese government.

North Korea remains a security issue. U.S. president George W. Bush, following the September 11, 2001, attacks, identified North Korea as part of an "Axis of Evil" alongside Iraq and Iran. Security issues regarding North Korea hinge on the development and use of nuclear weapons. On January 10, 2003, North Korea withdrew from the Nuclear Non-Proliferation Treaty, and

on October 9, 2006, the North Korean government announced the successful test of its first nuclear weapon. This pursuit of a nuclear program in the face of international pressure has become a major international concern. The international community's understanding of living conditions for the North Korean populace remains limited. Pyongyang has persisted in aggressive behavior, announcing a further missile launch in 2009. In July 2009 North Korea fired a series of cruise missiles into the Sea of Japan, actions widely perceived as a show of defiance against the United Nations. The traditionally close relationship between North Korea and China and North Korea's hostility toward South Korea and Japan have placed added pressure on East Asian countries for increased political cooperation.

The Creation of Israel and the Reconfigured Middle East, 1945–1949

If World War I and its aftermath permanently altered the regional politics of the Middle East, then the half-decade following World War II drastically rearranged both the domestic and international politics of the Middle East. The most notable changes in the Middle East during this five-year period were the founding of the State of Israel and the accompanying Palestinian refugee problem. These events sent shockwaves through the Middle East, affecting both the internal stability of neighboring Arab governments and their nations' dispositions vis-à-vis the developing Cold

War between the United States and the Soviet Union.

Prior to World War II the leaders of the Zionist movement concentrated on gaining great power support for their endeavor and persuading Jews (mostly European) to move to Palestine. The Zionist leadership succeeded for a while in accomplishing both goals, as the British granted steady support, both verbal and material, to the Zionist movement in Palestine during 1917–1939. In 1939, however, the British reversed course in the aftermath of the Palestinian Revolt (1936–1939) and the beginning of World War II, concluding that their imperial and national interests required greater Arab rather than Zionist support. During World War II mainstream Zionist organizations in Palestine aided the British in their fight against Nazi Germany but continued to plan for a future state.

Following World War II the Zionist leadership concluded that the British had become permanently anti-Zionist and began a guerrilla war against the British presence in Palestine. The mainstream Zionist military force, the Haganah, joined with the more right-wing Stern Gang and Irgun and attacked British targets, most notably the King David Hotel in Jerusalem in 1946, killing close to 100 people including British soldiers and civilians. Although the British effectively put down most of this revolt with mass arrests and retaliatory strikes, their leadership in London, under major financial and political stress, decided to confer with the United States on how to proceed. The result was the Anglo-American committee of inquiry, which eventually advocated a binational state in Palestine. The Truman administration, however, ignored this committee's recommendations, and the British subsequently referred the matter to the United Nations (UN). On November 29, 1947, under pressure from Americans lobbying on behalf of the Zionist cause, the UN General Assembly voted to partition Palestine into separate Jewish and Arab countries with Jerusalem as an independent, international city.

Believing that something was better than nothing, David Ben-Gurion, the elected leader of the Zionist movement, convinced his colleagues to accept partition, while the Palestinian Arab movement, under the leadership of Hajj Amin

al-Husseini, rejected partition. The recently established League of Arab States, a union of six Arab states, also rejected partition and announced its intention to ensure that such an outcome would not come to pass. The partition vote set in motion the countdown to a regional war between the Zionists and the surrounding Arab states once the British were scheduled to depart from Palestine in May 1948.

The civil war that erupted in Palestine between Zionist and Arab forces following the UN vote on partition fundamentally altered the demographics of Palestine. While armed Palestinian Arab forces enjoyed some success in separating Jewish areas in the eastern parts of Jerusalem from the major Jewish settlements near Tel Aviv and along the coast, by April the Zionist forces, led by the Haganah, went on the offensive. The Haganah implemented Plan D, which called for the conquest of entire Arab villages. Zionist victories and occasional harassment of conquered Palestinian Arabs convinced many wealthy Palestinians, including much of the leadership, to flee to neighboring countries. The exodus of Palestinian leaders combined with rumors of Zionist atrocities (several did occur) against conquered Palestinian Arabs touched off a wave of fear among the general Palestinian population that led to thousands of Palestinians following their leaders into exile. By May 1948 the Zionist forces had won the civil war, and hundreds of thousands of Palestinians had fled the Jewish-controlled areas of Palestine. The number would surpass 700,000 by the end of 1948.

On May 14, 1948, immediately following the termination of the British Mandate, Ben-Gurion announced the founding of the State of Israel. Five Arab nations—Egypt, Syria, Lebanon, Jordan, and Iraq—immediately invaded Palestine. While the Israelis were poorly equipped because Western powers refused to provide them with arms, during the early phase of the conflict they enjoyed superior numbers and coordination compared to their adversaries. The Arab nations, although better armed, could not agree on one strategy, as Jordan, Egypt, and Iraq all had national goals in the conflict. In fact, one prominent Israeli scholar has argued that Jordan abided by a previous agreement with pre-state Zionist leaders, which emphasized that Jordan and Israel

would divide Mandate Palestine among themselves. Thus the Jordanian Legion, the most powerful Arab military force at the time, concentrated on securing its control over the eastern parts of Palestine, including eastern Jerusalem, and did not engage in offensive military actions in the parts of Palestine awarded to the Zionists by the UN partition vote.

During a short-lived truce in the summer, the Israelis received arms shipments from Soviet-allied Czechoslovakia. After Egypt violated the truce, the Israelis, with superior organization and planning and now with equal weaponry, went on the offensive and by the end of 1948 had secured for themselves 78 percent of Mandatory Palestine, far more than they had been granted by the UN partition. Furthermore, Jordan occupied the entire eastern part of Palestine, and Jerusalem, rather than becoming an international city, became a divided city with the Israelis in control of the western part and the Jordanians in control of the eastern part.

In the winter and spring of 1949 Israel negotiated truces with the Arab states on the Island of Rhodes, under UN supervision, and in May 1949 it was admitted to the UN. Yet this was in no way the end of the early story. The birth of Israel and the simultaneous Palestinian refugee problem had a radicalizing effect on Israel's neighbors. With Palestinians lingering in refugee camps in Jordan, Lebanon, Syria, and Egypt, many Arabs came to view Israel as a pariah state and a continuation of European colonization in a period of supposed decolonization. In the three years following the cessation of the 1948 war, there were major political upheavals in Israel's neighboring states. Jordan's King Abdullah was assassinated in East Jerusalem by a Palestinian, Egypt's king was overthrown by the Free Officers Movement led by Gamal Abdel Nasser, and Syria endured a period of coups. Furthermore, Jewish communities in the greater Middle East came under severe pressure from Arab nationalists who began, in most cases without evidence, to equate Middle Eastern Jews with Zionism. As a result, during 1949–1953 almost 300,000 Middle Eastern Jews fled from their nations of origin to Israel, the largest group coming from Iraq. While many were not Zionists and hoped to move to other countries besides Israel, U.S. immigra-

tion quotas forced many of these people to settle in the new Jewish state. As the Cold War threatened to become hot and the Middle East slowly developed into a Cold War theater, the Arab-Israeli conflict began to play a seminal role in global politics.

The Caribbean and Postcolonialism

The Caribbean consists of the current and former colonies of Britain, France, Spain, Denmark, and the Netherlands as well as territories that currently belong to the United States and several Latin American nations. The Caribbean continues to be a zone of considerable cultural and social complexity, facing a myriad of individual and collective challenges and opportunities. The last six decades have witnessed the decolonization of 12 formerly British territories, a revolution in Cuba with far-reaching regional repercussions, the demise of dictatorships in Hispaniola, and the U.S. invasion of Grenada in 1983. While often divided in terms of politico-economic objectives, a greater sense of Caribbean commonality is developing in both intergovernmental relations and in popular culture within both the Caribbean and its considerable migrant diaspora.

Since the former colonial powers had structured Caribbean economies to be export oriented and focused on cash crops, the goal of the new nations of the region has been increased self-reliance, regional integration, and economic diversification. While tourism and agriculture (especially sugar and bananas) continue to be the

➤ CARIBBEAN CULTURAL NATIONALISM

Cultural nationalism remains a vital force across the Caribbean, especially as the region's relatively new states seek to forge distinctive national identities. While cultural imports of all kinds remain prominent in most of the Caribbean, some local cultural creations have had a powerful impact across the region and farther afield. Rastafarian countercultures, emerging first in Jamaica and expressing various ideals of Black Nationalism and popular Pan-Africanism, have become a regional phenomenon. Regional music culture also includes Calypso and its modernized variant, Soca, as well as Trinidad's steelbands and Carnival. While the Caribbean population is predominantly of African descent, friction has emerged in some territories where relations between the state and ethnic minorities are concerned, especially in the cases of Trinidad and Tobago, Guyana, and Suriname. Adding to the modern complexity of the Caribbean is the growing diaspora of Caribbean migrants in the United States, Canada, Britain, France, and the Netherlands as well as growing numbers of return migrants and the increased political influence of diaspora groups that maintain ties with Caribbean homelands.

—Maximilian C. Forte

foundations of many economies in the region, the ending of preferential trading schemes with Europe in the 1990s and increased competition from Latin America have renewed the drive toward diversification. Previous attempts to foment local development included industrialization by invitation in the 1960s whereby transnational corporations were invited to set up assembly plants in the region, thereby increasing local employment; the nationalization of foreign holdings in the 1970s, especially in Jamaica, Trinidad and Tobago, and Guyana (and much earlier in Cuba); and the creation of the Caribbean Free Trade Area (CARIFTA) in 1968 followed by the Caribbean Community and Common Market (CARICOM) in 1972, primarily for the Anglophone Caribbean. By the 1990s economic nationalism was reversed, with direct foreign investment being actively courted, especially under the mandate of structural adjustment regimes imposed by the World

Bank and the International Monetary Fund. Import restrictions to protect infant industries were canceled, currency trading was liberalized, and states divested their economic enterprises. The social impact has been severe in most territories, with unemployment rates still averaging well above 10 percent. The result has been twofold: on the one hand, local conglomerates have developed into transnational corporations in their own right; on the other hand, those with fewer resources have created an impressive informal economy of regional and transnational reach.

One of the major developments in the region in this time period has been the achievement of political independence via negotiations by almost all of the British territories in the region. France continues to maintain colonies in the region (officially termed "Overseas Departments"), namely Martinique, Guadeloupe, and French Guiana. Some Dutch colonies such as Aruba have voted to retain their dependent status, while Suriname opted for independence in 1975. Given the dependent relationship that characterized colonial and postindependence reality for most of the Caribbean, the quest for independent foreign policies and south-south cooperation (ties of mutual assistance between nations of the so-called Third World) have repeatedly arisen as major goals. Most CARICOM members share good relations with Cuba, despite U.S. pressure, and have worked to develop extensive ties with China while also voting in favor of Japan during meetings of the International Whaling Commission. Caribbean countries have cooperated with nations from Africa and the Pacific in international trade negotiations. Perhaps the best evidence of south-south cooperation occurred when Cuba went as far as sending troops to Angola in 1975 to counter invading South African forces.

The Caribbean has seen a series of dictatorships come to power over the last six decades as well as popular revolutions. In the Commonwealth Caribbean, Sir Eric Gairy ruled Grenada through vote tampering and his dreaded Mon-goose Gang from 1974 to 1979 until he was toppled in a bloodless revolt led by the New Jewel Movement under Maurice Bishop, himself overthrown by hardliners in his cabinet in 1983 just prior to the U.S. invasion. Under Bishop, close ties were forged with Cuba, which had undergone

its own revolution in 1959. In Guyana, Forbes Burnham ruled from 1964 to 1985, remaining in power through elections that were widely regarded as fraudulent while centralizing authority in his hands. His party later succumbed to international and domestic pressure for fair elections, which witnessed the rise of his longtime rival party, the Marxist People's Progressive Party. Other territories in the Commonwealth Caribbean lived through the long tenure of populist leaders, such as Vere Bird in Antigua and Eric Williams in Trinidad. François "Papa Doc" Duvalier ruled Haiti from 1957 to 1971 through a combination of brute force using his Tontons Macoutes and religious messianism and was succeeded by his son, who ruled until a popular uprising ousted him in 1986. Haiti has lived with the legacy of military and oligarchic rule and sweeping popular revolts to the present. Trinidad has also seen uprisings, first in 1970 with the Black Power Revolution and then in 1990 with the armed assault on parliament by the Jamaat al Muslimeen, which captured the prime minister and much of his cabinet for six days.

The European Union as a Supranational State

The modern-day European Union (EU) evolved from postwar attempts to create a common market in Western Europe into a system of institutions and political structures that have resulted

in the greater political, economic, and social integration of most of Europe. The potential of developing the EU into a supranational federalized state has been hindered by various internal dissidents who desire to maintain their national sovereignty in the face of the growing power of the EU. Segments of European society debate the pros and cons of further integration and the erosion of the powers of the nation-states that make up the EU. European neofunctionalists (advocates for the nation-state) argue that maintaining national prerogatives among the component nations of the EU is key in its ability to function successfully. In contrast, federalists argue that the maintenance of national prerogatives is a hindrance to the successful development of the EU into an efficient set of institutions capable of addressing common problems.

Signing of the Maastricht Treaty, creating the European Union with twelve founding member countries, Maastricht, Netherlands, February 7, 1992. (European Commission)

► THE MYTH OF A UNIFIED EUROPE

The myth of a United Europe has a long history, fraught in the conflicts of the major European states and in the attempts by certain individuals to conquer and rule for the good of a common European homeland. The Roman Empire of antiquity became a model for the potential to unify the peoples of Europe under a common government, used by later kings and emperors to legitimize their power (such as the Holy Roman emperor of the Germanic nation who ruled vast tracts of Central Europe). The geographic concept of Christendom and the Roman Catholic Church presented medieval Europeans with a common set of ecclesiastical institutions under which to find common ground and identity. While many Europeans regarded themselves as part of these greater geographical conceptualizations, they identified more closely with their region, city, or principality of residence.

The French Revolution (1789–1799) unleashed the concept of nationalism upon Europe, giving entire populations the nation-state as the desirable expression of their interests. Napoleon Bonaparte attempted to unify Europe under his rule while triggering the resentment of nationalists everywhere. In subsequent decades, many Europeans looked inward into their newly formed nation-states, while socialists and pacifists still looked to the day of a common European state unified under more egalitarian and pacific principles. However, Adolf Hitler's National Socialist vision of a unified Europe envisaged German racial supremacy over a hierarchical racial order, leading to a war on a previously unknown destructive scale. The European Union evolved as a response to avoiding such conflict and has been far more successful at realizing the potential for European unification.

—*Abraham O. Mendoza*

The widespread destruction that characterized post-World War II Europe hindered immediate economic and political stability within the continent. The legacy of the quarrelsome 1930s, when European states put up tariff barriers and insulated their economies while neglecting the international interdependence of Europe, thus leading to further ruin, was closely examined by scholars and statesmen. The infusion of capital

in the form of the U.S. Marshall Plan helped reconstruct the fragile West European nations, with the intention of preventing the influence of communism from the Soviet Union. Many European leaders saw the need to address problems in common rather than return to insulated national economies. French statesmen Jean Monnet and Robert Schumann drew up the European Coal and Steel Committee (ECSC) Treaty (1952) to open up the borders and eliminate duties on these vital products for industry in Belgium, the Netherlands, Luxembourg, France, Italy, and West Germany. The European Community (EC), established in 1957, included a parliamentary assembly (Parliament), a council of the corresponding national heads of state (European Council), and a court (Court of Justice) drawing from representatives from the component democracies.

The creation of the EC led to the rapid economic expansion and growth known as the European Miracle in light of its amazing success following the destruction of World War II. This economic success led other European nations to seek inclusion, yet the founding nations disagreed on who to allow, given internal disagreements over further federal integration or maintenance of certain national prerogatives. France under President Charles de Gaulle sought to maintain French supremacy within the EC, bolstering its pretense of being a world power. De Gaulle's stance delayed the entry of the United Kingdom into the EC until 1973. The British also harbored suspicions akin to those of de Gaulle that while economic integration was desirable, political integration was an affront to national sovereignty. European federalists argued that prioritizing national interests on the part of member states set limits on the potential of further federal integration, only made possible by delegating more powers to the EC and its institutions. Along with Britain, Denmark and Ireland joined the EC in 1973. Greece joined in 1981 and Spain and Portugal in 1986 after they had transitioned from authoritarian to liberal democratic governments, which was a prerequisite for joining. Austria, Finland, and Sweden joined in 1995. Following the end of the Cold War, they were joined by Cyprus, the Czech Republic, Estonia, Hungary, Latvia, Lithuania, Malta, Poland, Slovakia, and Slovenia. Further treaties that delegated

specific powers from the states to the EC were the Treaties of Rome (1958), the Single European Act (1987), the Maastricht Treaty (1993), the Amsterdam Treaty (1999), and the Nice Treaty (2000).

Such efforts at furthering integration have their critics and supporters from both the federalists and advocates of national sovereignty. The Maastricht Treaty (Treaty on European Union, or TEU) created a uniform economic and monetary union, gave the European Parliament greater powers, and introduced a common European citizenship, institutions for a common foreign policy, and coordinated institutions for justice and home affairs. Advocates for individual nation-states were concerned that the treaty meant the loss of certain national prerogatives. Certain nations, such as Denmark and Britain (known for its fervent Euro-skeptics), chose to opt out of certain EU statutes concerning currency (the Euro) and freedom of movement of goods, trade, and people (Schengen Agreements). Other nations, such as Italy and Germany, have sought to further federalist integration to ensure effective governance and coordination as the EU

expands into Eastern Europe. Groups such as the Basques, Scots, and Welsh seek greater devolution from their current nation-state governments and greater integration for their interests within the EU. However, the 2005 referendums on a common European constitution in France and the Netherlands, which constituted a majority no vote in both countries, illustrate the current growing skepticism at the devolving role of the component nations to the aggrandizing federalist EU. The possibility of Europe developing into a supranational state with the potential to compete on par with the United States and China in a multipolar world has others clamoring for the further political and economic integration of the EU.

■ Introduction: Human Rights Mobilization

The concept of innate human rights originated in the philosophy of Enlightenment thinkers and was incorporated in the foundational documents of various republics established over the course of the eighteenth and nineteenth centuries. Yet the period following the end of World War II has been marked by greater international recognition of a basic set of human rights, reflected in the formation of international organizations such as the United Nations (UN) and agreements with the purpose of holding nation-states accountable for human rights violations. A foundational document is the UN “Universal Declaration of Human Rights” (1948). Moreover, the decades following World War II were marked by the emergence of a range of social movements by (or on behalf of) aggrieved or subjugated populations pressing their respective governments to provide civil liberties and/or

civil rights to all of its citizenry. Oppressed racial groups in the United States and South Africa mobilized to dismantle de jure (legally sanctioned) racial inequality in all aspects of the public sphere, while citizens in the Soviet-occupied countries of Eastern Europe asserted national autonomy and dissatisfaction with the restriction of civil liberties through individual and organized acts of civil disobedience.

These and other social movements (including student movements around the world in the tumultuous year of 1968 and thereafter) were mostly met with brutal state repression. Yet racial social movements in the United States and South Africa were ultimately successful in dismantling de jure racial discrimination and in pressing the state to implement reforms designed to realize greater structural equality for people of color. These movements, particularly the U.S.

civil rights movement, have influenced the formation of other racially conscious movements in places such as Brazil and Australia and informed the rhetoric of feminism, gay rights advocacy, and other social movements. In the case of Eastern Europe, Soviet-occupied nations were able to realize the goals of self-determination with the fall of the Soviet Union.

Though humans across the globe have been able to secure greater civil liberties and rights through social movements, challenges remain with regard to the full realization of universal human rights as set forth by the UN at the dawn of this era. Nation-states continue to debate over the definition of human rights as set forth by international agreements, citing the primacy of domestic agendas such as national defense and cultural or religious traditions. People within both developed and developing nations continue to lack basic human needs, such as food, shelter, and access to clean water, health care, emergency services, and medicine, despite the humanitarian efforts of domestic and international nongovernmental organizations (NGOs) such as the International Red Cross, Direct Relief International, Doctors without Borders, and Oxfam as well as foreign aid. Continuing structural inequality, hate crimes, famine, and genocide in various parts of the globe illustrate that some groups still remain vulnerable in the twenty-first century despite significant state reforms and international recognition of basic human rights.

Human Rights Treaties and Covenants since 1945

At the end of World War II, reflecting on the scale of deaths and atrocities that warfare had inflicted on military and civilian populations, the victorious Allied powers drafted a set of universal principles of human rights, based primarily on Western intellectual traditions, to prevent such excesses from occurring in the future. Under the aegis of the newly formed United Nations (UN), the international body created by the Grand Alliance (Britain, the United States, France, the Soviet Union, and China), various human rights treaties and conventions were signed, ratified,

and implemented as part of international law by most of the world's nation-states over the course of the latter half of the twentieth century. The growing body of human rights conventions during this period allowed the major players in the Cold War to call each other into account when gross violations of human rights occurred. Decrying human rights abuses also became an ideological weapon of the Cold War.

Before World War II, the European great powers had already created various international measures to prevent human rights abuses during times of war (i.e., the Geneva Conventions, the Permanent Court of Arbitration, and the League of Nations). These measures relied on European conceptualizations of inherent human rights, based on the Enlightenment ideals that earlier had led to such documents as the French Declaration of the Rights of Man and Citizen (1789) and the U.S. Bill of Rights (1789). Following the carnage and horrors of World War II, the nascent UN adopted the Universal Declaration of Human Rights (UDHR) in 1948 to specify social, economic, and political rights of all people. The UDHR explicitly specified within its 30 articles universal principles applied to all of humanity, focused on essential human freedoms such as the right to life, liberty, and security. Furthermore, it also acknowledged universal human dignity and the requisite prevention of torture, unlawful detention, arrest, and freedom of movement, asylum, property, assembly, and livelihood, thereby proscribing signatories to abide by these principles. The UDHR was adopted almost unanimously by members of the UN, with the abstention of the Eastern Bloc under Soviet domination, South Africa, and Saudi Arabia. However, signatories almost immediately became embroiled in disputes over interpretation of the document's broad language. The Convention on the Prevention and Punishment of the Crime of Genocide was also adopted in 1948, with the intent of forever preventing the horrors of the Holocaust (1939–1945), which resulted in the deaths of 6 million European Jews under the German Third Reich.

Growing Cold War tensions between the superpowers (the United States, the Soviet Union, and China) throughout the 1950s to the 1980s often resulted in governments relying on the trea-

ties as ideological weapons. The United States and its anti-Soviet allies were quick to condemn Soviet actions that broached human rights (for example, following Soviet military intervention during the Hungarian Revolution, 1956; Prague Spring, 1968; the invasion of Afghanistan, 1979). In the 1960s, the Soviets were keen to criticize U.S. Jim Crow laws regarding African Americans as violations of human rights covenants. The Soviet Union and China were also able to suggest U.S. hypocrisy on human rights, specifically regarding brutal U.S.-sponsored actions against communist-nationalist insurgencies (Vietnam, Chile, and Guatemala) in the developing world and brutal actions taken by the anticommunist authoritarian U.S. allies (Argentina, Iran, and South Africa).

The issue of national sovereignty also touched off major debates over human rights agreements. States such as the United States, China, and Israel believed that interpretations of the vague human rights conventions could be manipulated so that actions unique to their own situation would be deemed as violations of human rights. Many U.S. politicians believed that human rights covenants would not only violate its national sovereignty but would also impede their ability to engage the communists successfully in the Cold War. The State of Israel, under increasing diplomatic isolation and surrounded by hostile Arab states, believed that human rights covenants would prevent it from defending itself in its unique situation vis-à-vis the Palestinian refugees in Gaza and the West Bank. States under theocratic Islamic rule such as Iran (post-1979), Saudi Arabia, and Afghanistan viewed human rights covenants as Western universalist precepts that overlooked cultural and religious traditions that held sway for centuries (such as Sharia). Many postcolonial African, Latin American, and Asian states (Kenya, Uganda, South Africa, and Singapore) also refused to abide by certain human rights covenants when stipulations and articles conflicted with their domestic policies, typically claiming that such conventions were based on European intellectual traditions and not in fact concerned with addressing unique cultural traditions of the non-Western world. Contemporary genocides, such as those in the former

The Growth of International Aid Groups

International aid may be economic, humanitarian, or military. Since the end of World War II in 1945, it has become a defining feature of the relationship between the affluent global North, the main donors, and the developing global South,

OXFAM

Oxfam, originally the Oxford Committee for Famine Relief, is a British group founded in 1942. Its original purpose was to help feed people suffering from the German occupation of Greece. The organization grew rapidly in the postwar years as it sought to feed famine victims in Europe after the devastation caused by World War II. While the parent company remains British, today Oxfam is affiliated with 11 other national Oxfams. The charity has more than 3,000 partner organizations in more than 100 countries. Besides directly fighting famine, Oxfam also advocates for fair-trade principles in order to help combat poverty, urging, for example, the reduction of government subsidies to U.S. cotton farmers. Oxfam sponsors events such as “Fast for a World Harvest” and “Hunger Banquet” in schools and communities in order to raise both awareness and funds. Currently, Oxfam is one of the largest and best-known organizations devoted to fighting poverty and hunger.

—Joshua Hoffman

the recipients. Propelled by decolonization, the Cold War, and the United Nations (UN), the giving or receiving of international aid was from the beginning intertwined with transnational politics, as different donor states or agencies sought to use aid as a lever for increasing their influence or attempting to prop up different states as allies in the Cold War.

During 1945–1950 an enormous amount of aid was supplied to war-torn Europe, Japan, and other Asian areas. In addition, with the postwar spread of decolonialization, aid was supplied to newly independent major countries that urgently required development assistance, including India and Pakistan (1947) and Indonesia (1949). In response to this pressing need, the Colombo Plan (so-named for the capital of Ceylon, now Sri Lanka) was launched in 1951. It was the beginning of modern aid. At first intended for the benefit of Ceylon, India, and Pakistan, the Colombo Plan was subsequently expanded to include almost 20 other Asian countries ranging from Afghanistan to the Philippines. The individual aid programs of the plan are negotiated individually between the recipient and donor

countries (the United States, Japan, Britain, Australia, Canada, and New Zealand).

The UN, founded in 1945 with the primary function of keeping the peace, has been a forum for the newly independent states to request developmental aid from the international community. It has numerous agencies devoted to different forms of developmental aid, providing vital services to less-affluent states in need of financial or technical assistance. The first UN specialized agency, the Food and Agricultural Organization (FAO), was founded in 1945 to combat hunger. The World Health Organization (WHO) was established in 1948 to address health education, sanitation, family planning, disease prevention, immunization against infectious diseases, and other health-related issues. Other UN agencies address issues related to refugees and other human needs.

By the 1960s, international aid became institutionalized as a major force in transnational politics. Most major developed countries had established departments tasked with running their aid programs, while the UN declared the 1960s its First Developmental Decade, and new organizations were created, including the International Development Association (IDA), part of the World Bank, formed in 1960 to provide loans to the least-developed countries. The Development Assistance Committee (DAC), also formed in 1960, is a part of the Organization for Economic Cooperation and Development (OECD). Comprised of 17 donor countries, DAC represents the world's largest source of developmental assistance. In 1961 the United States established the U.S. Agency for International Development (USAID) to promote American interests by assisting other states in economic development. The UN expanded in 1965 to meet growing demands for aid from developing countries with the establishment of the United Nations Development Programme (UNDP).

By the 1970s private, volunteer-based non-governmental organizations (NGOs) were becoming increasingly involved in development as a substantial force in their own right. Representing a diverse array of interests and views on aid, NGOs may receive public funding, but the bulk of their funding is private. The different kinds of NGOs partake in a number of types of

developmental assistance: Oxfam, one of the best-known aid NGOs, is involved with long-term projects aimed at alleviating poverty in the developing world. Another well-known NGO, Cooperative for American Relief Everywhere (CARE), aims at improving social and economic conditions by promoting development and the use of local resources. There are hundreds of other NGOs involved in international aid.

Starting in the early 1980s, the relationship between aid donors and recipients underwent fundamental changes. By the middle of the decade recipient countries found that they had to meet a number of donor demands having to do with greater privatization of their economies, democratic reforms, human rights programs, and so on. By the 1990s with the end of the Cold War, the aid recipient countries found themselves unable to appeal to the Soviet Union as an alternative source of funding, giving Western donors further leverage in dictating how the aid is used and the conditions attached to it.

International aid has come under criticism from a number of diverse fronts. Old colonial powers sought to use aid to maintain influence over their former possessions. Most glaringly, international aid had been a major weapon during the Cold War, as the two superpowers dispensed aid to recruit allies from nonaligned countries, bolster governments perceived to be sympathetic to them, or even contribute to war efforts. Furthermore, Cold War priorities meant that oftentimes aid was disbursed to corrupt or inept governments with the overall intention of propping up allies even at the expense of economic development. After the end of the Cold War, Western donors found that they were no longer obligated to match or surpass communist aid, with the result that they often cut back aid or reconstituted the terms of the aid agreement to give themselves more leverage in its disbursement and usage, often in such a way as to benefit themselves even over the aid recipient.

Problems of a different sort confront aid programs run by the UN or NGOs. The UN programs, which have the advantage of being less directly beholden to the politics of individual donor states, are oftentimes accused of mismanagement of funds, a failure to effectively coordinate their efforts, and general inefficiency.

NGOs were at times falsely accused of being agents of imperialism.

International aid in part has led to an increase in the real per capita gross national product (GNP) of developing countries, bringing significant medical advances and providing much-needed disaster relief. Although international aid has come under heavy criticism, often for being too little or for being paternalistic, it will continue to play a significant role in transnational relations.

The U.S. Civil Rights Movement

The U.S. civil rights movement, which activists and scholars now more frequently refer to as the modern Black Freedom Movement, was a social movement that involved mass protests and local and national organizing to challenge racial discrimination in the United States, particularly in the South. The movement, which operated both on a grassroots and national level, along with earlier U.S. Supreme Court decisions prompted the Civil Rights Act of 1964 and the Voting Rights Act of 1965 that marked the end of the Jim Crow era in the South. The movement represented an enormous historical shift as the racial caste system in the United States and its ideological underpinnings were challenged and dismantled, and civil rights, including voting rights, and rights to equal public facilities were extended to all U.S. citizens. The civil rights movement was also well timed to capitalize on Cold War political pressure for the United States to live up to its ideals and rhetoric, yet the movement's successes came at the price of common people risking reprisals and death to demand an end to the terror-enforced oppression inherent in the racial status quo.

The modern Black Freedom Movement can be traced, in part, to protests during World

Civil rights advocates (front left–right) Roy Wilkins, Asa Phillip Randolph and Walther P. Reuther clasp hands as they lead hundreds of thousands of people in a multiracial march on Washington, D.C. in August, 1963. (Lyndon Baines Johnson Library)

War II. African American soldiers and their communities protested against segregation and the separate and unequal Jim Crow realities of serving in the military. At the same time, A. Phillip Randolph, president of the Brotherhood of Sleeping Car Porters, after threatening President Franklin Delano Roosevelt with an organized mass protest march on Washington, D.C., prompted Executive Order 8802 in 1941 that required war industries contractors to end discrimination in hiring practices. War industries employment increased living standards for the nation's minorities.

During the Cold War, when McCarthyism and loyalty campaigns made mass protests appear un-American, the National Association for the Advancement of Colored People (NAACP), founded in 1909, won a major legal victory in 1954 with the *Brown v. Board of Education* U.S. Supreme Court decision, which declared “separate but equal” school systems inherently unfair and unconstitutional. The Court, however, refused to set a timetable for change. Nevertheless, this landmark legal decision helped spur the mass protests and activism of the ensuing civil rights campaigns. Those campaigns depended on a coalition that included conservative, often church-based African American leaders; the often more radical African American student protesters; a mobilized working class; and Northern

white liberals, including Christian clergy, students, and Jewish rabbis and elites, among them Holocaust survivors. The nonviolent mass protests often succeeded best when they provoked street violence, revealing the ugliness of racism to the media and the world to force federal protection and legislation. One of many such examples occurred in 1963 when Eugene “Bull” Connor, the police chief of Birmingham, Alabama, turned fire hoses and attack dogs on children marching to protest segregated public facilities. Leaders were aware that Cold War rhetoric of American freedom and moral superiority were contradicted by ugly street confrontations that coaxed into the open the hidden violence of the racial status quo.

The first mass protest began the year after the *Brown v. Board of Education* decision. Rosa Parks, a secretary of her NAACP chapter in Alabama, challenged Jim Crow laws when she refused to give up her seat on a crowded bus to a white passenger on December 1, 1955, and was arrested. The local black community began a boycott of the bus system, founded the Montgomery Improvement Association, and asked the Harvard-educated local minister Martin Luther King Jr. to lead the newly formed association. Among the boycott's modest demands were that black bus drivers be hired, drivers cease to speak rudely to black passengers, and seating remain segregated but on a first-come basis. A one-year campaign ensued with many threats of violence to King, including the bombing of his house. One year later the city agreed to the boycott demands. King and other religious leaders formed the Southern Christian Leadership Conference (SCLC) to continue the nonviolent effort to end discrimination in the United States.

Mobilized students and workers instigated several other important campaigns in the civil rights movement that again drew media coverage to violence committed against nonviolent activists including sit-ins, Freedom Rides, and voter registration drives. On February 1, 1960, four African American college students sat at a whites-only Woolworth's diner counter in Greensboro, North Carolina. Refused service, they returned day after day. Their five-month protest eventually led Woolworth's to change its whites-only policy. At the grassroots level, this protest

encouraged many more sit-ins at lunch counters, sleep-ins at whites-only motels, swim-ins at whites-only swimming pools, and even watch-ins at movie theaters. The nonviolent protesters often prompted hecklers and mob violence. In tandem with the sit-ins, in February 1960 the SCLC encouraged student leaders to form their own organization, the Student Non-Violent Coordinating Committee (SNCC).

The following year, 1961, the Congress of Racial Equality (CORE), a northern-based group, arranged Freedom Rides to challenge the constitutionality of segregated seating arrangements on interstate buses in the South. Trained in non-violence, the integrated Freedom Riders hoped to challenge the status quo. The first bus made it to Alabama, where a local order of the Ku Klux Klan set the bus on fire and beat up the fleeing passengers. When the Freedom Riders found another bus in Birmingham, Alabama, an armed mob with chains, baseball bats, and pipes set upon the Freedom Riders. With news reporters covering these incidents, the Kennedy administration, slow to act on civil rights, began to demand FBI investigations and to put into motion the legislative changes that Lyndon Johnson would later enact. Ongoing protests in Birmingham, led by Martin Luther King and the SCLC, spurred federal action particularly when in May 1963 the flagging movement's leaders decided to allow schoolchildren to join the street actions, and the local police chief permitted police armed with clubs, attack dogs, and high-pressure hoses to attack them.

A. Phillip Randolph was the prime organizer of the August 28, 1963, March on Washington; the protest march drew 250,000 marchers, both African Americans and other Americans. The protest's centerpiece was to urge Congress to enact the civil rights bill that passed the following year after the assassination of Kennedy. However, the sweeping legislation did not focus on the right to vote in the South. The SNCC had been working since 1961 on a campaign to enlist black voters in Mississippi, where fewer than 7 percent of African American adults had managed to register to vote. SNCC workers and locals brave enough to attempt to register to vote were running risks. Many were threatened, had crosses burnt in front of their headquarters, or were shot at or

➤ U.S. CIVIL RIGHTS AND THE COLD WAR

Following World War II as relations between the United States and the Soviet Union soured, both sides attacked each other's purported abuses of human rights. For the United States, race relations were a sore spot, especially after postwar lynchings in the South of black army veterans in addition to the continued practice of segregation and disenfranchisement of African Americans. In the context of the early Cold War, labeling domestic advocates of civil rights as communists was a common practice, but ingrained racism continued to tarnish the image of the United States abroad, and legal efforts to curtail segregation and protests accelerated. President Harry S. Truman, through Executive Order 9981 in 1948, called for the desegregation of the armed forces as a response to international criticism, stirred by Soviet propaganda that mocked segregated U.S. occupation forces in Europe and Japan. Through the 1950s and 1960s both President Dwight D. Eisenhower and President John F. Kennedy, embarrassed by racial conditions in the American South and acts of violence that met protests, began taking steps toward ensuring civil rights to prevent the Soviets from critiquing American democracy. Nonetheless, lynchings, beatings, and overt acts of discrimination continued to tarnish the U.S. image abroad. It was not until President Lyndon B. Johnson actively initiated civil rights legislation in the late 1960s, in response to the grassroots civil rights movement across the country, that significant inroads were made into dismantling segregation and de jure institutionalized racism. Throughout this period, Soviet criticism affected the choices that policy makers made in regard to extending civil rights to all Americans.

—Abraham O. Mendoza

murdered. The FBI, although now in the area, insisted that it was only gathering information. Following the March on Washington, organizers from the SNCC, CORE, and the NAACP decided to make Mississippi their primary focus for the summer of 1964. Calling the new campaign Freedom Summer, SNCC leaders agreed to invite white students down to aid the voting drive. In June two of the white students and an African American student were murdered in Mississippi.

Following the activities of Freedom Summer and a voting drive early the following year in Selma, Mississippi, President Johnson went on television urging Congress to pass the legislation that culminated in the Voting Rights Act of 1965.

These two legislative triumphs became the high point of the civil rights movement. The united interracial movement, marked with cooperation, courage, mass protests, and rhetoric of Christian morality, began to unravel. While voting registration campaigns wrought huge changes in the South, African Americans in the North, chafing under ongoing discrimination in housing, jobs, and police brutality, gave way to frustration. The civil rights movement had done little or nothing for them. A riot erupted in Harlem in 1964, and a far larger riot—or uprising—occurred in Watts in the summer of 1965 and left 35 people dead. Johnson, ever seeking legislative solutions, launched his War on Poverty and its myriad programs to train and empower African Americans and poor white Americans, even as he mired the U.S. military more deeply in the costly war in Vietnam.

Simultaneously, the African American student leaders of the SNCC were disturbed that it took the deaths of white students to spur legislative changes. A power struggle ensued between the more moderate voice of King and student leaders such as Stokely Carmichael of the SNCC who during the Selma voting campaigns began to advocate Black Power. The revolution in consciousness that activists had dreamt of had not emerged. Popular interest drifted toward the angry rhetoric of black nationalist Malcolm X and the militant, revolutionary stances of new groups such as the Black Panther Party in Oakland, California, which drew common cause between minorities in the United States and colonized nations and peasant groups abroad. Renewed Pan-Africanism was a large component of this sensibility. While Black organizers continued to seek to empower local communities, often under the auspices of the War on Poverty, cultural movements such as Black is Beautiful and the Black Arts Movement emerged.

Under the leadership of Carmichael, the SNCC forced white students out of its organization to take up their own causes. These white student veterans of Freedom Summer became

leaders of the increasingly radical student movement and antiwar protests that erupted in the 1960s. In addition to a changed U.S. South and a cultural revolution, the legacy of the civil rights movement included other protest movements of the 1960s and 1970s such as Chicano power, the American Indian Movement, the women's liberation movement, gay liberation, environmentalism, and the global antiapartheid movements of the 1960s through the 1980s.

Student Protest Movements, 1945–1960

The freedom of thought encouraged at universities that has always made them potential vanguard institutions for social change incubated a near-revolution in the 1960s. The U.S. civil rights movement, labor movements worldwide, and the Vietnam War fostered the revolutionary fervor that developed in universities and then spilled out into the streets. Following the occasionally violent attempts at government suppression of these student movements, student politics later shifted to other causes such as environmentalism, antiapartheid, women's rights, gay rights, and more recent concerns about globalization and its impact on environment and labor.

In 1954, the landmark U.S. Supreme Court decision *Brown v. Board of Education* declared segregated school systems unconstitutional. Non-violent protests and civil disobedience followed. In 1955, African American community activists organized the bus boycott in Montgomery, Alabama. This incident spurred the founding of the Southern Christian Leadership Conference (SCLC), a mainstay of the civil rights movement. Student involvement in civil disobedience also soon followed. In February 1960, four African American college students performed a sit-in at a segregated Woolworth's drugstore counter in Greensboro, North Carolina, and were met with outrage and national media interest. In 1960, African American students forged the Student Non-Violent Coordinating Committee (SNCC). The SNCC organized integrated groups of Freedom Riders who sought to desegregate interstate busing. The organization also showed similar courage in leading campaigns to register African Americans to vote in Mississippi and other Southern states.

In 1964, the SNCC's leadership decided to train 800 white students to participate in Freedom Summer and register black voters in Mississippi. Three volunteers were killed that summer, one of them African American. All of the volunteers experienced the violent atmosphere that this demand for basic rights engendered. Many of the middle-class white volunteers returned to their elite institutions politically transformed. After volunteering in Mississippi, for example, philosophy student Mario Savio returned to the University of California, Berkeley, and emerged as one of the leaders of the Berkeley Free Speech movement that began in the fall in 1964. The Free Speech movement, protesting a university decision to shut down an area where student political groups handed out leaflets, relied on tactics developed in the civil rights movement. The mass rallies at Berkeley involving speeches, songs, signs, teach-ins, and sit-ins presented to the world a startling image: ranks of neatly dressed students in suits and ties demanding social change. Civil rights training also prepared many other key student activists, including leaders of Students for a Democratic Society (SDS), a group founded in 1962 at the University of Michigan that began with trade union affiliation. By the

Students protest in Tiananmen Square in front of the "Goddess of Democracy" statue, which faces Chairman Mao Zedong's portrait, May 30, 1989. (Peter Turnley/Corbis)

On Tiananmen Square in Beijing, China, in the spring of 1989, the student-led prodemocracy movement captured international interest. For more than two months, student protesters occupied Tiananmen Square making speeches and staging parades, hunger strikes, and sit-ins while issuing demands and pleas for democracy. International television coverage showed Chinese students erecting a 30-foot replica of the Statue of Liberty. Faced with a crisis similar to that of the collapsing Soviet Union, China's leader, Deng Xiaoping, called in the army to restore order. On June 3, 1989, in front of numerous international witnesses, tanks and troops opened fire on and massacred protesters and crushed the movement. Many of the leaders fled or hid, while others were jailed. Some of the student leaders who made their way to Western nations such as France and the United States were hailed as heroes and continued to call for democracy, the release of China's political prisoners, and human rights reforms in China.

—Fred Nadis

mid-1960s, the SDS shed its subdued image (and clothing styles) and became a major force behind campus teach-ins and antiwar protests in the United States.

The year 1968 was one of social upheavals worldwide. In January, student protests in Czechoslovakia aided the appointment of reformist president Alexander Dubcek. Dubcek's short-lived reform program, known as the Prague Spring, was accompanied by a flourishing youth culture complete with drugs, rock-and-roll clubs, and hippie fashions and lifestyles. In August 1968, the Soviet Union sent in troops and tanks to end Dubcek's reforms in a largely bloodless military takeover. One Czech student, Jan Palach, burned himself to death in the main square in Prague to protest the Soviet occupation. Commemorations of his death spurred further protest marches. While anti-Soviet sentiment may have sparked protests in Eastern Europe, worldwide student activists were denouncing the U.S. government's war in Vietnam.

Learning tactics from media coverage of other disturbances, student activists arranged protests worldwide throughout 1968. Although activists aimed their initial protests at university administration policies, these protests also embraced wider countercultural values and critiques of national and international politics. In their manifestos and calls for nonviolent cultural revolution, democratic reform, unity with the oppressed, or violent revolution, students worldwide called into question the system, that is, the entire ordering of modern society. The protests were often as much a celebration of youth as efforts directed at sharply defined goals. In May 1968, Columbia University students, airing campus grievances and wider grievances over Columbia's role as a landlord in the neighborhood, took over campus buildings. At that same time in France, student protests in Paris led to immense social disruptions. Sit-ins at the Sorbonne in early May spread to further civic disruptions as France's union leaders encouraged millions of workers to join student protesters in a 24-hour general strike on May 13. Other strikes and sit-ins at factories and universities shut down much of the country for the next 15 days and led to government concessions to labor demands.

That fall in Mexico City, a student protest ended in a massacre. On October 2, after months of protests and civic unrest, as many as 10,000 people gathered on Tlatelolco Square in Mexico City demanding greater political liberty in Mexico and an end to the one-party system. Held during the summer Olympic Games in Mexico, this rally infuriated officials. As darkness set in, government helicopters dropped flares over the crowd, and armed police and military personnel then slaughtered at least 300 civilians. While army helicopters and tanks patrolled the square, police assassinated student leaders trapped in a hotel above the square.

That same month was a high-water mark for street violence in Japan. While many factions were involved, many leaders belonged to the Zengakuren, a student group founded in 1948 with close ties to the Japanese Communist Party. Just weeks after the Tlatelolco massacre, in late October, approximately 6,000 Zengakuren members helped spark riots in Tokyo that included efforts to storm Japan's parliament in Tokyo as well as bloody street fighting with riot police. Simultaneous student uprisings occurred in many of Japan's university cities, including Osaka, Kyoto, Fukuoka, and Sapporo. Government suppression became more overt worldwide. In the United States, many were shocked when the Ohio National Guard shot and killed four students during a demonstration against the Vietnam War in May 1970 at Kent State University.

While government crackdowns worldwide ended the street-fighting phase of the student rebellions of the late 1960s, a crisis of authority that originated in the 1960s has lingered, and student organizations have been among the progressive groups mobilizing around new causes. In the 1970s, for example, the focus of student protests turned to environmentalism, No Nukes campaigns, and antiapartheid.

The antiapartheid movement was rekindled in the Soweto Riots of 1976 when the South African government shot and killed 69 young students who had formed a peaceful march to protest a new rule requiring that school teachers rely solely on the language of Afrikaans in the classroom. The Soweto Riots became an international scandal. The escalation of violence-

marred protests in South Africa eventually led for calls of divestment, that is, for universities to stop investing in corporations that did business with South Africa. Worldwide protests also persuaded numerous nations, including the United States in 1986, to impose economic sanctions on South Africa. The official end of apartheid in South Africa came in 1992.

While boisterous students have been a historical presence for centuries, the 1960s presented a turning point. Student activists, inspired by the civil rights movement and countercultural values, began to organize across the globe for serious social causes, for political change, and, as the title of U.S. Yippie-leader Abbie Hoffman's book put it, to encourage "Revolution for the Hell of It."

Civil Disobedience Movements in Eastern Europe against Communism

From 1945 to 1990, in the midst of the military occupation of Eastern Europe by Soviet forces, segments of the population of these various countries, using passive forms of dissent, displayed their unhappiness toward the communist regimes imposed on them from Moscow. On various occasions, through the participation of labor organizations, intellectuals, university

students, and Communist Party functionaries, nonviolent movements of civil disobedience against Soviet hegemony advocated change. Mass demonstrations, labor strikes, underground presses, and passive civil disobedience showed the world that not all was well behind the Iron Curtain.

Public disaffection with the imposition of People's Democracies as fronts for Soviet domination in Eastern Europe in the postwar era first emerged in Poland in 1956. The Polish Communist Party under the leadership of Wladyslaw Gomulka dissolved the Soviet grip on the party and the state and instituted greater Polish autonomy. While upsetting Moscow, Gomulka avoided military conflict by maintaining socialist solidarity and guaranteeing Poland's participation in the Warsaw Pact.

Hungary's attempt to lessen Soviet domination was not as successful. Hungarian prime minister Imre Nagy attempted to dissolve links with the Soviet Union by withdrawing from the Warsaw Pact and seeking Western support in 1956. Moscow did not want to appear weak in the eyes of both the Eastern Bloc and the West and sent tanks into Hungary to crush the insurgency. Nagy and other leaders were executed, and mass demonstrations were suppressed.

The revolutionary year 1968 was marked by the Prague Spring in Czechoslovakia, which was a policy on the part of Czech leader Alexander Dubcek for greater Czech self-determination and a relaxation of Soviet power. The massive peaceful demonstrations that marked this new policy, as in Hungary more than a decade earlier, were met by a Soviet military incursion of tanks that occupied Prague and restored order, removing Dubcek and his associates from power. In response to this subversive threat against Moscow's authority, Soviet leader Leonid Brezhnev enacted what is known as the Brezhnev Doctrine, which indicated that the Soviet Union had the right to intervene in its sphere of influence to quell any potential unrest or disaffection that might have a negative effect on its authority.

Growing discontent with economic stagnation and political oppression in the 1970s and 1980s led to underground manifestations of civil disobedience throughout Eastern Europe. The

► EXCERPTS FROM THE MANIFESTO OF CHARTER 77 (JANUARY 1, 1977)

The creation of Charter 77 was a crucial chapter in Czechoslovakia's dissident movement. Its backers were committed to defending human and civic rights within the Soviet sphere in Eastern Europe. This manifesto accused the Czechoslovak government of hypocrisy for signing international treaties on human rights while continuing to violate those of its own citizens.

"The human rights and freedoms underwritten by these covenants constitute features of civilized life for which many progressive movements have striven throughout history and whose codification could greatly assist humane developments in our society.

We accordingly welcome the Czechoslovak Socialist Republic's accession to those agreements.

Their publication, however, serves as a powerful reminder of the extent to which basic human rights in our country exist, regrettably, on paper alone.

The right to freedom of expression, for example, guaranteed by Article 19 of the first-mentioned covenant, is in our case purely illusory. Tens of thousands of our citizens are prevented from working in their own fields for the sole reason that they hold views differing from official ones, and are discriminated against and harassed in all kinds of ways by the authorities and public organizations. Deprived as they are of any means to defend themselves, they become victims of a virtual apartheid."

"Country Studies. Appendix D: Manifesto of Charter 77-Czechoslovakia." http://memory.loc.gov/frd/cs/czechoslovakia/cs_appnd.html.

Lessons of 1956 and 1968 were not lost on dissidents, who chose more passive forms of resistance to Soviet domination. The Czechoslovakian organization Charter 77, led by intellectuals and students, criticized the hypocrisy of the current government that accepted international civil rights conventions while stamping out free speech and assembly at home. Polish industrial strikes in 1981, led by Solidarity under the leadership of Lech Walesa, illustrated the popular discontent of the Polish citizenry with a corrupt and inefficient socialist government. Underground writings known as samizdat were prevalent in Eastern Europe and the Soviet Union in this period, spreading and preaching criticism of the Soviet system and the crony governments of Eastern Europe. Many Soviet and East European youths began listening to Western rock music and incorporating Western styles of dress to display their passive displeasure for the current socialist authoritarian system.

As the Cold War drew to a close, the civil disobedience movements of the 1970s and 1980s slowly grew more vocal as Mikhail Gorbachev eased restrictions through his policies of glasnost and perestroika. Popular demonstrations

against the oppression of socialist regimes in the Baltic States, East Germany, Poland, Hungary, Czechoslovakia, and other Eastern Bloc countries characterized the late 1980s. Through non-violent rallies and demonstrations, these peaceful movements eventually forced the socialist leadership of these countries to accept the devolution of their power and cooperate with the accession of liberal democratic governments. As the Soviet Union floundered, communist regimes worldwide were in crisis. While Romania's leaders followed the Chinese example at Tiananmen of violent military suppression of dissidents (1989), most of the leaders of East European states refused to turn to their militaries to quell dissent. Without the backing of a Soviet military occupation—no longer feasible with the Soviet military's new policy of disengagement—the old order recognized that they could never garner enough popular support to survive such a use of force.

Apartheid

A term derived from Afrikaans meaning “separation,” apartheid refers to systematic political, social, and economic organization along racial lines. The South African government’s official policy from 1948 to 1994, apartheid became a byword for racial discrimination in the modern world. Many opponents depicted it as a system of effective slavery, and the Anti-Slavery Society for the Protection of Human Rights condemned it.

Some analysts view apartheid as a means of securing white political supremacy by methods that were economically irrational and unproductive. Others stress that it was primarily an economic strategy aiding the growth of South Africa’s capitalist economy by ensuring the availability of cheap black labor. Recent scholarship challenges the view that apartheid was a single cohesive policy and emphasizes variation in its application at different times and its more flexible, pragmatic character.

Apartheid became the policy of the predominantly Afrikaner National Party in the 1948 election campaign, but it was based on earlier segregationist measures passed by previous colonial and local English-speaking governments. Since the late nineteenth and early twentieth centuries, black landholding had been restricted to small and overcrowded reserves, while pass laws (which required blacks to carry special documentation) prevented Africans from living and working freely in the towns. The 1910 Act of Union, which created the modern South African state, excluded blacks from voting.

Apartheid went further than earlier segregationist measures. In the first decade of National Party government, the focus of a legislative barrage was the extension of racial separation and discrimination. The Population Registration Act (1950) classified all South Africans by race; the Immorality Act (1950) prohibited sexual contact between whites and other South Africans, in an

attempt to maintain white purity; and the Group Areas Act (1950) enforced separate residential areas in towns. Segregation in education and all public amenities followed. Pass laws were extended to African women. These laws generated sustained opposition by organizations such as the multiracial African National Congress (ANC) and the Pan-Africanist Congress, but the state banned and silenced opponents. In 1960, the police shooting of unarmed demonstrators against the pass laws at Sharpeville highlighted the brutality of the apartheid state, although Western powers continued providing investment and support to South Africa, which they saw as a bastion against communism’s spread in Africa.

In the 1960s apartheid was extended still further with the implementation of separate development. Eight (later ten) Bantustan homelands were created, defined along imposed ethnic lines, and African political rights were confined to them. In 1970, homeland citizenship was imposed on all Africans, thus depriving them of South African nationality and any claim to representation in its government. The main impact of separate development involved the forced removal of over 3.5 million black South Africans from farms and settlements in the rest of the country to the homelands on grounds that they were foreign aliens in white South Africa, where they were entitled to work only as migrants.

During the 1970s and 1980s, separate development began to collapse. The homelands failed to attract investment and were not economically viable, and manufacturing industries needed a permanent labor force rather than migrant workers. The number of urban Africans living in illegal squatter camps around South African cities grew rapidly despite state attempts to force them back to the homelands. Most important, internal resistance in the form of strikes in Durban and Natal in the early 1970s and the Soweto Township uprising in 1976 demonstrated unified black opposition to the state and alarmed foreign investors. Accordingly, some reforms were made such as easing the pass laws, removing segregation in public facilities, and limiting parliamentary representation in 1983 to Indian and mixed-race voters (some of whom were descendants of slaves in the former Cape Colony), but not to Africans. These reforms only rallied further opposition,

and by the mid-1980s, most black townships were in open revolt.

The government responded with a heavy hand, killing many people and detaining others without trial. International condemnation of apartheid grew, but it was not until the Cold War ended in 1989 that the West indicated that it was no longer prepared to tolerate apartheid to bolster its position against the Soviet Bloc. This indication, together with continued mass internal resistance, persuaded Premier F. W. de Klerk to try to dismantle apartheid while still retaining some power for his National Party. In 1990, ANC leader Nelson Mandela was released from jail as key segregationist legislation was repealed, and in 1994, a new constitution finally abolished apartheid and established the Government of National Unity elected by universal franchise. Yet the enormous social and economic inequalities in modern South Africa and the trauma of so many years of repression are legacies that are less easy to remove.

Antiapartheid Movements

The global antiapartheid movement, characterized by its multifaceted and multinational approach at pressuring world governments to cease investment in South Africa, was successful in finally eliminating the second-class status of black South Africans in 1994. For almost half a century after the end of World War II, activists and hu-

Segregated stands in a sports arena in Bloemfontein, South Africa. The rope was separating the races. (Corel)

man rights advocates from around the world struggled together to delegitimize South Africa's oppressive system of apartheid. In spite of Cold War antagonisms, countries such as the United States, the Soviet Union, and Britain and their respective citizenries were able to condemn the policies of the South African government as a result of pressure from the global antiapartheid movement and its influence over university students, international organizations, and civil rights advocates.

Apartheid (meaning apartness in Afrikaans, the language of the South African Boers) was a system of legalized racial segregation put into law by the South African government under the National Party (NP) in 1948. The apartheid system classified South Africa's inhabitants into four distinct racial groups: black (black African), white (Boers, English, and other white South

► BRITAIN'S ANTIAPARTHEID MOVEMENT AND THE SOUTH AFRICAN DIASPORA

As the former colonial power over South Africa, Britain retained cultural and economic links with the devolved Republic of South Africa. South Africa maintained this relationship as a member of the British Commonwealth of Nations beginning in 1931. However, after the institution of apartheid in South Africa in 1948, this long-standing relationship grew strained. The Boycott Movement, a British organization, founded in London in 1959 by South African exiles, was at the center of the international movement opposing South Africa's system of apartheid and in support of South Africa's black population (and the African National Congress). The Boycott Movement's main concern was to establish a boycott of South African goods from British markets on the part of both consumers and wholesalers. Eight months after its founding, the Sharpeville Massacre (1960) aroused widespread indignation against South Africa, leading the Boycott Movement to join forces with Laborites, the Trade Union Organization (TUC), communists, liberals, church organizations, and nongovernmental organizations. The Boycott Movement renamed itself the Anti-Apartheid Movement (AAM) and advocated a more international approach to ending South Africa's racist policies.

Among the AAM's first successes was the withdrawal of South Africa from the British Commonwealth in 1961. It was also able to petition on behalf of political prisoners in South Africa, making the world aware of their plight. In the early 1960s the AAM was active in pressuring economic sanctions by the British government but remained unsuccessful at this goal for decades. The AAM thereby focused on an academic boycott of South Africa in 1965, ensuring that no academic exchanges occurred with that country. Having at first failed to persuade much of the developed world to impose economic sanctions, the AAM focused on mounting an international campaign against apartheid under the authority of the United Nations (UN) in 1966. The AAM's turn to the UN was fruitful, as the UN ensured its activity well until the end of apartheid in 1994. With its humble origins as an exile activist group, the AAM grew to encompass a wide variety of political and social interests. It stands as an example of the political agency of ethnic groups acting in Western countries and the great influence they can have in their host countries' foreign policies, much like Cuban Americans in the United States.

—Abraham O. Mendoza

Africans), colored (mixed race), and Indian, all with specific legal and civil rights along with residential segregation based on race. In particular, black South Africans were designated to live in Bantustans (homelands). Many never did due to their need to work in white South Africa. The apartheid system created a hierarchical system based on racial privilege, with white South Africans enjoying full political rights and opportunities for social advancement while all other designated racial groups were denied such things.

The oppressive policies of apartheid led to increasing internal resistance on the part of non-white race groups, but mostly of black South Africans, primarily in the form of political organizations such as the African National Congress (ANC), the Black Consciousness Movement, and the Pan Africanist Congress. These antiapartheid organizations were linked to other liberation struggles in Africa (i.e., Angola, Congo, and Alge-

ria) and viewed their resistance to apartheid as part of the worldwide socialist struggle (ensuring support from the Soviet Union and China) against Western capitalism. This led to increased police and military actions on the part of the South African government that were characterized by oppression, violence, and multiple and gross violations of human rights. Classing all resistance movement members as potential communists (to gain U.S. support in the midst of the Cold War), the South African government maintained a strong military composed of widespread conscription of all white South African men and ready to assemble and mobilize in the event of a potential rebellion.

International outrage against South Africa's apartheid system was generated by various violent excesses on the part of the government directed toward black South Africans. In the Sharpeville Massacre of March 21, 1960, South

African police began shooting into a crowd of black protesters, killing 69 people and injuring 180 others. This ignited a firestorm of international criticism, mostly in the West and in sub-Saharan Africa. India (which had many links with South Africa given its Indian minority) and the newly independent nations of sub-Saharan Africa, joined by other developing postcolonial nations that had historically struggled against racism, found a common cause in voting against South African actions in the United Nations (UN). By April 1, 1960, the UN National Security Council passed Resolution 134, which condemned the actions of the South African government. In 1973 the UN General Assembly ruled that the system of apartheid was akin to a crime against humanity, defining it as involving “inhuman acts committed for the purpose of establishing and maintaining domination by one racial group of persons over any other racial group of persons and systematically oppressing them.”

In the West, most notably in Britain and the United States, while their governments turned the other way when it came to condemning South African policies, large segments of their populations, galvanized by the political trends of the 1960s (civil rights, liberation movements, the counterculture), pressured governments, universities, and multinational corporations to disinvest and initiate economic sanctions against South Africa. The British antiapartheid movement, which initially sought a boycott in Britain against South African goods, then moved on toward a more international approach against the South African government, gaining momentum in initiatives introduced through the British Commonwealth of Nations and the UN. The U.S. civil rights movement (composed of significant numbers of African Americans who saw a common struggle with black South Africans) paid close attention to events in South Africa and finally attacked President Ronald Reagan’s lack of commitment toward sanctions.

Disinvestment from South Africa was first advocated in the 1960s but was not implemented on a significant scale until the mid-1980s (or divestment). Student activists across the United States protested investment in South Africa by their universities, pointing out how such actions tacitly condoned apartheid. Eventually by 1986

the U.S. Congress passed the Comprehensive Anti-Apartheid Act, which was immediately vetoed by President Reagan but overridden by Congress. This act banned U.S. investments in South Africa, including loans, various commodities, and the sale of arms, and was followed by legislation ensuring an erosion of U.S. support for South Africa.

By 1994 the South African government was fully aware of the international position on apartheid and was suffering economic strangulation as a result of little to no investment from abroad. The government slowly lessened restrictions on nonwhite South Africans in response to external and internal pressures. Negotiations between the government of reformist Frederik Willem de Klerk and ANC leader Nelson Mandela officially ended the last vestiges of apartheid in 1994 and created a new multicultural South African nation with full rights for all citizens regardless of race.

Affirmative Action in Global Comparative Perspective

The term “affirmative action” as it originated in the United States encompasses a variety of public policy programs in areas such as higher education, public- and private-sector employment, and government contract compliance that target women and members of ethnic minority groups. Though such programs have been the subject of considerable debate, the intent of affirmative action policy directives and programs as they were developed in the 1960s and 1970s was to provide greater opportunity for racial minorities and women whose access to employment and higher education was unequal due to a history of discriminatory laws and practices that favored white men.

Issues of racial/ethnic and gender inequality, however, are hardly unique to the United States. Thus, the term “affirmative action” has been applied by scholars to other countries that, at minimum, have passed some legislation or policy directive attempting to achieve the greater representation of disadvantaged groups in at least one of the following areas: employment, education, and political representation. States that have introduced affirmative action policies include Canada, Brazil, South Africa, India, Australia, New Zealand, Britain, Northern Ireland (as a unit of Britain), Tanzania, and Israel, among others. While these programs elude simple comparison (in part because not all countries refer to such policies as affirmative action), a better understanding of the similarities and differences between affirmative action policies in various nations can be achieved by examining three key themes: groups targeted as beneficiaries of affirmative action, the areas that such programs address, and the extent to which governments enforce compliance with affirmative action policies.

Most affirmative action policies internationally have targeted racial or ethnic groups that have been subject to *de jure* (legally sanctioned) discrimination or otherwise have not had recourse to statutory protection when confronted with discrimination in areas such as employment, housing, education, or access to public services. States that have implemented affirmative action provisions based on race/ethnicity include the United States, Canada, Brazil, Britain, Northern Ireland, Australia, and South Africa. Significantly, most governments have avoided implementing or enforcing strict racial/ethnic quotas (specific target numbers or percentages for disadvantaged groups) and have preferred to use somewhat ambiguous language in legislation or administrative directives that instead offer to members of underrepresented groups training programs or other strategies to achieve greater racial/ethnic diversity. A notable exception to this tendency is Brazil, which began implementing quotas for public administrative employment and higher education in 2001.

The group that has been the most consistent target of affirmative action policies across the world has been women; in fact, with the excep-

tion of India, all of the countries referred to herein have implemented policies that have been designed to achieve greater gender equity in the workforce, higher education, or the political sphere. In countries such as South Africa and Israel, affirmative action policies focus on achieving the greater representation of women in managerial or executive sectors of government or state-regulated companies with specify target numbers or percentages, while in Tanzania, programs have focused on increasing female enrollment in higher education.

The cases of Northern Ireland and India are unique in that both countries have implemented policies to address discrimination related to religion. In Northern Ireland, Catholics had been excluded from employment in public services, the police, and several private sectors. Hiring practices had consistently favored members of the Protestant majority, while structural inequality has been blamed on the higher birth rate of Catholics or their geographical location instead of discrimination. Meanwhile, affirmative action programs in India have attempted to address the continuing inequities produced by the Hindu caste system. Affirmative action, referred to as reservation policies in India, involves setting aside nearly a quarter of all government jobs, seats in educational institutions at least partially funded by the government, and seats in electoral bodies for members of the *dalit* caste (the lowest caste, also known as untouchables) and for non-Hindu communities that trace their origins to the original inhabitants of India. Officially, these groups are referred to as Scheduled Castes (SCs) and Scheduled Tribes (STs), respectively.

With regard to the areas in which affirmative action policies have been implemented, most countries have focused on achieving greater diversity in private- and/or public-sector employment. Policies in the United States, Canada, Brazil, and Northern Ireland have targeted private employers that provide services to the federal government to comply with government directives by submitting employment equity plans or implementing specific quotas (in the case of Brazil). These employers can lose a government contract if they have not demonstrated progress toward greater diversification of the workforce at specified intervals. Britain, on the other hand,

while favoring more proactive efforts to further integrate women in the workforce, has historically provided mere recommendations to the private sector for achieving greater workforce equity. However, the British government has recently shifted to providing specific guidelines to private firms for federal contract compliance in correspondence with the Race Relations Amendment Act of 2000.

Interestingly, fewer countries have passed legislation or administrative directives with regard to education. Several Supreme Court cases in the United States have affirmed that the consideration of race as a factor in university admissions is permissible while prohibiting quotas or formulas that assign points to minority students. Meanwhile, both Brazil and India identify specific quotas for African Brazilians or SCs and STs, respectively (Brazil also has quotas for women, the disabled, and students from public schools). Finally, a few countries have attempted to achieve greater diversity within the political sphere by specifying quotas for disadvantaged groups in parliamentary seats (as in the case for women in Tanzania or for SCs and STs in India) or representative bodies for ethnic minority groups that communicate with the central government, as in the case of Australia, New Zealand, and their indigenous peoples.

Though various countries have officially authorized affirmative action programs through the passage of legislation, executive orders, or administrative directives (or a combination of these), the actual success of these policies has depended upon the level of government initiative in enforcement. For example, in India, where reservation policies are incorporated in the constitution and quotas are specified for disadvantaged groups, the actual representation of SCs and STs in the areas of public employment and access to higher education has fallen considerably short of target quotas, in part because India lacks an enforcement mechanism for its reservation policies. Even in countries that have created government agencies to enforce affirmative action policies and investigate discrimination claims, the enforcement powers of such agencies have varied considerably, subject to funding cuts and the preferences of the administration in power. In the United States, the Equal Employ-

ment Opportunity Commission (EEOC) and the Office of Federal Contract Compliance Programs (OFCCP) have consistently experienced problems in funding and staffing and have at times been administered by political appointees who oppose affirmative action policy. The EEOC has routinely confronted a backlog of cases, while the OFCCP has rarely enforced stiff penalties against noncompliant firms. For example, only five companies were banned from doing business with the federal government during the eight years of the Clinton administration. In Australia, organizations relevant to the government policy of multiculturalism were eliminated in 1996 under the Liberal government of John Howard, while employment legislation passed in 1999 opposed any forms of preferences or quotas.

The future of affirmative action in global comparative perspective remains unclear. Though affirmative action appears to be on the decline in the United States, many other nations (such as Northern Ireland, Brazil, Britain, South Africa, and Ireland) have just begun to vigorously pursue and implement affirmative action policies. A core debate remains: while advocates insist that affirmative action addresses past or institutionalized injustices, critics argue such measures create new injustices.

The World Health Organization

Headquartered in Geneva, Switzerland, the World Health Organization (WHO) is an agency of the United Nations (UN), dedicated to the improvement and maintenance of the health of people throughout the world. The WHO constitution was adopted in 1946 and came into force on April 7, 1948, a day now celebrated annually as World Health Day. WHO replaced the Health Organization, which was an agency of the UN's predecessor the League of Nations. As of May 2008, WHO had 193 member states, including all members of the UN except Liechtenstein. Member states are organized into six geographical regions—Africa, the Americas, Southeast Asia, Europe, the Mediterranean, and the Western Pacific—and each of these has a regional WHO office located in a major city.

The WHO constitution endorses a holistic model of health, defined in its Preamble of 1948. Then less common than now, the holistic model defines health as an optimal state of being for an individual and includes the physical, mental, and social spheres of life as all aspects of health. This contrasts with the more common medical model, which defines health as the absence of disease or injury. The preamble also states that health is a fundamental human right that should not be subject to distinctions based on ethnicity, religion, political beliefs, or social or economic condition; again, this is a concept that was revolutionary in 1948 but is endorsed at least in theory today by many governments and organizations.

The preamble is often cited in support of the holistic definition of health and the concept of health as a human right. However, both concepts have also been criticized as utopian and immeasurable, and few if any countries would meet both standards. In practice, the WHO focuses primarily on measures that benefit large numbers of people, particularly those who are poor or otherwise underserved, rather than on specific medical treatments that are delivered to individuals. Such efforts include promoting access to drugs such as antiretrovirals at a price that re-

> DOCTORS WITHOUT BORDERS

In 1971 a group of French doctors were working with the International Committee of the Red Cross (ICRC) during the Nigerian Civil War in the blockaded Biafra region. In response to the human rights abuses they witnessed and the rigid, silent neutrality of the ICRC, these doctors and journalists founded *Médecins sans Frontières* (Doctors without Borders, MSF). The MSF is an independent organization dedicated to providing emergency medical relief to areas affected by natural or man-made disasters, epidemics, or war. The MSF also maintains neutrality; its core belief is that regardless of race, religion, or political affiliation, every human is entitled to medical care. However, it is also MSF's policy to speak out against human rights violations when it is clear that medical aid is not enough. Over the years, MSF has developed an international standard model for compact disaster kits for surgery and obstetrics. MSF projects do not just provide immediate relief but also educate local staff and improve overall sanitation and facilities. The MSF played a major role in helping, among others, refugees in Cambodia in the 1970s, Ethiopian famine victims in 1984, and victims of war in Sri Lanka, Sierra Leone, Rwanda, Kosovo, and Darfur. The MSF won the Nobel Peace Prize in 1999.

—Sarah Boslaugh

flects a country's ability to pay. Public health measures such as disease surveillance, immunization campaigns, and education about and provision of family planning services play a large part in WHO efforts.

WHO efforts to improve public health sometimes place the organization in conflict with other authorities within a given country or area. To take one example, the WHO campaign to eradicate polio (begun in 1988) has sometimes been hampered by local politicians and clerics who oppose administration of the polio vaccine on religious or moral bases. For instance, an immunization campaign in Nigeria in 2003 was opposed by some Muslim clerics and local politicians on the grounds that the vaccine spread AIDS and caused sterility in women.

Similarly, WHO family planning and HIV-prevention campaigns often conflict with local

values: in the United States as well as less-developed countries, many political leaders have opposed making available effective measures of birth control and HIV prevention, such as the provision of latex condoms, on the grounds that ready availability of prophylactic measures will be interpreted as promotion of promiscuity. In addition, food aid programs have been criticized on the grounds that they undermine local agriculture and industry and upset the local economy. Critics also charge that such aid provides impetus for conflicts to continue in order that related profiteering (for instance, donated food being seized, relabeled, and sold at inflated prices in street markets rather than being distributed for free) may continue.

The WHO staff's understanding of the dynamic among poverty, education, and development is evident most clearly in their efforts to promote national and local development because conditions such as poor nutrition and lack of access to a clean water supply are endemic in underdeveloped countries and are major contributors to poor health. Yet the WHO also has been criticized, as has its parent body the UN, on the grounds that it is governed by an elite who are out of touch with the reality of the lives of those whom the WHO attempts to serve. Some critics feel that too many resources are spent on campaigns to promote smoking cessation or seatbelt use that are irrelevant to countries where the greatest immediate threats to life include warfare and waterborne infections. WHO reliance on Western technology, including pharmaceuticals and manufactured goods such as mosquito nets, has also been criticized as not sustainable in poor countries. Counterbalancing these criticisms, many WHO recommendations (for instance, immunization schedules) include consideration of available national resources, and the WHO has endorsed the use of indigenous medicine and medical practices since 2000.

Disabled Rights

The term “disabled rights” in its widest sense signifies social, political, and human rights efforts to combat discrimination against persons with disabilities and to secure for them the same rights and opportunities as able-bodied persons. More narrowly, the term denotes the legislation that recognizes and establishes these rights. International recognition of these rights first came in 1971 when the United Nations (UN) adopted the first document on disability rights, the Declaration on the Rights of Mentally Retarded Persons, followed in 1975 by the UN Declaration of the Rights of Disabled Persons and culminating in the UN Convention on the Rights of Persons with Disabilities of 2006. In the last decades, persons with disabilities have achieved greater independence, integration, and productivity in many societies, though national strategies continue to vary significantly according to a nation's economic resources, political motivations, and social and cultural values and norms.

The current international attention underscores the special status of disabled persons historically as victims of discrimination. In North America, Britain, and Scandinavia, disabled persons were discriminated against during the eugenics movement (1890–1940) with laws requiring compulsory sterilization of those considered genetically inferior. In Nazi Germany, an estimated 250,000 physically and mentally disabled children and adults were killed in gas chambers and by lethal injection (euthanasia) under the so-called T-4 extermination program between 1939 and 1945. After World War II and following the exposure of Nazi atrocities, views on sterilization as a way to combat disability went out of favor, though sterilizations of persons with disabilities continued in some parts of the United States through the mid-1970s.

From the 1960s onward, a burgeoning disability rights movement took root and flourished in the United States. Encouraged by the Civil Rights Act of 1964, which had guaranteed civil rights to African Americans and women, parents of disabled children now demanded that their children be taught in the same class as non-disabled ones (a process known as mainstreaming). Such efforts led to a series of laws that favored the integration of disabled children in the classroom, such as the Rehabilitation Act of 1973 and the Americans with Disabilities Act (ADA) of 1990. Also in the 1960s, the independent-living movement began at the University of California, Berkeley, where Edward Roberts, a student confined to an iron lung, wanted to attend classes and successfully petitioned to do so. His efforts led to the establishment at Berkeley in 1970 of the Physically Disabled Students Program (PDSP) that organized volunteers who helped disabled students with finding wheelchair-accessible apartments, prepared meals, or pushed wheelchairs. This process to integrate persons with disabilities into everyday life became known as inclusion. Subsequently, in developed countries, mainstreaming and inclusion became the two goals of the worldwide disability movement.

In the 1990s, the disability rights movement branched out across the world, and more countries passed national legislation to promote the rights of the disabled. Industrialized countries such as Australia, Austria, Britain, Finland, Germany, Hong Kong, and Japan adopted laws or amended their constitutions to prohibit discrimination on the basis of disability. In the Netherlands, for example, school-aged children with serious disabilities are given the choice between registering for Special Education and attending a mainstream school. Those who attend a mainstream school receive a personal budget to offset tuition for trained teachers. Laws prohibiting discrimination against persons with disabilities were also adopted in some developing countries, including Brazil, China, Malawi, the Philippines, South Africa, and Uganda. To promote greater awareness of the rights of the disabled, the UN in 1992 declared that 1993–2002 would be the Asian and Pacific Decade of Disabled Persons, followed by the African Decade of the Disabled Person (2000–2009).

➤ DISABILITY AS HUMAN RIGHTS ISSUE

On December 13, 2006, the United Nations (UN) General Assembly adopted the Convention on the Rights of Persons with Disabilities and its Optional Protocol (of measures to implement the convention), at the UN Headquarters in New York. As of 2008, a total of 139 countries have signed it, and 51 have ratified it. The convention establishes disability not only as a matter of social welfare but also as an issue of human rights and a matter of law. The rights recognized by the convention include transport, employment, information technology, education, health, and justice. Article 1 of the convention states:

“The purpose of the present Convention is to promote, protect and ensure the full and equal enjoyment of all human rights and fundamental freedoms by all persons with disabilities, and to promote respect for their inherent dignity.

Persons with disabilities include those who have long-term physical, mental, intellectual or sensory impairments, which in interaction with various barriers may hinder their full and effective participation in society on an equal basis with others.”

—Angela Matysiak

As of 2009, approximately 650 million people with disabilities lived around the world, an estimated 10 percent of the world's population. Eighty percent of those lived in the developing world, where resources are often scarce and stereotypes remain. In these regions, widespread poverty and social discrimination often conspire against the rights of persons with disabilities. Thus, many challenges remain for Euro-American concepts of inclusion and mainstreaming to be transferred successfully from the industrialized to the developing world.

—Angela Matysiak

Torture in Contemporary History

While post-World War II United Nations' conventions and proclamations condemning torture—the violent physical or psychological abuse of prisoners to coerce or punish—were prevalent, the practice has continued well into the present. Throughout the Cold War, torture was used not only by the two main ideological adversaries in the conflict but also by the newly created countries of the world undergoing decolonization from the former European empires. In the post-Cold War period, allegations and public debates over what constitutes torture have reemerged, particularly in the allegations of the U.S. military and its contractors' use of torture in Abu Ghraib prison in Iraq and Guantanamo Bay prison in Cuba.

After World War II, as the Allies imposed their rule over vast regions of the former Axis empires in Europe and East Asia, many of the local resistance movements, emboldened by the presence of Allied troops, began to engage in acts of retribution against collaborators. Many of these collaborators, some of whom had been active in the quisling government in power (i.e., Vichy France, Fascist Italy) during the period of occupation and others who were merely waiting the war out, quietly working within the system, were subjected to lynching, public humiliations (shaved heads, floggings, beatings, etc.), and trials before partisan courts. Often through acts of coercion, collaborators were forced to confess to crimes that immediately condemned them to death.

In the newly created Eastern Bloc, coercive police states instituted by native Stalinist regimes also began to condemn and punish individuals deemed enemies of the state. These newly created People's Republics of Eastern Europe relied

on Stalinist tactics of imprisonment, forced labor, and psychological torture to extract information, enforce compliance, and destroy political resistance. In the Soviet Union itself, the expansion of the Gulag prison system, already notorious for imprisoning millions of political prisoners, now also included vast numbers of alleged traitors returning from Western Europe, mostly Soviet prisoners of war (POWs) and Red Army soldiers who might have “been exposed to the capitalist practices of the West.” Psychological coercion, such as sleep deprivation and continuous interrogation, served to break the will of informants and to ensure a constant supply of allegations against others. Innovations in torture, mostly using techniques that did not inflict bruises or scars, became common as early as the Great Purges of the 1930s in the Soviet Union.

European powers' attempts to stave off decolonization also added to incidents of and innovations in torture. For example, the French use of torture during the Algerian War (1954–1962), most notably through the use of electrical shocks, incensed world opinion. As with the Soviets' techniques, the French military's techniques revolutionized the role of torture in war as a means of gathering intelligence and subduing local populations.

During the Cold War's numerous proxy wars in Latin America, Asia, and Africa, both superpowers made arrangements with armed factions that instituted police states, which inflicted terror on their domestic populations. The U.S. support for anticommunist regimes such as that of Augusto Pinochet in Chile, Mohammad Reza Pahlavi in Iran, and the Somoza dynasty in Nicaragua, all of which actively participated in torture and acts of repression against the population and its left-wing oppositions, did much to discredit American standing in the developing world. Resistance forces that battled U.S.-supported regimes in many developing countries also practiced torture on their own captured victims (i.e., Congo, North Vietnam, North Korea).

The Soviet Union and the People's Republic of China also maintained internal police state apparatuses that continued various forms of repression and violence against their own citizens. Mao Zedong's Cultural Revolution was an instance whereby the state was an active agent in encouraging the population to weed out dis-

sidents and traitors to their ideology. Lesser communist powers, such as Cuba, Vietnam, and Cambodia (especially the Khmer Rouge), also used coercive tactics, including torture, to enforce domestic conformity to the regime.

In the post-Cold War era, increasing fears of domestic terrorist attacks in Western countries have raised the issue of whether or not torture is an acceptable method to extract information from captured terrorists. Recent scandals surrounding the U.S. military's use of coercion to humiliate or extract information from prisoners in Abu Ghraib (2004) in Iraq and allegations of the use of torture through the practice of waterboarding (which invokes a feeling of drowning in victims) in Guantanamo Bay in Cuba has made this a contentious issue. Proponents of waterboarding have argued that it does not constitute bodily harm and assists in acquiring information that might save hundreds of lives, while opponents argue that it violates human rights and ignores the U.S. commitment to the high ideals of protecting individuals from such practices.

➤ AMNESTY INTERNATIONAL

Founded in 1961, the British-based international nongovernmental organization Amnesty International is dedicated to publicizing and ending human rights abuses in the world. Furthermore, it also works toward bringing violators of such rights to justice. Drawing attention to human rights violations via massive advertising campaigns and working in tandem with other international organizations such as the United Nations, Amnesty International has been successful in addressing the issue of torture. In the 1960s and 1970s, Amnesty International was active in attempting to secure the release of political prisoners in South Africa and the *desaparecidos* ("disappeared") in Latin America and to end torture practices in the developing and socialist worlds. In the 1980s and 1990s, Amnesty International worked to address the plight of refugees and genocide (Yugoslavia, Rwanda, and the Congo) in addition to continuing to work against torture. However, countries such as the Soviet Union, Argentina, and Israel were critical of the organization, accusing it of bias against their policy objectives and internal problems. In recent years, while Amnesty International continues to work against human rights violations, many world governments (the United States, China, Israel, Saudi Arabia, etc.) view it as infringing on their ability to conduct internal policing and accuse it of hindering the prosecution of internal unrest and crime through its influence on global opinion.

—Abraham O. Mendoza

■ Introduction: Indigenous Groups and Sovereignty

Since the time of Columbus's voyages, indigenous peoples throughout the Americas, the Caribbean, and Oceania have been subjected to colonization and the annexation of their lands, largely on the part of European nations and the United States. The extent to which colonizing powers infringed upon the autonomy, social organization, and cultural practices of indigenous peoples varied considerably. While indigenous groups in the United States, Australia, and New Zealand, for example, were subjected

to forced relocation, forced assimilation, and outright extermination, indigenous peoples in some island nations of the Pacific retained control of significant portions of their lands and maintained traditional forms of authority and social organization. Domination and control of indigenous peoples was not unique to the European colonial project. For example, the Ainu on the island of Hokkaido have been under the control of Japan since 1799, while the Turkic Uyghur population has been under China's control (in the

northern province of Xinjiang). In Iran, the Bakhtiyaris have had a contentious relationship with the state since their traditional authority was dismantled in the 1920s and 1930s under Reza Khan.

In the period following 1945, many indigenous groups have gained greater political autonomy and influence throughout the world. Several island nations in the Pacific, such as Nauru, Papua New Guinea, and Fiji, have gained full independence, while other island nations have retained a dependent status with the colonizer nation with relative political autonomy. In Latin America, indigenous groups have been more successful in gaining political representation and exerting influence within the national body politic (including suffrage rights for the first time in Peru, Ecuador, and Colombia). Indeed, mobilization among indigenous groups in Latin America has resulted in the election of Bolivia's first indigenous president, the removal of a president in Ecuador, and congressional representation for the indigenous in Colombia, among other key victories. Indigenous groups in Canada, Australia, and New Zealand have also gained some measure of political representation. Canada has made a radical shift in policy during the latter half of the twentieth century, from considering the appropriation of indigenous lands to acknowledging the political autonomy of indigenous peoples as nations and providing programs that support indigenous self-government and economic self-sufficiency. Australia has established a governmental body to provide indigenous groups representation at the national level as well as economic aid for indigenous infrastructure, while New Zealand established a tribunal to address treaty claims of Maoris. Meanwhile, organizations such as the National Congress of American Indians and the radical American Indian Movement have brought national attention to the plight of indigenous groups in the United States, although the Alaska Native Claims Settlement Act (1971) and a host of Supreme Court decisions under former chief justice William Rehnquist have further eroded the already tenuous sovereign status of Native American tribes.

Another significant development among indigenous groups during this period is the resurgence of indigenous identities, both as an increase

in the number of individuals claiming indigenous identity and the emergence of pan-indigenous coalitions and identities, both on a national and transnational scale. Political coalitions among once disparate indigenous groups have been forged in an effort to compel governments to recognize treaty claims of indigenous groups or improve their economic conditions, to assert political autonomy, or to preserve indigenous cultures and customs, among other objectives. Indigenous organizations, coalitions, and social movements have brought greater visibility to the cultural and structural subordination of indigenous groups, generated pride and reduced the stigma historically attached to indigenous identity, and compelled many individuals to acknowledge and affirm indigenous ancestry.

Despite the significant political gains of indigenous groups in the late twentieth century and the resurgence of indigenous identity, many indigenous communities continue to lack material resources for self-sufficiency and experience lower levels of educational attainment, inferior or substandard housing, and lower life expectancies. Even island nations that have gained political independence continue to rely heavily on foreign aid and retain economically dependent relationships with Europe and the United States. Yet many indigenous groups continue to maintain organizations and even transnational coalitions in an effort to exercise political autonomy, improve economic conditions, and maintain traditional cultures.

—Josef Castañeda-Liles

Indigenous Peoples of North America, Post-1945

In the aftermath of World War II, North American Indians lost lands and political and cultural sovereignty as a result of concerted liberal efforts to assimilate them into national identities. By the 1960s and 1970s, Indians throughout the continent rejected forced assimilation and reversed many detrimental policies by organizing to confront or circumvent state authority. Pan-Indian activism grew internationally in the 1980s and 1990s as Native American leaders increased global awareness of Indian realities by arguing for self-determination in international forums and

➤ AMERICAN INDIAN MOVEMENT

In the late 1960s and early 1970s, the American Indian Movement (AIM) came to symbolize social discontent and political resurgence throughout Native America. Arguably the most renowned activist organization in Indian Country, AIM emerged initially in response to local problems facing urban Indians and later orchestrated national media events before splintering due to pressure from the federal government and internal tensions.

AIM was formed in July 1968 in Minneapolis, Minnesota. A Pan-Indian movement from the start, its early members included Ojibwes Dennis Banks, Clyde Bellecourt, and Eddie Benton-Benai and Lakota Russell Means. Initially, it directed its efforts at monitoring local law enforcement and combating police brutality in Minneapolis. To this end, it formed citizen patrols and rapid response teams that were dispatched to reported crime scenes to document police behavior. In keeping with empowerment movements in other communities of color, AIM directed many of its energies at cultural preservation and protection from police brutality. Importantly, it also connected calls for self-determination with a broader movement in Indian Country to reassert tribal sovereignty. Consequently, it undertook actions meant to reclaim and promote positive futures by combating anti-Indian stereotypes, establishing schools, and making connections with international groups.

In keeping with other political movements, AIM took its struggles outside the corridors of power and staged evocative public events meant to capture media attention and reframe social opinion. In the early 1970s, AIM undertook a series of increasingly visible protests to highlight historic wrongs, failed policies, and the social plight of American Indians. These actions, often in concert with other Native American activist groups, included the disruption of events associated with the 350th anniversary of the arrival of the Pilgrims at Plymouth; the occupation of Mount Rushmore and later the Bureau of Indian Affairs office in Washington, D.C.; and a transcontinental march dubbed the Trail of Broken Treaties in 1972. Most dramatically, in 1973 members of AIM participated in the takeover of Wounded Knee, South Dakota, to combat corruption and violence on the Pine Ridge Reservation. The occupation soon involved federal agents and escalated into an armed standoff that concluded with a deadly shootout between the FBI, which had long targeted the group, and members of AIM. A contested trial followed and resulted in the conviction of Leonard Peltier; many critics have argued that the trial was fraudulent. Subsequently, AIM's influence began to wane. In the early 1990s AIM fragmented, creating smaller and competing factions that, despite their ideological differences, have remained active in advocacy for Native American rights.

—C. Richard King

global advocacy networks. This strategy of seeking international solutions for local concerns continued into the twenty-first century but with a renewed focus on integration into state structures of local authority.

The post-World War II assault on tribal sovereignty was most immediate and dramatic in the United States. Cold War conformity was the norm, and distinct Indian cultures and the reservation system came to be seen as separatist and un-American. Postwar Indian policy, therefore, reversed a trend toward cultural pluralism advocated earlier by Commissioner of Indian Affairs John Collier (1933–1945) and the Indian Reorganization Act of 1934. A 1953 joint congressional

resolution ushered in the new era with a call for the immediate integration of Indian peoples and an end to all federal relations with Indian tribes. The policy of termination freed the federal government from earlier treaty and trust obligations and freed Indians to fend for themselves as members of a more uniform American society. Termination proved disastrous for Indian peoples of the United States. Whole tribes were absorbed into state jurisdictions, and tribal lands and resources were sold to the highest bidder. The Menominees, the Klamaths, the Alabamas, and the Coushattas of Texas, among others, lost tribal status during the period, and more than 1 million acres of native lands fell into private hands.

► PAN-INDIAN MOVEMENT

Pan-Indian activism became an international movement in the 1970s. Through institutions such as the World Council of Indigenous Peoples (WCIP), founded in 1975, North American Indians gained a voice in the United Nations and the support of indigenous peoples around the globe. During this period, Pan-Indian organizations rejected state authority by drawing on the Fourth World ideology of George Manuel, WCIP founder and president of Canada's National Indian Brotherhood. Manuel saw tribal collaboration with respective nation-states as fruitless endeavors and promoted instead the circumvention of state authority through supranational organizations. By the 1980s, the Fourth World approach to Indian activism had fallen out of fashion as politically motivated organizations used the ideology to incite indigenous groups to separate from states in places such as Nicaragua and Guatemala, not as a real solution to indigenous problems but with the purpose of undermining popular movements such as the Sandinistas and the Guatemalan opposition.

—Eric Rodrigo Meringer

Group of Sioux Indians protest at Alcatraz in an attempt to claim the land under the allowances provided in an 1868 treaty with the U.S. government, March 8, 1964. (Bettmann/Corbis)

The Canadian government, which had sought to streamline its dealings with Indians since the Indian Act of 1951, proposed its own version of termination in the “Statement of the Government on Indian Policy, 1969,” also known as the White Paper. The White Paper called for dissolving the governmental department in charge of Indian affairs, granting titles to Indian lands, and turning over to the provinces the administration of education, health, and other services. Opponents drew comparisons to the unpopular U.S. policy, and the Pierre Trudeau administration backed away from the White Paper proposal within a year.

Resistance to termination and the White Paper fueled Indian activism and launched the modern Indian movement for self-determination throughout North America. In the United States the National Congress of American Indians (NCAI) gained strength and purpose by opposing termination and pressured the Dwight D. Eisenhower administration to overturn the unpopular policy by 1958. In Canada, Indians organized under the National Indian Brotherhood worked with the government and in 1973 gained funding and control of reserve schools for Indian band governments. Efforts to gain self-determination and observance of Indian treaty rights in the United States were more militant. Dramatic confrontations at Alcatraz, at the Bureau of Indian Affairs offices in Washington, and at Wounded Knee in South Dakota brought Indian issues into the mainstream and won the Red Power movement widespread support in the United States and abroad.

In contrast to U.S. and Canadian efforts that sought to, in the vernacular of the period, get the government “out of the Indian business,” Mexico, which was a model for Indian-state relations throughout Latin America between the 1940s and 1970s, increased expenditure and governmental involvement in Indian affairs during the same period. With the largest indigenous population on the continent, Mexico derived its Indian policy from the twentieth-century ideology of indigenism in which Indian language and culture were celebrated as essential components of national mestizo identity. Celebrating indigenous pasts did not, however, ensure space for

indigenous futures, and institutionalized indigenism, as promoted by Mexico's Inter-American Indigenist Institute (1948), sought to accelerate what policy makers saw as the inevitable decline of Indian culture in the face of modern political and economic development.

Although Mexico's Indian policy was assimilationist in nature, indigenist programs did nonetheless offer tangible benefits to isolated indigenous communities. Unlike termination that sought to unravel the reservation system and promote urbanization, Mexico's indigenist policy aimed to integrate its indigenous population by bringing the modern state, in the form of highways, railroads, and televisions, to the isolated indigenous community. Mexico's National Indigenous Institute set up administrative centers among the rural Tzeltal-Tzotzil of Chiapas, the Tarahumara of Chihuahua, and the Mazateca, Chinanteca, and Mixteca of Oaxaca. Success was measured not in terms of terminated programs but by the introduction of new schools, clinics, showers, and electrification. Indian leaders in Mexico and Central America therefore gained certain advantages by working within the existing system. The spread of Pan-Indianism in the 1970s provided an alternative system in which Indian peoples could both seek the benefits of modernization and resist assaults on indigenous cultural sovereignty.

Since the 1990s, Indian movements continue to seek rights for indigenous groups as distinct peoples as opposed to ethnic minorities. At the same time, they acknowledge the diversity of indigenous concerns and the state's ability to mediate the impact of global political and economic change on isolated indigenous communities.

Indigenous Peoples in Latin America, since 1945

The phrase "indigenous people" refers to the descendants of the aboriginal inhabitants of the Americas, alternatively known by a variety of labels including Indians and natives. However, these colonial and globalizing terms mask the wide diversity of languages and cultures that have flourished across the region. Defining who is an Indian is a complicated question in Latin America, particularly given the varying degrees of cultural and biological mixing that have occurred over the past 500 years since the Spanish Conquest. Anthropologists have typically used external characteristics such as language, clothing, residency, occupation, and religious practices to determine ethnic affiliation. Depending on definitions, about 40 million people, or about 10 percent of the population, is indigenous, with the majority concentrated in southern Mexico, Central America, and the Andes. Identity remains overwhelmingly local, and many indigenous peoples identify with their own group rather than with a pan-ethnic construction. Although past observers had predicted the disappearance of indigenous peoples, at the beginning of the twenty-first century their cultures remained strong and vibrant.

► INDIGENOUS POPULATIONS OF THE AMERICAS

The size of indigenous groups in the Americas has been a hotly contested issue from the time of the European conquest to the present. Most famously, at the time of the Spanish Conquest Father Bartolomé de las Casas placed the aboriginal population of Hispaniola at 4 million inhabitants. Some scholars have criticized his statement as an inflated estimate of an overzealous defender of indigenous rights designed to emphasize the abuses of the Spanish colonists. Subsequent demographers have lent more legitimacy to his figures. The cultural and biological mixing of indigenous peoples, Africans, and Europeans in the Americas has made it difficult to determine the ethnic category of Indian. Individuals can slide back and forth between categories based on varying criteria, definitions, and the political expediencies of the moment. Following the 1994 Zapatista uprising in Chiapas, for example, the percentage of Mexicans willing to identify themselves as indigenous doubled. The following numbers, therefore, are only a rough guide to the distribution of indigenous peoples throughout Latin America and should not be taken as an accurate and scientific determination.

Country	Indigenous Peoples (Millions)	Percentage Indigenous
Argentina	0.41	1.1
Bolivia	4.92	60.0
Brazil	2.67	0.2
Chile	1.07	7.0
Colombia	0.78	2.0
Ecuador	2.20	17.2

Quehacer, reprinted in *Latinamerica Press*, April 16, 2001, p. 7.

Indigenous peoples, with populations based in rural areas, had long been marginalized from mainstream politics and economics. Elites descended from European conquerors controlled most of the profitable arable land, with Indians crowded onto small and degraded plots. Indians suffered from malnutrition and a lack of health care, resulting in high infant mortality rates and short life expectancies. Most Indians did not have access to education, and governments used their illiteracy as a mechanism to deny them the vote. Indigenous peoples were only first allowed to vote in Peru in 1978, in Ecuador in 1979, and not until 1991 in Colombia.

The late twentieth century witnessed a heavy migration away from indigenous rural areas and toward urban areas that were traditionally white spaces. This did not necessarily correspond with an erosion of ethnic identities. Urban areas could be politicizing spaces as Indians who faced common issues and concerns met. Gaining a univer-

sity education provided organizing tools that facilitated a politicized ethnic agenda. Similarly, in recent decades large numbers of indigenous communities have converted to evangelical Christian religions. Guatemala, for example, is now heading toward a Protestant majority. Commonly critics have assumed that this would lead to an erosion of ethnic identities, but often, instead, the adoption of evangelical Christianity created spaces in which to preserve indigenous cultures. When missionary groups, for example, translate their Bibles into local languages, it helps to reinforce and valorize ethnic identities.

Numerically speaking, the largest surviving indigenous groups in the Americas are the Maya and the Quechua. Both are language families that include diverse cultures and traditions spread over a broad geographic area. In Guatemala the country's small nonindigenous elite held a monopoly on economic and political power. In the 1980s the Guatemalan military launched a geno-

cidal war against the country's majority Maya population. In 1992 Maya leader Rigoberta Menchú, who had become widely renowned for her testimonial *I, Rigoberta Menchú*, won the Nobel Peace Prize for her defense of indigenous rights in the country.

In neighboring Chiapas, Maya rebels shocked the world on January 1, 1994, with an armed uprising against the Mexican government. Organized into the Zapatista Army for National Liberation (EZLN), so-named after Mexican Revolutionary hero Emiliano Zapata, their demands were much broader than indigenous rights. Led by 12 Maya *comandantes* (commanders) and a charismatic nonindigenous Subcomandante Marcos, who also served as spokesperson, the rebels demanded an end to neoliberal economic policies that robbed them of their lands and livelihood.

Quechua peoples thrive along the spine of the Andean mountains on South America's Pacific coast. Bolivia has the highest density of indigenous peoples in the Americas and has long been home to the cultivation of coca leaves used for medical and ritual purposes. Because coca is also one of the raw ingredients in the production of cocaine, this cultivation was targeted in a so-called war on drugs. Indigenous farmers defended their right to grow coca. Coca leader Evo Morales won the presidency of the country in 2006 as the candidate of the Movement to Socialism Party, becoming the first indigenous person to be chief executive in that country.

Indigenous organizations in Ecuador formed one of the continent's best-organized social movements. Beginning in the 1920s they worked together with leftist political parties to agitate for land, education, political recognition, and other rights. They gained newfound visibility in 1990 when they launched a peaceful uprising against the government. Led by the Confederation of Indigenous Nationalities of Ecuador (CONAIE), militants demanded social, economic, and political changes, including changing the constitution to recognize the pluri national nature of the country. Indigenous activists commonly used marches, strikes, and road blockades to press their demands. In 1995 CONAIE founded a political party called Pachakutik to run candidates for office. They realized some electoral success but often had more impact as a social movement, in-

cluding the use of street protests to force President Jamil Mahuad from office in January 2000. In Ecuador and elsewhere, indigenous peoples emerged at the head of popular struggles against neoliberal economic reforms that shifted resources away from a country's poorest peoples.

Environmental issues often have become key to indigenous struggles for survival. Amazon indigenous groups are more diverse and dispersed than those in the core Maya and Andean areas. European conquerors had less success in subduing the Amazon, and some isolated groups still have little or no contact with the dominant culture. In 1993 the Cofáns, Secoyas, and Sionas in the Ecuadorian Amazon sued Texaco in New York for polluting their lands. In Brazil the Kayapós used modern technology such as video cameras in their struggles against the damming of the Xingu River. They gained an international profile when British rock star Sting rallied to their cause.

For centuries indigenous peoples have used state structures to petition for redress and in recent decades have gained notable successes. In 1987 Miskitu Indians on Nicaragua's Atlantic coast signed an autonomy agreement with the leftist Sandinista government. Even though Colombia has one of the smallest indigenous populations in the Americas, well-organized social movements gained significant concessions in the 1991 constitution including recognition for their territory and cultures and representation in congress. Similarly in Venezuela, many indigenous rights were codified in the 1999 constitution, including recognition of their languages, organizations, and lands. Political openings have ensured rights for indigenous peoples, facilitated their survival, and even helped them to flourish in the early twenty-first century.

Indigenous Groups of Oceania since 1945

The indigenous ethnic groups of Oceania consist of Aboriginal Australians (along with Torres Strait Islanders), the Maoris of New Zealand, the peoples of the Melanesian and Micronesian archipelagos, the Polynesian groups of the South Pacific, and the various peoples who constitute Papua New Guinea. After World War II, many of these indigenous ethnic groups attained varying levels of autonomy from their respective colonizing powers, with outright independence in some

cases. Most of the Polynesian island groups, most notably Fiji and the Solomon Islands, attained their independence from their European colonizers. In contrast, the indigenous peoples of Australia and New Zealand remained under the political control of their respective colonizer governments but attained higher levels of autonomy vis-à-vis the state with mixed results in terms of economic and social advancement. The indigenous peoples of Oceania share in common various traits with other indigenous peoples in other world regions, especially in regard to their social and economic position relative to the former (or current) colonizing power.

Many of the postwar Pacific island nation-states in the Oceania region were originally populated by Polynesian, Melanesian, and Micronesian peoples before European colonial expansion brought many of these under their control in the late nineteenth century. However, during the late twentieth century many of these former colonial holdings attained their independence and were formed into viable nation-states (i.e., Fiji, the Solomon Islands, the Federated States of Micronesia, the Marshall Islands, Nauru, Palau, Samoa, Tonga, and Vanuatu). Other Pacific islands remained under the control of a Western imperial power (i.e., Australia's Christmas Island, Cocos Islands, and Norfolk Island; U.S. New Caledonia, Guam, and American Samoa; New Zealand's Cook Islands; British Pitcairn Islands; and French Polynesia) with the indigenous people granted citizenship within the metropolitan power. Indigenous people in Australia and New Zealand were incorporated as part of the national body politic with a level of autonomy in respect to indigenous rights. Finally, until 1975 Australia administered Papua New Guinea, when its disparate ethnic groups formed a unified national state.

Many of the newly independent Pacific nation-states, consisting mostly of indigenous populations, have had various instances of political and social problems in the wake of independence. States such as Papua New Guinea, the Solomon Islands, and Micronesia have been fraught with political discord, widespread poverty, and other problems. Australia and New Zealand, the most developed states of the region, have intervened militarily in local conflicts and

➤ ACKNOWLEDGING THE PAST—RESTITUTION TO OCEANIA'S INDIGENOUS PEOPLES

Given centuries of colonization and exploitation, Oceania's indigenous peoples have clamored for greater political representation and the rectification of past wrongs from colonizers. The U.S. and Australian governments have recently apologized to their indigenous peoples for such past policies. The U.S. government formally apologized to native Hawaiians in 1993 when President Bill Clinton signed the Apology Resolution for the overthrow of the Kingdom of Hawaii in 1893 and its subsequent annexation as a state in 1898. Certain provisions granted to Native Americans have been granted to native Hawaiians, with legislation pending that would grant them the same legal status. In 2008 the Australian government, under the leadership of Prime Minister Paul Rudd, apologized to indigenous Australians for the "stolen generation" policies of the early twentieth century. However, he was subsequently heavily criticized for not including financial reparations in tandem with his apology.

—Abraham O. Mendoza

crises and have also contributed heavily in terms of humanitarian aid. However, states such as Fiji have developed their local economies based on tourism, drastically changing social conditions for many. The indigenous peoples under foreign rule in places such as French Polynesia and American Guam, while having been granted certain levels of political representation and rights, still suffer economic deprivation and social inequality in comparison with their governing elites (such as continental Americans in Samoa). Likewise, Australian aboriginals in Australia, while having attained financial, territorial, and political compensation from the Australian government, still suffer from discrimination, poverty, and high levels of illiteracy and drug and alcohol abuse. This situation contrasts with the position of the Maoris in New Zealand, who along with political representation and social equality granted by the state of New Zealand have prospered in the past half century.

Nomadic Peoples and Modern States

The rapid modernization of much of the world from the twentieth to the early twenty-first century has had a severe impact on nomadic peoples in Asia, Africa, and Europe. Their relationship with evolving nation-states in the post-colonial world has had significant impact on their livelihood and traditional way of life. The expectation by their respective governing nation-states of these nomadic groups' gradual settlement into sedentary communities has had mixed results. Ranging from Central Asian pastoralists, Middle Eastern Bedouins, African tribes, and the Romani (Gypsies) in Europe, nomads have encountered drastic changes in their traditional social and political structures due to the intrusion of the global economy, local governments, and regional warfare.

➤ IRANIAN NOMADS

Traditional Iranian nomadic societies, although declining in numbers, still remain an important social group in Iran. Many still practice traditional methods of pastoralism, driving their herds between summer and winter pastures and selling animal products to the local populations. It is estimated that 30 percent of Iranian meat production comes from these groups. Although many of the people traditionally associated with these societies have become sedentary in response to growing industrialization and the loss of traditional grazing lands, it is estimated that there are still 1.4 million pastoralists, approximately 2 percent of the population. This is a far cry, however, from previous centuries, when their numbers varied from a quarter to half of the total population. Although most of the nomads played only a small part in the Iranian Revolution, traditional leadership was often targeted by the new government as monarchist supporters. Some notable pastoralist societies include Bakhtiari, Baluks, Qashqui, Shahsevan, and the Turkmen.

The adaptation of mobile pastoralists into the modern world results in their occupation of a marginal and inferior economic and social position within greater society due the constraints imposed on their way of life by the nation-state. In the period of decolonization following the end of World War II, most nomads found themselves dependent on the newly developing nation-states of the so-called Third World, eager to modernize themselves to compete in the world market. Particularly in Africa and the Middle East, nomads such as the Bedouin of Arabia, the Ababdeh of Egypt, and Kurds in Central Asia saw the incursion of the nation-state in their day-to-day lives in the forms of the construction of modern infrastructure such as roads, in businesses, and in the development of natural resources. Nomads within the Soviet Union such as the Kyrgyz and the Turkmen in Central Asia had already been forced by the Soviet authorities into sedentary societies. Similarly, global nomadic societies in the postwar era were expected to adapt to the contingencies of economic development, but many continued their way of life on the margins

of society. However, dwindling resources in the form of grazing lands for their livestock and a decline in readily available markets for their goods due to the intrusion of commercial goods created by the industrialized world market, such as finished leather goods and woolen clothing, forced large numbers of them to adapt to sedentary communities within the political nation-state.

The development of the nation-state in the postwar period became a widespread phenomenon following the era of decolonization throughout much of the Third World. In the midst of all these changes, drastic programs for modernization were implemented, funded by foreign investment and international organizations such as the World Bank and the International Monetary Fund. The political elites, European trained and educated, of these new countries sought to rid their countries of “backward” and traditional elements that might impede the economic progress of their new states. Nomads in the Middle East found themselves increasingly marginalized in society, given the prominence of the oil industry throughout much of the landscape as well as the rapid change in the market structures in the country that they depended on for subsistence. Central Asian nomads found less and less grazing lands for their livestock, and many were forced to move into sedentary communities, altering their lives drastically. African nomads, such as Bushmen from Southern Africa, Mbuti (pygmies) from the Congo, and the Tuareg in the Sahara became surrounded by tight borders that closed their traditional range of free movement. While colonial borders had been quite permeable, the newly emergent postcolonial states restricted and closed border crossings, forcing many to reside as minority groups within hostile countries. Much like the Soviet nomadic peoples of Central Asia, all these groups had to adapt to sedentary lifestyles or be forced to continue as pastoralists on land that was becoming scarcer due to state and private claims.

Nomadic groups maintaining traditional lifestyles have to cope with increasing difficulties with few advocates of their own, relying on the United Nations (UN) and major nongovernmental organizations (NGOs) such as the International Red Cross and Amnesty International. Bedouin in the Middle East have found themselves adrift

among the various wars in that volatile region, dependent on government subsidies for survival in ever smaller geographical areas. Central Asian nomads in Kazakhstan, Kyrgyzstan, and Iran have attempted to retain their way of life in smaller areas, also having to rely on support from the regional government. Those who manage to adapt to sedentary communities find their folkways and customs disparaged and looked down upon by others and, in some cases, simultaneously romanticized. The continuance of some of their customs, such as blood feuds among Bedouin in the Middle East and Romani squatting in the United Kingdom, is prohibited by their respective national governments.

Indigenous People of the Caribbean since 1945

Taíno Indians of the Greater Antilles and Island Caribs of the Lesser Antilles have been inscribed in history as the first to suffer Spanish genocide in the Americas. Contrary to the expectations of Amerindian extinction that are to be found in a wide array of colonial and more contemporary writings on the Caribbean, the indigenous peoples of the Caribbean continue to be present in demographic terms, in nationalist symbolism, and in widely diffused rural cultural practices. A broadly overlooked constituency of the modern Caribbean, indigenous peoples in the region have engaged in political and cultural resurgence while experiencing heightened visibility within national societies and in international forums. Several factors may account for their emergence from the margins of colonial societies and their renewed self-assertions in the present. Among these factors one can include wider state recognition for indigenous communities in Belize and

the Lesser Antilles since obtaining political independence from Britain, increased coverage of Amerindian communities and issues since the 1960s and even more so since 1992, growing regional connections between indigenous communities, new forms of Amerindian political activism, nationalist reinterpretations of the Amerindian past, and in the last 20 years a small but growing body of scholarship.

There has been a resurgence of people self-identifying as indigenous. In St. Vincent the number of people self-identifying as Carib rose from 40 in the census of 1981 to 1,500 by 1991. In St. Lucia the 1991 population census had "Carib" as a category, chosen by 366 people; by 2001, 787 people volunteered to be formally registered as "indigenous." In Dominica, high fertility rates have led to a dramatic Carib population recovery, rising from 400 persons in the 1930s to 3,400 in the 1990s. In Trinidad and Tobago, with a formally organized and state-recognized Carib community in the borough of Arima unofficially numbering several hundred people, there are increasing numbers of Trinidadians in the rest of the country and abroad who are now self-identifying as Amerindian descendants. Among immigrants from Puerto Rico and the Dominican Republic in the United States, thousands are self-identifying as Taíno and joining any of several Taíno organizations that came into existence since the late 1980s.

States have recognized existing Carib communities in Dominica, St. Vincent, and Trinidad and Tobago. In some of the islands, nationalist intellectuals have seized upon Amerindians as symbolic if not actual ancestors whose struggle for freedom from colonial rule could be politically reinterpreted as part of the broader Caribbean struggle for independence.

A new political consciousness oriented toward self-determination and cultural rights has emerged in a number of communities in the region and in the North American diaspora. In Dominica, the term "Caribism" refers to this new political consciousness; the term "Garifunaduo" in Belize has a similar meaning. This consciousness is reflected in the creation of new political organizations. In Dominica, the Waitukubuli Karifuna Development Agency (WAKADA), the Kalinago Centre, and two dance groups focus on

THE AINU

The indigenous Ainu people of Japan live on the northern island of Hokkaido as well as on Sakhalin Island, the Kuril Islands, and the southern end of Russia's Kamchatka Peninsula. The exact location and circumstances of the Ainu's origins are unknown. The Ainu probably lived throughout most of Japan in ancient times, but the Yamato gradually pushed them northward. The government of Emperor Meiji (which lasted from 1868–1912) eventually took over Ainu territory, gave those lands to Japanese homesteaders, and forced the Ainu to become fishermen. The rights of the Ainu people were not recognized until Japan's post-World War II Constitution (1947). In 1997, the Japanese Diet (parliament) for the first time recognized the Ainu as an official ethnic minority. Today, most of Japan's 20,000 Ainu live on the northernmost island of Hokkaido and make their living by hunting, fishing, farming, and selling crafts to tourists. Physically, Ainu men have more facial hair than the Japanese, though their dark hair color is the same.

the preservation and development of the Carib culture. Where Taínos are concerned, the Indigenous Association of Puerto Rico was formed in the 1980s along with several other organizations such as the Taíno Nation of the Antilles and the United Confederation of Taíno People. The Amerindian Peoples Association and the Guyanese Organization of Indigenous Peoples are two of the leading multiracial bodies in Guyana. The National Garifuna Council and the World Garifuna Organization have been formed in Central America. In some territories, there is more or less direct representation of indigenous leaders in local and national governmental bodies.

A unique convergence of factors has afforded contemporary Caribbean indigenous peoples a presence they have not had since the first century

► THE CARIB RESERVE

Caribs in Dominica have struggled to achieve a status that some national political elites find unsettling. The reinstatement of a formal Carib Reserve in 1978 provided a platform for conflict between Carib leaders and the state. Late prime minister Eugenia Charles asserted in 1987 that “no state within a state” would be tolerated. She also sought to expel international aid agencies working in the Carib Reserve. Major points of contention have been repeated efforts by the Carib Council to expel Afro-Dominican male spouses of Carib women from the reserve’s communally held lands, the rise of “Caribism,” successive administrations’ attempts to undermine and control the affairs of the Carib Council, and disputes over the boundaries of the reserve. Caribism promotes greater Carib political autonomy as a main objective along with educational reform, the establishment of independent international linkages to facilitate Carib economic development, and the revitalization of Carib cultural heritage. In 2006, the Kalinago Barana Auté, a Carib model village designed for cultural tourism, was finally opened in the Carib Reserve after three decades of planning and investment. In addition, in a debate that is echoed elsewhere in the Caribbean, some sectors of the national population are calling for the name of Dominica to be changed to its original indigenous name, Waitukubuli (“how tall is her body”) as a symbolic means of undertaking cultural decolonization.

—Maximilian C. Forte

of colonial rule. Transnational factors that are responsible for this heightened visibility include local indigenous communities’ greater access to the international media, their presence on the Internet, and their ability to organize several Caribbean-wide indigenous gatherings. Several of these gatherings have been held in Arima, Trinidad (in 1992, 1993, 1995, 2000, and 2006), while several more, the Indigenous Legacies conferences organized by Dr. José Barreiro, were held in Baracoa, Cuba, from 1997 to 2003. From 1987, indigenous communities in Belize, St. Vincent, Dominica, Trinidad and Tobago, and Guyana were organized in their own regional body, the Caribbean Organization of Indigenous Peoples.

Important connections have also been developed between Caribbean indigenous organizations and Canadian First Nations, such as the Assembly of First Nations, the Assembly of Manitoba Chiefs, and the Federation of Saskatchewan Indian Nations.

Likewise in 1992, to commemorate the 500th anniversary of the arrival of Columbus, governments of the Anglophone Caribbean showcased surviving indigenous communities at the Caribbean Festival of Arts (CARIFESTA), hosted that year by Trinidad and Tobago. This provided official recognition of the Amerindian presence and offered Amerindians themselves a vehicle for further communication and coordination on a regional basis. Such inter-Amerindian exchange happened again with CARIFESTA in 1995 and 2006.

The national news media in several Caribbean states have been an important source of local recognition for the presence of indigenous communities, more than previously and perhaps in part due to Caribbean indigenous peoples’ international exposure. Members of various national diasporas who self-identify as indigenous and have encouraged others to do likewise or who are simply proud of Amerindian survival from a nationalistic standpoint have also been a new source of recognition. As individuals begin to broaden knowledge of their own genealogies and their cultural histories, many more are claiming Amerindian ancestry. This has been especially true of immigrants from Puerto Rico and the Dominican Republic in the United States, who have been at the forefront of the Taíno resurgence.

The indigenous resurgence in the Caribbean over the past three decades has not diminished certain critical, enduring problems. Problems of persistent poverty, cultural marginalization, and lack of political representation endure even as wider social awareness of the indigenous presence continues to be raised in the region’s media and, after a long absence, in international scholarship.

Indigenous Peoples of Arctic Regions since 1945

The Arctic Circle is the northern polar region of the earth. It extends from 66.33 degrees north to 0 degrees north at the North Pole and encircles the northern portion of the earth. Because of the extreme low temperatures, it is also one of the great cold desert regions of the world, making it difficult for humans to survive there. Since Antiquity there have been groups of indigenous people who have so mastered the climate and environment of the circumpolar regions that they have been able to maintain continuous cultures. However, over the past centuries, the development of modern survival gear and technological support has enabled people from temperate zones to advance into the polar region and the natives to contact the outside. Traditional lifestyles have often given way to—or at the very least adapted to—modern technology. Many of the languages are threatened.

At present there are an estimated four million people living in the Arctic Circle region, and approximately one million are part of the circumpolar peoples. The indigenous peoples of the Arctic Circle region include the Lapps of

THE LOSS OF LANGUAGE DIVERSITY

Threatened languages are not only a feature of the Arctic landscape but are also a global issue. According to UNESCO statistics, 230 languages have become extinct since 1950, and half of the world's 6,700 languages are likely to disappear by the end of the twenty-first century. Three thousand or more are considered endangered as of 2009. To mention a few of the endangered, 143 languages are threatened in China, including Patua, Green Gelao, and Bonan. India has 196 endangered languages, including Naiki, Koraga, and Bangani. The 13 endangered languages in Algeria include Tidikelt and Zenatiya. Germany has 13 endangered languages, including Saterlandic. Yiddish is also an endangered language throughout Western and Eastern Europe. In Britain, 11 languages are endangered including Manx, Scottish Gaelic, and Irish; in the United States, the approximately 192 endangered languages include Hawaiian, Mandan, Sauk-Fox, and Potawatomi. At the same time as these languages are declining, according to statistics listed in *Worldwatch Vital Signs 2006–07*, Mandarin Chinese has become the world's most widespread language, with about three times the speakers of its nearest rivals, Spanish and English. Filling out the world's top ten languages are Standard Arabic, Hindi, Portuguese, Bengali, Russian, Japanese, and German.

—Fred Nadis

Scandinavia (Sami); the Samoyeds (Nentsy) of western Russia; the Nganasans, Yakuts, Tungus, Yukaghirs, and Chukchis of eastern Russia; and the Eskimos (Inuit) of North America. Besides the peoples just named, there is a considerable ethnic Russian population in Siberia, an ethnic mixture of European and Inuit in Greenland, and mostly European-descended peoples in Iceland.

The Saams (Sami) of Scandinavia (who consider the term "Lapp" derogatory) live along the Arctic reaches of Northern Europe. There are several groups that all speak a variant of *saam'kill*. However, due to geographical isolation and contemporary political boundaries, the versions of Sami spoken in Norway, Sweden, Finland, and Russia differ. Much of the income of the Sami living a traditional lifestyle comes from

herding reindeer along with fishing, hunting, and crafts. However, in recent decades due to population growth, restrictions in Swedish law on reindeer herding (Reindeer Husbandry Law of 1971), Sami emigration has become more prevalent. Arctic habitats on which the Sami depend for their livelihood have shrunk due to forestry, hydropower generation, mining, and other extraction industries. While Sami culture in the Russian Kola Peninsula region is fading, traditions and language have been preserved in Norway and Sweden, as books and other reading materials are printed in Sami. Nonetheless, Sami dialects are in danger of extinction. Their current population is estimated at around 55,000 people.

Samoyeds are the Nenets indigenous people of Russia. They are spread across the Yamalo-Nenets Autonomous Okrug (province) and the Nenets Autonomous Okrug. Their population in 2002 was estimated to be 41,300 in Yamalo-Nenets and 7,750 in Nenets Okrug. While they have historically been hunters and fishers, the expansion of oil extraction industries in the Arctic region has brought large numbers of ethnic Russians and other groups into Nenets traditional territory so that they are now only a small part of the total population. Only about half the Nenets who are either Tundra Nenets or Forest Nenets are native speakers. Under Soviet rule there were sternly applied programs that sought to collectivize the indigenous peoples. The programs usually damaged their traditional cultural practices and economic base. The Nganasans, living on the Taymyr Peninsula, are a Samoyedic people who were living in isolation until recent decades. While historically they were nomadic hunters, fishers, and herders of reindeer, under Soviet rule their Shamanic religious practices were severely suppressed. There are now an estimated 1,000 Nganasans living among Russians and others. The Yakuts, who call themselves Sakha, speak a Turkic language. They number around 400,000 speakers, with some living in the Arctic region of central Siberia. The migration of Russians into the region to exploit its natural resources has also strained traditional lifestyles. The Tungus are a Tungusic-speaking people of Siberia and Manchuria. The Manchu, who con-

quered China and ruled as its last dynasty (Qing), have been absorbed into the Han Chinese. However, those who stayed in Siberia have also nearly disappeared as an ethnic and linguistic group. Numbering approximately 30,000, they live along the Yenisei, Ob, and Amur River basins (Evenki) and along the Okhotsk Sea coast. Yukaghirs live in eastern Siberia in the Kolyma River basin. Their numbers declined radically after the 1700s. The 2002 Russian census listed them as numbering 1,500, which was an increase from 1,100 in the previous census. Most of them are now bilingual, speaking both Russian and their indigenous Yakut. Chukchis are indigenous people speaking Chukchi, which is an old form of Paleo-Siberian. Their numbers are about 15,700, but only about half of them speak Chukchi. The language is in decline and is listed as critically endangered in the UNESCO Red Book of Endangered Languages of 2009.

The Eskimos are the most populous group of indigenous people in the Arctic. They are spread across the Arctic from eastern Siberia to Greenland. There are three main groups: Yupik, Inuit, and Aleut. These are related by language and culture. At present, many of the Inuit consider the term “Eskimo” to be derogatory, while scholars have continued to use it. It is still generally used in Alaska. The Aleut are people who migrated and settled in the Aleutian Islands and other nearby island groups; their language is nearly extinct. The development of military installations, mining, oil exploration, and other industries supplied by ice road truckers have instituted changes in traditional cultures. In Alaska, the Eskimos have benefited from the oil profits paid to Alaska and from the many jobs that the oil industry has created. However, at the same time climate changes have reduced their game and fish resources. Modernity threatens to end the traditional knowledge used by earlier generations to survive in the Arctic.

In Canada, the Inuit have been able to organize their Arctic territory into the newest federal territory of Canada. Nunavut Land (“our land” in Inuktitut) was organized in 1999 as a separate territory from the North West Territories. Nunavut was the first change to the map of Canada since Newfoundland became a province in 1949.

Baffin Island is the center of the new province. The capital of Iqaluit was previously called Frobisher Bay. Geographically it is the largest political unit in Canada, covering an area about the size of Mexico, but it is the least populated. During the Cold War, a number of Inuit were forcibly relocated to accommodate Canada's program of national security. Compensation was paid decades later.

■ Introduction: The United States in the World

There is an ongoing debate among academics, journalists, and politicians about whether the United States should be regarded as an empire and whether this is on balance a positive or negative development for the United States and international society. This debate has been fueled by the U.S. diplomatic and military response to the terrorist attacks in New York on September 11, 2001. Uncertainty about the imperial credentials of the United States can be explained by the fact that there is no commonly accepted definition of empire. Some academics interpret empire as formal rule over foreign territories, while others allow for a looser form of control, or hegemony, expressed through political, military, economic, and cultural influence. These arguments can be evaluated partly in relation to the territorial evolution of the United States during the nineteenth century. It is essential that this historical context is not lost in the often contentious discussions of contemporary U.S. foreign policy. Comparisons and contrasts between the present-day United States and previous empires, especially the British empire, also provide a useful means to analyze some of the features of the debate about U.S. imperialism.

The United States became a sovereign state as a result of a rebellion against British imperial rule, and thereafter U.S. political rhetoric continued to stress hostility to European imperialism. Nevertheless, during the nineteenth century the United States evolved through a series of territorial annexations that could be described as imperialist. Some aspects of this were peaceful, such as the purchase of Louisiana Territory from France in 1803 and Alaska from Russia in 1867. Yet the United States also occupied large swaths of territory as a result of conquest. The ethnic cleansing of Native Americans demonstrated the bellicosity of U.S. expansion, as did wars against foreign powers. Annexation of Texas in 1845 sparked a war with Mexico that resulted in the acquisition of California and New Mexico in 1848. A short war with Spain in 1898 brought the United States control of the Philippines, Guam, and Puerto Rico and prompted the annexation of Hawaii. These developments were highly significant because the United States governed foreign, noncontiguous territories in a similar fashion to the European imperial powers.

It may be denied that the United States is an empire today because it does not exercise

extensive formal control over territories and peoples beyond its own borders. At its zenith following World War I, the British empire occupied more than 13 million square miles, or almost one quarter of Earth's surface, and governed a similar proportion of the world's population. Today, the United States and its formal dependencies in the Pacific and Caribbean account for only about 6.5 percent of Earth's surface and 5 percent of the world's population. On the other hand, these figures do not acknowledge the significance of informal imperialism—characterized by economic presence rather than territorial rule—through which imperial powers have gained considerable economic benefit and exercised tremendous political influence. Relative to Britain in the nineteenth century, the United States today enjoys far higher rates of economic growth, and its multinational corporations dominate the global economy to a far greater extent than British companies did. U.S. hegemony in the contemporary world system is also expressed through its influence in institutions such as the World Trade Organization and the General Agreement on Tariffs and Trade. Lack of formal territorial control beyond the continental United States thus may not demonstrate conclusively that the United States is not an imperial power.

The power to project military force in defense of political and economic interests that are far removed from the imperial heartland has been characteristic of empires since ancient times. During the period following the September 11, 2001, attacks the United States articulated a doctrine that dictated that its armed forces must be capable of fighting two wars anywhere in the world simultaneously, such as the early-twenty-first-century wars in Afghanistan and Iraq. This doctrine has been underwritten by a U.S. defense budget that by 2007 was greater than those of the next 15 industrialized countries combined, or 40 percent of what the rest of the world was spending on defense. Technologically, the U.S. armed forces are in a class of their own on land, at sea, and in the air. The United States can act independently of regional alliances such as the North Atlantic Treaty Organization, and there can be no doubt that the present-day United States possesses the military capabilities of an imperial power.

Many writers of different political persuasions have agreed that the United States today is an empire, but their attitudes to this have varied between condemnation and endorsement. Critics on the left of the political spectrum, including writers such as William Blum, Noam Chomsky, and Chalmers Johnson, have emphasized the injustice of U.S. imperialism and argue that it explains global hatred of the United States. Critics on the right of the political spectrum, notably Patrick Buchanan, have stressed the economic cost to the United States of its imperial role and the betrayal of its isolationist heritage. Yet there are also many conservative commentators, including Max Boot, Niall Ferguson, Dinesh d'Souza, and Robert D. Kaplan, who favor an imperial role for the United States. They have stressed the positive benefits of U.S. imperialism, such as the global integration of markets, propagation of democracy, and improved security.

This debate about the existence, character, and effects of U.S. imperialism will no doubt continue to be conditioned by the U.S. response to a variety of international issues including economic development, climate change, human rights, nuclear proliferation, and terrorism.

United States Foreign Policy, 1945–1962

The United States and the Soviet Union maintained an uneasy alliance during World War II. Even before the war ended there were American military officers and government officials who

spoke openly of a potential conflict between the two allies. Most Americans and the U.S. government remained guardedly optimistic about a peaceful postwar world built upon mutual cooperation. Following the surrender of the Axis powers in 1945, the United States demobilized considerable portions of its military forces and began to work through the United Nations (UN) as a forum to advance its aims and resolve disputes. Nonetheless, the United States continued to construct atomic bombs and maintain overseas bases.

Disagreements continued between the United States and the Soviet Union over joint occupation of Germany and the fate of Berlin, over the meaning of wartime agreements at Tehran and Yalta, and over Soviet support of communist movements in Western Europe. While experts at the time and even now argue whether the Soviet Union was truly expansionist or simply concerned with establishing security, consensus developed in the United States that the Soviet Union had to be forcefully confronted. U.S. State Department Soviet expert George F. Kennan was the chief architect of the new policy, which came to be known as containment. In a February 1946 telegram from Moscow, Kennan argued that Soviet leaders, like past Russian leaders, were driven by an irrational paranoia of invasion. Kennan argued that a policy of patient long-term containment of Soviet aggression or expansion would eventually lead to the collapse of the Soviet Union without recourse to direct war.

Kennan's analysis was strengthened when, one week later, British prime minister Winston Churchill made his famous Iron Curtain speech at Westminster College in President Harry S. Truman's home state of Missouri, arguing that the Soviet Union's expansionist aims posed a grave threat to the interests of the United States and global peace. The new hard-line containment policy adopted by the Truman administration was built upon political, economic, and military foundations. In a March 1947 speech to Congress, Truman announced that the United States would offer support to any country in its fight against a domestic insurgent communist movement. Greece and Turkey received the first aid grants under this policy, which was dubbed the Truman Doctrine.

To stabilize the economy of Europe and weaken the communist movements in France and Italy, which prospered in hard postwar times, the United States provided \$13 billion in assistance. Known as the Marshall Plan, it was one of the most successful American foreign policy initiatives and also aided the expansion of U.S. business opportunities. The Marshall Plan operated on the assumption that Germany was the heart of the European economy and that a strong Germany was essential to an anti-Soviet Europe. This policy worked counter to the Soviet interests, as 30 years of war had convinced the Soviets that Germany must remain weak. Militarily, the Truman administration instituted a peacetime draft, continued construction of atomic bombs, reorganized the Defense Department, created the Central Intelligence Agency (CIA) as well as the National Security Council, and in 1949 negotiated the North Atlantic Treaty Organization (NATO) to contain the Soviet Union with an armed alliance in which an attack on one nation would be considered an attack on all. The United States also provided a sizable force permanently stationed in Europe.

In 1950 the National Security Council codified Cold War policy in a classified report known as NSC-68. Building on containment policy, NSC-68 also called for covert actions, aid to allies, maintenance of atomic weapons superiority, and military preparedness to undermine the Soviet Union. This framework would remain in place throughout the Cold War. Truman's policies were a complete break with traditional American policies of noninvolvement outside of the Western Hemisphere.

The Truman administration made long-term American commitments in other parts of the world as well. In 1948 he established the permanent American commitment to Israel when he recognized that new nation. His East Asian policy focused on reconstructing and rebuilding an economically strong but militarily weak Japan. Under the limitations of the postwar Japanese constitution, the United States became its military protector.

The Soviets immediately tested containment. In 1948 the Soviet Union blockaded West Berlin in response to American economic reforms in West Germany. The blockade lasted for more

than 300 days, but war was averted because the United States responded with a peaceful airlift of supplies. The blockade highlighted the symbolic importance of West Berlin as a free city in the heart of communist East Germany. In 1950 the United States, backed by a UN resolution, sent troops to Korea when communist North Korea invaded South Korea. After three years of fighting, the border between the two Koreas was established not far from its original line. Although Truman succeeded in containing communism and keeping the war limited to Korea, it was very unpopular at home. Not all efforts at containment were successful. In 1949 Mao Zedong led the communists to victory in China to conclude a decades-long civil war. This stunned Americans and fueled suspicion that a communist fifth-column movement inside the United States operated on behalf of the Soviet Union.

After his election in 1952, President Dwight D. Eisenhower modified containment policy. Referred to as the New Look, his policy sought to decrease the amount of spending on conventional forces and increase reliance on nuclear weapons. Eisenhower was convinced that the threat of massive nuclear retaliation could contain communist expansion while, at the same time, lessening the military's demand on the economy. He wanted to balance the federal budget and keep interest rates low in order to demonstrate that the American economy provided greater opportunity to the average citizen than the communist system.

Eisenhower's policy of massive retaliation contributed to the stalemate in the Korean War conflict in 1953 and helped block threatened Chinese invasions of the islands of Quemoy and Matsu in the Straits of Formosa in 1955 and 1958. Massive retaliation was less successful in Europe. The United States did not actively aid anti-communist forces in Hungary during the 1956 uprising that led to the Soviet occupation of that country and the execution of the uprising's leaders. Instead of atomic weapons, the Eisenhower administration turned to the CIA and covert actions. At Eisenhower's order, the CIA ousted the leaders of Iran (1953) and Guatemala (1954).

Eisenhower supported French withdrawal from Indochina and the division of Vietnam into two halves based on the Korean model. To pro-

tect pro-U.S. South Vietnam from the communist North Vietnam, the United States negotiated the South East Asia Treaty Organization (SEATO). The Eisenhower administration began the slow, steady process of increasing American involvement in Vietnam when he sent in U.S. military advisers.

When Eisenhower left office in 1961, there was growing fear that the Soviet Union had outmaneuvered the United States in the developing world, while the successes of the Soviet space launches suggested the Soviet Union had surpassed the United States in science and technology. In response, President John F. Kennedy implemented an increase in military spending while also seeking to put a softer face on American foreign policy by establishing the Alliance for Progress and the Peace Corps, which spread American knowledge and some financial aid to Latin America and other developing countries. To counteract public concerns about a so-called science gap, or technological inferiority, Kennedy challenged America to put a man on the moon by the end of the decade.

Although a committed adherent of containment, Kennedy relied on a policy called flexible response, which soon would encourage an increasing involvement in Vietnam. Outlined by former U.S. Army chief of staff General Maxwell Taylor, flexible response focused on soft power, conventional forces, and counterinsurgency methods, such as the Green Berets, and less on the threat of employing nuclear weapons to contain communism.

The most immediate problem that Kennedy inherited was the new regime of Fidel Castro in Cuba. In April 1961 a botched CIA-backed invasion of Cuba at the Bay of Pigs, planned under Eisenhower, failed. Kennedy, the new president, was forced to apologize to his own nation. Two months later he met with Soviet leader Nikita Khrushchev in Vienna. This meeting only increased hostilities. Khrushchev had become concerned about the flow of East Germans to the West through Berlin. When Kennedy did not agree to Khrushchev's suggestion of an alliance that would place Berlin in the East German sphere, Khrushchev ordered the construction of the Berlin Wall. Berlin became tense throughout 1961 and 1962 as Soviet and American tanks

faced off at distances of only a few yards. In private, Kennedy was pleased at the construction of the wall, as the United States, tactically at the mercy of the Red Army, had little recourse beyond threats to use the atomic bomb in a military confrontation with the Soviet Union in Western Europe. Rhetorically, Kennedy remained firm on defending West Berlin as an island of freedom and significantly increased the defense budget.

The most dangerous moment of the Cold War occurred in the autumn of 1962. In an effort to achieve parity with the United States and its intermediate-range missiles trained on the Soviet Union, the Soviets quietly placed nuclear missiles on Cuba. Within weeks, the United States discovered these installations through U-2 spy plane surveillance. Having learned from the Bay of Pigs fiasco, Kennedy rejected any response that involved an American military attack on Cuba, but he did authorize a quarantine of Cuba to turn back Soviet ships that might be carrying missiles or warheads. After two very tense weeks of confrontation and behind-the-scenes diplomacy, the Soviets withdrew the missiles; later, the United States quietly withdrew medium-range missiles from Turkey.

United States Foreign Policy, 1962–1989

The Cold War years 1962 to 1989 served as a period of restrained confrontation in American foreign policy. Unlike the first part of the Cold War, this era is marked by a relative relaxation in tension, with the Cuban Missile Crisis in October 1962 marking a turning point. After nearing the brink of nuclear war, both the Soviet Union and

the United States took steps to improve relations. While nuclear arsenals and the number of nuclear countries grew, communication and trade between the superpowers expanded simultaneously. Beginning with the presidency of Richard M. Nixon and moving forward haltingly, a spirit of cooperation called *détente*, or peaceful co-existence, developed between the two Cold War adversaries. Although direct confrontations between the United States and the Soviet Union waned after 1962, U.S. commitment to contain communism in Asia and Latin America led to several highly controversial military and covert action campaigns in Vietnam and Central America.

In the early 1960s the U.S. commitment to containment led to a 16-year-long war in Vietnam whose origins and lessons are still being debated. After Vietnamese nationalist forces defeated French colonial forces, Vietnam was granted independence and divided at the 17th parallel in 1954. The northern half of the country was led by the procommunist nationalist Ho Chi Minh. Election plans to reunite the country were ignored by an American-funded South Vietnamese government. Dissatisfied with the South Vietnamese government, in late 1960 the National Liberation Front (NLF), an insurgency group, was established in the South. Also referred to as the Viet Cong, the NLF was a nationalist-communist coalition partially supported by Ho Chi Minh's communist North Vietnamese regime. The situation in South Vietnam destabilized in November 1963; in response, the John F. Kennedy administration tacitly approved a coup against the unpopular and brutal South Vietnamese leader Ngo Dinh Diem, who was subsequently kidnapped and executed while en route to exile. Over the next year and a half, the country's civil war escalated. In 1965 following the Gulf of Tonkin incident in which a radar operator on a U.S. destroyer reported two alleged torpedo attacks, U.S. president Lyndon B. Johnson authorized a sustained bombing campaign, Operation Rolling Thunder, over North Vietnam in addition to the bombing of suspected Viet Cong territory in the South and the deployment of American troops. By the end of the year, 200,000 Americans were fighting in Vietnam.

The war became unpopular, especially on college campuses, and caused large antiwar

► THE GULF OF TONKIN INCIDENT

On August 2, 1964, the U.S. Navy destroyer USS *Maddox* was attacked in the Gulf of Tonkin by North Vietnamese patrol boats. The attack was driven off, but two days later, the *Maddox*'s crew mistook radar returns from choppy waters for a second attack. The Lyndon Johnson administration responded by ordering the bombing of a number of North Vietnamese targets and sending a resolution for further action to Congress. Although the *Maddox* had been providing intelligence support for South Vietnamese military operations, Secretary of Defense Robert McNamara denied this in his testimony before Congress when the resolution was being debated, calling the two attacks “unprovoked.” This Gulf of Tonkin Resolution, as it came to be called, is historically significant because it was used as the legal basis for future U.S. involvement in the Vietnam War. Many historians would argue that its passage involved not simply a misconception on the part of Johnson’s administration but a deception.

The stated goal of the joint congressional resolution was “to promote the maintenance of international peace and security in southeast Asia.” Largely as a result of Secretary McNamara’s testimony, the resolution passed on August 7, 1964, with only two senators dissenting. The Tonkin Gulf Resolution stated that “Congress approves and supports the determination of the

President, as Commander in Chief, to take all necessary measures to repel any armed attack against the forces of the United States and to prevent further aggression.” Although the resolution became the subject of great political controversy as the war progressed, President Johnson and his successor President Richard Nixon used it as the legal basis for escalating U.S. military involvement in Vietnam. In reaction to growing public resistance to the Vietnam War, the resolution was repealed by Congress; the repeal was signed into law in January 1971. The resolution was later replaced by the War Powers Act of 1973, still in place today, that limits the power of the president to wage war without the approval of Congress.

demonstrations. By 1968 there were more than 500,000 U.S. troops battling NLF insurgents and the North Vietnamese Army. In January 1968, 85,000 communist forces launched the devastating Tet Offensive. Although the Tet Offensive was not a great military victory for the communists and may even have been a defeat, it was a psychological victory for the North Vietnamese and the NLF. Seeing televised footage of the U.S. embassy under attack in Saigon, the American public concluded that the war might never end in a lasting victory. The 1968 Tet Offensive and the shift in U.S. public opinion led to the opening of negotiations between the United States and North Vietnam.

After winning the presidential election in 1968, Nixon, who served from 1969 to 1974, followed a policy of Vietnamization, or removal of

American ground troops while providing greater economic aid, material assistance, and air support to South Vietnamese forces. Despite his reduction in American involvement, he briefly expanded the war with an illegal secret bombing campaign in Cambodia in 1970 to attack the communist supply routes known as the Ho Chi Minh Trail. In 1973 the United States and North Vietnam ended the war by a peace treaty, but it did not save the South, which fell two years later. In an effort to head off future Vietnams, Nixon also offered a serious shift in containment policy known as the Nixon Doctrine: nations receiving U.S. economic and military aid would have to supply their own ground troops.

Fragmentation and realignment of world power was also a crucial element of the latter half of the Cold War. The relationship between

the People's Republic of China (PRC) and the Soviet Union had steadily deteriorated after the death of Soviet leader Josef Stalin in 1953. The relationship completely cracked by September 1968 when Chinese leadership declared the Soviets as their primary threat. To gain strategic benefits from the rift and to aid efforts to end the war in Vietnam, President Nixon quietly pursued rapprochement with China during his first administration. This process was concealed from the public until October 1971 when National Security Adviser Henry Kissinger returned from his second trip to China with an invitation for Nixon to visit the following year. These dramatic events also corresponded with Taiwan's removal from the United Nations (UN) and the PRC's assumption of the UN Security Council seat. Despite these promising steps, relations between the United States and China were not normalized until 1979, when an American PRC embassy opened.

During this same period, Nixon and Kissinger, now secretary of state, pursued détente with the Soviet Union. The superpowers implemented détente through the Strategic Arms Limitations and Anti-Ballistic Missile Treaties of 1972, increased trade, and participated in summits between Nixon and Soviet leader Leonid Brezhnev. Despite these moves to bring some stability to the volatile global political system, there was a brief moment in 1973 when war seemed possible between the two superpowers because of Soviet support of Egypt in its war with Israel. Détente reached its greatest expression with the Helsinki Accords of 1975. In signing the accords, the United States recognized and accepted as legitimate the post-World War II borders and governments, including the communist regimes in Eastern Europe that were propped up by the Red Army.

Détente, however, had its limits. The United States had no toleration for leftist regimes in Latin America that could threaten the economic status quo. As an alternative, the United States turned to covert actions and the backing of military strongmen with strong anticommunist credentials but no commitment to democracy or civil rights. In 1973 with some support from the U.S. Central Intelligence Agency, a coup deposed leftist president Salvador Allende, and Augusto Pinochet seized power.

U.S. president Jimmy Carter's administration (1977–1981) saw the emergence of the Middle East as a critical theater of American foreign policy. Since the end of World War II the American Middle East policy was focused on support of Israel and keeping the vital oil supply lines open. Carter promoted peace in the region and made significant progress with the Camp David Accords in which Egypt became the first Arab nation to formally recognize Israel. However, decades of American support for Israel and for Shah Mohammed Reza Pahlavi in Iran had significant consequences in 1979. After Islamic revolutionaries overthrew the shah's government, they took 50 hostages from the American embassy in Tehran and held them for more than 400 days. The Iranian Revolution and an anti-Soviet insurgency in Afghanistan spread a growing Islamic fundamentalist movement in the region that was radical, violent, and vehemently anti-American.

In addition, in 1979 the Soviet Union sent troops into Afghanistan to prop up an unsteady local communist regime. Carter reacted by suspending trade, boycotting the 1980 Summer Olympics in Moscow, and withdrawing the second Strategic Arms Limitation Treaty from the Senate. The United States also covertly aided anti-Soviet Afghani freedom fighters. The spirit of détente was over. Carter began to increase his anti-Soviet rhetoric and bolster the military. He also announced the Carter Doctrine, which insisted that the United States had the right to intervene militarily in the Middle East and the Persian Gulf if its interests were threatened.

Amid deteriorating relations with the Soviet Union, U.S. president Ronald Reagan (1981–1989) aggressively escalated Cold War rhetoric to pre-1962 levels. In 1983 he crystallized his policy when he referred to the Soviet Union as the Evil Empire. He significantly increased military spending, deployed nuclear missiles to Europe, and backed anticommunist movements in Nicaragua and Afghanistan. His support of the anticommunist Contras who were attempting to overthrow the leftist Sandinista government in Nicaragua led his administration to break the law with a complicated exchange of arms to Iran for hostages in Lebanon in which the profits on the illegal arms sales as well as money from private sources were channeled to the Contras. This breach of U.S.

law, which was dubbed Contragate by the press and which led to the indictment or conviction of 190 officials in the Reagan administration, was the most serious presidential scandal since Watergate.

A critic of détente, Reagan positioned the Cold War as a moral crusade requiring fortitude in the face of challenge. In 1983 he deployed U.S. Marines to Beirut to stabilize Lebanon and ordered the battleship USS *New Jersey* to fire support missions. A car bomb that killed 241 marines in their barracks led Reagan to withdraw the troops. Two days after the car bombing, on October 25, 1983, the United States invaded the small and strategically insignificant Caribbean island of Grenada to overthrow a leftist regime supported by Cuba. Referring to a popular movie of the time, *First Blood* (1982), that introduced Sylvester Stallone as the volatile character John Rambo, the press began to call Reagan “Ronbo.” In April 1986 Reagan also ordered an attack on Libya after its leader, Muammar Qaddafi, was accused of supporting a terrorist attack in Berlin.

During the early years of Reagan’s administration, the Soviets had a succession of elderly and feeble premiers. It was only in 1985 with the emergence of reformer Mikhail Gorbachev that Reagan found a partner with whom to negotiate. In November 1985 the two leaders met for the first time at Geneva and established a rapport. The following year they met at Reykjavik, Iceland. Gorbachev made a significant proposal for arms reduction if the United States would give up on Reagan’s costly Strategic Defense Initiative (SDI), a satellite-based missile defense system dubbed Star Wars by the press, but Reagan refused. In December 1987 Gorbachev and Reagan signed the Intermediate-Range Nuclear Forces (INF) Treaty, which eliminated all U.S. and Soviet INF missiles.

The following year, the Soviets agreed to a UN-mediated accord regarding Afghanistan. The change in Soviet attitude also extended to Eastern Europe. Gorbachev informed leaders of the Soviet Eastern Bloc that he would not use troops to prevent their independence from the Soviet Union. Germany tore down the 28-mile Berlin Wall on November 9, 1989. Other countries such as Lithuania declared their independence from the Soviet Union in March 1990. By the conclu-

sion of 1991, the Soviet Union was dissolved and the Cold War ended.

United States Foreign Policy, 1989–Present

Even prior to the collapse of the Soviet Union, U.S. strategic interests had begun to shift away from U.S.-Soviet power relations. While the United States contributed to United Nations (UN) peacekeeping missions around the globe and negotiated the economic realities of globalization, increasingly since 1979 its primary focus had been protecting American interests in the Middle East, as clearly shown by the Gulf War and the Iraq War in this period. The collapse of the Soviet Union and the achievements of the U.S.-led coalition during the Gulf War marked the beginning of what U.S. president George H. W. Bush (1989–1993) termed the New World Order in which the United States, as sole military superpower, either unilaterally or multilaterally would monitor the world and encourage the “growing zone of democratic peace.” Yet the legacy of the Vietnam War and the risk involved in attempts at nation building also tempered U.S. foreign policy. The Bill Clinton administration (1993–2001) in particular insisted that the United States needed to choose its interventions more selectively and focus on economic globalization and domestic prosperity. Subsequent administrations as well as the challenge of global terrorism continue to reshape the contours of

the New World Order and the U.S. role on the world stage.

By the 1990s, Iraq had replaced Iran as United States' main Middle East concern. To alleviate financial problems caused by the Iran-Iraq War of the 1980s, on August 2, 1990, Iraq invaded its oil-rich neighbor Kuwait. After a brief effort at imposing economic sanctions, the UN passed a resolution on November 29, 1990, threatening force by a 31-country coalition army if Iraq did not leave Kuwait. Iraq ignored this ultimatum, and the Gulf War (code name Desert Storm), involving a multinational coalition headed by the United States, began on January 16, 1991. The high-tech show of U.S. force, orchestrated on global television, made clear that the United States was now the world's sole military superpower. Accordingly, the triumphant George H. W. Bush administration began to formulate a vision for a New World Order. A leaked document to the *New York Times* in 1992, authored by the Defense Department's Zalmay Khalilzad and titled "Defense Planning Guidance, 1994–1999," would privilege U.S. "global leadership" over a "collective security" or multilateral approach to resolving international conflicts; the document also focused on how to nurture alliances to prevent the emergence of new superpowers or of nuclear proliferation that might create spheres of influence and lead to a multipolar world. A revised Pentagon document leaked in 1992 indicated a more multilateral approach but urged a military buildup so intense that the U.S. power could never be seriously challenged. Such an approach would do away with any future balance of power scenarios such as that of the Cold War. Yet the most immediate challenge for the United States appeared not from the power of nation-states but instead of globalizing terrorist networks.

By the end of the 1990s al-Qaeda, led by Saudi Osama bin Laden, a former Afghani freedom fighter, emerged as the world's leading terrorist group. The Gulf War was a turning point for bin Laden. During the war his proposal for a jihad against Saddam Hussein was turned down by the Saudi government, and he grew to resent the American military presence and influence in Saudi Arabia. By 1998 bin Laden had founded the anti-American extremist Muslim terrorist

group al-Qaeda. Al-Qaeda headquarters were in Afghanistan, which since 1996 was ruled by the Taliban, a militant student group. In 1998 bin Laden issued a fatwa calling on all Muslims to kill Americans as their religious duty. This mission was carried out around the world. For example, al-Qaeda had attacked an American military barracks in Dhahran in 1996 and the U.S. embassies in Kenya and Tanzania in 1998.

Al-Qaeda's most devastating attacks occurred on September 11, 2001. On that day, 19 al-Qaeda terrorists hijacked four U.S. commercial airplanes and flew them into the twin towers of the World Trade Center in New York City and the Pentagon outside Washington, D.C. The fourth plane crashed in Pennsylvania before reaching its target. More than 3,500 people were killed in less than two hours. In response, President George W. Bush declared a "war on terrorism." He stated, "If you harbor terrorists, you're a terrorist; if you aid and abet terrorists, you're a terrorist—and you will be treated as one." This doctrine was put into practice approximately one month later in Afghanistan. In October 2001 the United States, along with Britain and later other North Atlantic Treaty Organization (NATO) nations, began military operations in Afghanistan. By December the Taliban fled the capital, leaving the country to warlords. However, as of 2009, American forces remain in Afghanistan searching for al-Qaeda members and bin Laden.

The United States, which under the Clinton administration had limited itself to bombing raids in the Iraqi no-fly zones—set up to protect Kurdish populations in the North and Shia populations in the South—returned to Iraq in full force in 2003. The George W. Bush administration claimed that Iraq was violating UN inspection agreements and in fact possessed weapons of mass destruction. In February and March 2003 the UN rejected American resolutions authorizing force. Despite this failure, on March 19, the United States and its allies began Operation Iraqi Freedom, an invasion of Iraq designed to depose Hussein. On April 9 the allied forces took control of Baghdad, and on May 1 Bush declared the end of major combat operations. By the end of 2005, Operation Iraqi Freedom and the ensuing guerrilla war had cost the United States 2,100 service personnel and more than \$200 billion,

while violent factional fighting in Iraq escalated into an unofficial civil war.

While the U.S. foreign policy since the Cold War has focused primarily on the Middle East, America also cautiously awaited developments in the former Soviet sphere. The administration of President George H. W. Bush assisted in the negotiations to reunify Germany in 1990 to ensure that the new nation would be a member of NATO and the European Community (EC). While his administration also encouraged the transition of former Soviet satellites into democracies, the United States offered only modest economic aid and instead left such aid and planning to the EC. The nonaligned Yugoslavia, however, began to violently disintegrate alongside the Soviet Union. The main impetus came when Slobodan Milosevic, the president of the Serbian republic within Yugoslavia, abandoned communism and embraced instead an ideology of Serbian nationalism. As various provinces, beginning with Slovenia and Croatia, declared their independence, civil wars between contending ethnic groups in various provinces developed.

The ensuing struggle between Yugoslavian Serbs and the Muslim majority in Bosnia demanding independence led President Clinton to host the 1995 Dayton Accords, which called for a cease-fire and the lifting of the Serbian siege of Sarajevo in Bosnia. After the Dayton Accords, the United States also participated in a controversial and at times ineffective NATO peacekeeping mission in Bosnia to prevent ethnic cleansing and other abuses. In the spring of 1999 the United States and its NATO allies also bombed Serbia to force Milosevic to halt the ethnic cleansing of ethnic Albanians and remove Serb forces from the province of Kosovo. With Russian encouragement, Milosevic finally relented on June 10, 1999.

As in the Bosnian mission, American peacekeeping efforts in Somalia (1992–1993) and Haiti (1994–1996) were extremely unpopular in the United States. Mass starvation and public pressure had encouraged President George H. W. Bush to send American troops into Somalia to aid a beleaguered UN peacekeeping mission; President Clinton removed these forces the following year after 18 U.S. Army rangers were killed and their mutilated corpses dragged through the

streets of Mogadishu. The UN peacekeeping mission soon collapsed. This disaster contributed to America's decisions not to send in troops to stop the Rwandan genocide in 1994.

Clinton directives suggested that the United States become more selective in military and peacekeeping missions and instead emphasize globalization and economic prosperity. His presidency reflected a public mood of relief over the end of the Cold War and the possibility of stepping down the national security state. Highlighting this emphasis, his administration created a new institution, the National Economic Council (NEC), as a counterpart to the Cold War-originated National Security Council (NSC). In globalization, the administrations of both George H. W. Bush and Clinton saw an opportunity to increase prosperity worldwide, encourage free trade democratic institutions, and create coalitions that might eventually serve U.S. and global security needs. In 1987 the United States and Canada negotiated a Free Trade Agreement. This was extended to Mexico in 1993 when the U.S. Congress passed the North American Free Trade Association (NAFTA), creating a common market for Canada, Mexico, and the United States. Additionally, the Clinton administration helped negotiate the Uruguay Round of the General Agreement on Tariffs and Trade (GATT), and in 1999 the United States along with 159 other nations joined the World Trade Organization (WTO), a group further committed to lowering trade barriers and mediating commercial disputes.

During this period, the United States also normalized trade relations with former Cold War enemies. The United States established full diplomatic relations with Vietnam one year after lifting the 19-year trade embargo in 1994. Although following the massacre at Tiananmen Square (1989) there was much debate in the United States about furthering the trade relationship with the People's Republic of China (PRC), the United States granted the PRC permanent normal trade relations in 2000.

While the U.S. diplomatic relations with former Soviet satellites had improved, following the election of George W. Bush and the terrorist attacks of September 11, 2001, the older di-

plomatic ties with Europe and specifically with the new European Union had become strained. Disagreements included European leaders' preference for a multilateralist world, rejection of the necessity of the second military invasion of Iraq, Washington's cancellation of the Anti-Ballistic Missile (ABM) treaty with Russia, the uncertain future direction of NATO, the tacit U.S. rejection of the Kyoto Accords on global warming, and even the Bush administration's efforts to build soft power in the Middle East with proposals to fund education, media, and banking in the region.

■ Introduction: Soviet and Post-Soviet Politics

Soviet postwar foreign policy, designed to secure its borders from invaders and ensure warm-water ports for international commerce, followed historical Russian geopolitical ambitions vis-à-vis the Middle East, the Caucasus, Central Asia, the Far East, and Eastern Europe. From a Soviet perspective, any such expansion efforts were seen as a means of protecting itself from a future attack (given two German invasions through Poland and an international anti-Soviet allied intervention during the Russian Civil War). The United States regarded these same maneuvers as evidence of communist expansion, contributing to the emerging Cold War. While internal policies to promote socialist economic development and quell public dissent followed a Marxist-Leninist ideological framework, they also limited the production and distribution of consumer goods, as the state emphasized heavy industrial development and large-scale agricultural collective farms. From Josef Stalin to Mikhail Gorbachev, Soviet ideological, economic, and military support, and even outright intervention (as in Afghanistan) on behalf of socialist states, certainly played its role in the Cold War antagonism with the capitalist West. Regardless of attempts at rapprochement, the nuclear confrontation with both the U.S.-led West and communist China also positioned the Soviet Union in a precarious military position, which hindered its

economic and technological development and encouraged massive military spending.

With the collapse of the Eastern Bloc and the subsequent breakup of the Soviet Union in the late twentieth century, the Russian grip over much of its former dominions loosened somewhat. The post-Soviet Russian adoption of free-market capitalism and the sale of large-state industries (with its accompanying allegations that the Russian state was a kleptocracy) led to the creation of giant industrial concerns, many of which have had a stake in the current regime's foreign policy. Under the leadership of Vladimir Putin, in the early twenty-first century Russia reasserted its geopolitical hegemony in the Caucasus and Central Asia, much to the detriment of its increasingly hostile relations with Georgia and Ukraine. Moreover, Russia's concerns over the near-abroad ethnic Russian populations, control over Central Asia oil and gas reserves, the expansion of the North Atlantic Treaty Organization (NATO) in Eastern Europe and possibly beyond, and the United States' use of Central Asian military bases for its global War on Terror have served as reasons for Russia to maintain its hegemony in the region. More recently, Russian natural gas and oil distribution to various states of the European Union has expanded, leading to apprehensions that this energy dependency will leave much of Europe vulnerable to Russian

SOVIET TERRITORIAL GAINS, 1946

geopolitical ambitions. The 2008 episode during which Russia cut off the Ukraine's energy supplies indicates that these worries have grounds.

The Stalin Era

Josef Stalin (1879–1953) was a Russian revolutionary and dictator of the Soviet Union (1929–1953). More absolute a ruler than any Russian tsar, Stalin (born Iosif Vissarionovich Dzhugashvili) was one of the most powerful and influential figures in history and certainly one of its most horrific. As many as 20 million people may have died as a direct result of his policies.

In 1901 Dzhugashvili joined the Russian Social Democratic Labor Party. One of his aliases, the one by which he became best known, was that of Stalin (Man of Steel), given to him by his fellow revolutionaries for his strength and ruthlessness. Coarse and ill-mannered, Stalin was six times arrested and exiled and escaped five times. Freed during the March 1917 Revolution, he returned to Petrograd and became editor of the party newspaper, *Pravda* (Truth). His role in the Bolshevik seizure of power that November is unclear, but he did not take a leading part. Leon Trotsky, a rival for power later, remembered Stalin's role as "a grey blur." Stalin was active in the Russian Civil War (1918–1921) and the Russo-Polish War (1920–1921), and from 1920 to 1923 he was commissar of nationalities. In 1923 he assumed the post of secretary general of the Communist Party of the Soviet Union (CPSU), a position that he used as a springboard to power.

His political rise has been ascribed to his skill at infighting and playing one faction against another as well as his absolute ruthlessness, but he also put in long hours at his job and deserves considerable credit for his achievement. By the late 1920s Stalin had triumphed over his rivals, chief among them Trotsky, to wield absolute power in the Soviet Union. Stalin created the bureaucratic system and refined both the secret police and slave labor camps begun under his predecessor, Vladimir Lenin. Stalin abandoned Lenin's New Economic Policy (NEP), which permitted a degree of capitalism in Russia, and initiated a series of five-year plans to modernize the economy, concentrating on heavy industry.

➤ LAVRENTI PAVLOVICH BERIA

Born March 29, 1899, in Merkheuli, Georgia, Lavrenti Pavlovich Beria, a member of the Bolshevik Party from 1917, achieved notoriety as chief of the secret police agency, the NKVD (People's Commissariat for Internal Affairs), during the Stalin era. Heading the NKVD from November 1938, Beria presided over the conclusion (1938–1939) of the Great Terror; oversaw mass deportations that followed Soviet occupations of eastern Poland and the Baltic states (1939–1941); arranged the Katyn Forest massacre of Polish military officers (1940); organized the resettlement of Chechens, Tatars, and Volga Germans to Central Asia (1944); and guided the Soviet atomic bomb program in its initial stage (1944). Resigning from the NKVD in January 1946, Beria remained a powerful figure in the Soviet ruling elite and, at Stalin's death in March 1953, joined a collective leadership that included Nikita Khrushchev. Arrested and accused of conspiring to seize power in June 1953, Beria was executed in December 1953. He remains a personification of the political repression of the Stalin era.

—*Bruce DeHart*

Stalin's economic policies included the forced collectivization of agriculture that claimed an estimated 10–15 million lives. He was personally responsible for the Great Purge trials of the 1930s that consumed virtually all of the top party leadership. Also falling victim to the Great Purge were military leaders, including 60 percent of Red Army officers above the rank of major.

In foreign affairs, Stalin seized opportunities that presented themselves in Eastern Europe and the Balkans. Knowing exactly what he wanted, he met with Western leaders in Moscow and at the Tehran, Yalta, and Potsdam conferences. In 1919 after World War I, the West had quarantined the new communist Russia with a series of new successor states, endeavoring to contain communism with a cordon sanitaire. Following World War II, Stalin sought the reverse, insisting at the very least on governments friendly to the Soviet Union in order to provide security for a badly wounded Soviet empire.

Although there were fears in the West that Stalin's plans included the communization of Western Europe, the dictator's immediate motivation was simply that of securing the Soviet empire. Because of the Red Army presence on the ground, there was little that Western leaders could do to prevent this sort of war with the Soviet Union, which despite the U.S. nuclear monopoly was unimaginable to Washington in 1945. Stalin's regime emerged from the war with all of Eastern Europe and much of Central Europe under its control. The Soviet Union had suffered grievously during the war, with perhaps 27 million people dead and widespread physical destruction. In a new five-year plan, Stalin continued his emphasis on building heavy industry, although some attention was paid to pressing housing needs.

To unite the Soviet people under his leadership, Stalin proclaimed the belief of a communist world threatened by encircling enemies. Andrei Zhdanov, political boss of Leningrad, became the guiding spirit of this ideology, known as Zhdanovshchina. It championed Russian nationalism and attacked Western influence (now known as bourgeois cosmopolitanism), glorified communism, and above all trumpeted the accomplishments and inspiration of the Great Leader Stalin, attributing to him all Soviet successes.

Once Stalin rejected a closer relationship with the West, the Cold War was launched in earnest. Stalin refused to allow the East European Soviet satellites to participate in the European Recovery Program (Marshall Plan) and following an impasse over German reunification on Soviet terms and impending Western currency reform in the Allies' zones of Germany, in the summer of 1948 Soviet troops cut off Western land access to the city of Berlin. This sparked a major East-West confrontation and led to the Berlin Airlift. Stalin's tactics and saber rattling resulted in the 1949 formation of the North Atlantic Treaty Organization (NATO) and prompted the movement toward West European unity.

Stalin pushed hard to develop an atomic bomb, a process greatly accelerated by Soviet espionage. Following the explosion of the Soviet Union's first nuclear device in late 1949, he adopted a less militant foreign policy, jettisoning the militant expansionism of the immediate post-

war years in favor of one that was comparatively defensive in nature. While maintaining the traditionally truculent Soviet tone, he abandoned the further extension of his European empire. This move was accompanied by a massive propaganda effort, the great Stalinist Peace Campaign. Agitation against colonialism was increasingly used to weaken the Western hold on global military bases, while Soviet foreign policy also sought to sow discord between the United States and its allies.

Early in 1950 Stalin gave his blessing to plans by Democratic People's Republic of Korea (DPRK, North Korea) leader Kim Il Sung to invade the Republic of Korea (ROK, South Korea) and reunify the peninsula under communist rule. Stalin evidently believed Kim's contention that the United States would either do nothing or would not react in time to save South Korea. Later, when the war went badly for Kim and North Korea, Stalin sanctioned military intervention by the People's Republic of China (PRC), promising to provide the PRC with Soviet air cover.

Stalin's death in Moscow on March 5, 1953, following a paralytic stroke came as a relief to many in highly vulnerable Soviet leadership positions. His eventual successor, Nikita Khrushchev, began the slow process of de-Stalinization and denounced the many excesses of the Red Tsar.

Khrushchev Era, 1953–1964

Named for Nikita Khrushchev, Soviet Communist Party first secretary (March 1953 to October 1964), the Khrushchev era marked a turning point in the history of the Soviet Union. Characterized by official de-Stalinization, the era witnessed Khrushchev's pursuit of reform and relative liberalization at home and peaceful co-

existence with the West, in stark contrast to Stalin's policies of internal repression and confrontation with the West.

The watershed event of the era was Khrushchev's so-called secret speech. Delivered February 20, 1956, to a closed session of the Twentieth Congress of the Soviet Communist Party, the speech revealed crimes committed by Stalin between 1934 and 1953. Targeting the "cult of personality," which Khrushchev described as a violation of the "Leninist principle of socialist democracy," the speech condemned the persecution of innocent communists during the 1930s, Stalin's refusal to heed warnings of the 1941 German invasion, his military mistakes in 1941 and 1942, his deportations of national minorities, his postwar distortion of history, and his role in the 1948–1949 Leningrad Affair. Although Khrushchev failed to address catastrophes associated with the collectivization of agriculture or the repression of noncommunist Soviet citizens, the speech stunned the audience and initiated a gradual and official de-Stalinization that would ultimately, in 1961, see the removal of Stalin's body from Moscow's Lenin Mausoleum and Leningrad being renamed Volgograd.

Beyond raising serious questions about Stalin's legacy and attacking the cult of personality, Khrushchev sponsored important domestic changes, including a retreat from political terror and the simultaneous rehabilitation of Stalin's victims and their release—in the case of those still alive—from the labor camps. Khrushchev also promoted a shift in economic priorities to production of consumer goods and housing and a cultural thaw. Consequently, Soviet citizens felt a greater sense of personal security and enjoyed a higher standard of living, while Soviet intellectuals experienced a freedom of expression unfamiliar since the New Economic Policy (NEP) era of the 1920s. Greater intellectual freedom was epitomized by remarkable publications such as Yevgeni Yevtushenko's *Babi Yar* (1961) and Alexander Solzhenitsyn's *One Day in the Life of Ivan Denisovich* (1962). Khrushchev even proposed a division of the Communist Party into industrial and agricultural sections, a reform, had it been implemented, that would have laid the foundations for a pluralistic political system.

➤ KHRUSHCHEV'S "HAREBRAINED SCHEMES"

First Secretary of the Communist Party of the Soviet Union Nikita Khrushchev's ouster from power in 1964 was a result of accusations by the Politburo that he had conducted "harebrained schemes." Khrushchev's policy of de-Stalinization and his handling of the Cuban Missile Crisis had alienated many of the hard-liners of the Politburo. However, his Virgin Lands Policy was deemed as a major disaster for the first secretary. The Virgin Lands Policy, beginning in 1954, opened vast tracts of land in the southern Russian Soviet Federated Socialist Republic (RSFSR) and northern Kazakhstan for grain cultivation as part of an effort to boost agricultural production and economic expansion. However, after a decade the soil was exhausted due to single-crop cultivation practices, eventually leading to massive soil erosion in Central Asia. Furthermore, Khrushchev's tense relationship with communist leader of China, Mao Zedong, also contributed to his growing unpopularity. Mao was seen as a leading figure by many members of the Politburo, in essence a pivotal individual in leading the Third World revolution. By alienating Mao, the Soviet Union was branded as revisionist by China and thus lost much credibility as the leader of the Socialist world. For these reasons, Khrushchev was seen as a bumbler and was removed from power, replaced by the more conservative Leonid Brezhnev.

—Abraham O. Mendoza

In the realm of foreign policy, Khrushchev promoted "peaceful coexistence" and "alternative paths to socialism." The former challenged the Stalinist axiom that armed conflict between the communist and capitalist worlds was inevitable by asserting the possibility of peaceful competition, while the latter rejected the Stalinist maxim that the Soviet path was the only path to socialism by acknowledging more than one road to a classless society. Peaceful coexistence facilitated improved relations with the United States. Alternative paths to socialism helped Moscow achieve reconciliation with Josip Tito's Yugoslavia and allowed the communist leaderships in certain Soviet Eastern Bloc countries, Poland specifically, more leeway in their internal affairs.

Yet Khrushchev's new foreign policy concepts neither ended the Cold War—a fact epitomized by the Berlin Crisis of 1958–1961, the U-2 Incident of 1960, and the Cuban Missile Crisis of 1962—nor signaled a new era of freedom in Eastern Europe, this being made abundantly clear by Soviet military intervention in Hungary in 1956.

The Khrushchev era ended in October 1964 when Khrushchev's colleagues in the Soviet leadership, disillusioned with his “hare-brained schemes,” voted him from power and installed a conservative leadership headed by Leonid Brezhnev and Aleksei Kosygin that halted de-Stalinization. Retiring to Moscow, where he lived quietly until his death in 1971, Khrushchev became a forgotten man. Yet his efforts at de-Stalinization had gone so far that the Brezhnev-Kosygin leadership, despite neo-Stalinist proclivities, could not reestablish full-blown Stalinism. Interest in the Khrushchev era ultimately revived during the Gorbachev years (1985–1991) when many, both inside and outside the Soviet Union, came to see Khrushchev's reforms as precursors to perestroika and glasnost.

Leonid Brezhnev and His Era

Born in Ukraine on December 19, 1906, to a working-class family, Leonid Ilyich Brezhnev joined the communist youth organization Komсомол in 1923. After studying land management at a technical institute in Kursk, he became a full member of the Communist Party in 1931. During World War II, Brezhnev served as a political officer and party secretary for defense industries in Ukraine. In 1952 he became a member of the party's Central Committee, and in 1957 he joined the Politburo, the party's executive organ. After Nikita Khrushchev was removed from office in 1964, Brezhnev was appointed general secretary of the Communist Party. Brezhnev had strong ties with local and regional party leaders and probably was selected because the political

establishment wanted a less impulsive and more predictable leader than Khrushchev. Although initially Brezhnev may have been viewed as an interim leader, he held power until his death in 1982.

In what became known as the Brezhnev Doctrine, the Soviet government proclaimed for itself the right to intervene militarily in communist nations to protect its interests. In August 1968 the Brezhnev government and several Warsaw Pact allies invaded communist Czechoslovakia for the purpose of unseating Czechoslovak leader Alexander Dubček, who had set into motion the Prague Spring, a series of liberalizing reforms designed to create socialism with a human face. Later in Brezhnev's tenure, in December 1979, the Red Army invaded Afghanistan for the purpose of rescuing a client regime that was about to collapse. In protest, President Jimmy Carter boycotted the Moscow Olympics in 1980 and imposed a grain embargo on the Soviet Union. Soviet troops remained, nevertheless, until Mikhail Gorbachev ordered a withdrawal from Afghanistan in 1988–1989.

Growing military parity with the United States enabled Brezhnev to pursue what was called in the West *détente*, a relaxation of Cold War tensions. Brezhnev's government signed more than two dozen agreements on topics ranging from trade to arms control. The multilateral Nuclear Nonproliferation Treaty (1968) attempted to reduce the spread of nuclear weapons. In 1972 the Soviet and U.S. governments agreed to the Strategic Arms Limitations Treaty (SALT I) and the Anti-Ballistic Missile (ABM) Treaty. In 1979 SALT II limited the number of missiles that could be equipped with multiple warheads, but it was not submitted to the U.S. Senate for ratification because of the Soviet invasion of Afghanistan. *Détente* did not stop the arms race. Between 1964 and 1982 the number of U.S. nuclear warheads increased by more than 50 percent, while the number of Soviet warheads increased more than tenfold. Moreover, *détente* did not significantly increase trade between the superpowers. Only about 2 percent of U.S. exports went to the Soviet Union.

In previous decades, Khrushchev had tried to de-Stalinize Soviet society, leading to hopes

for greater intellectual freedom. However, under Brezhnev, prospects for a new thaw ended quickly. In a 1966 show trial, writers Andrei Siniavsky and Iulii Daniel were imprisoned for circulating satirical work on Soviet society at home and abroad, signaling at least a partial re-Stalinization of creative life. Persecution intensified after the invasion of Czechoslovakia. Some dissidents were declared insane and imprisoned in psychiatric hospitals. Courageous writers such as Alexander Solzhenitsyn continued to write unsanctioned works in an underground network called samizdat (self-publication). Meanwhile, organizations such as the Institute for the Study of the United States and Canada and the Institute of the World Economy and International Relations (IMEMO) continued to challenge official ideology, often in relatively obscure academic journals, laying the groundwork for the open debates that would later occur under Mikhail Gorbachev. Overall, however, suppression of free expression and innovation made it increasingly difficult for the Soviet Union to compete in the fast-changing world of science and technology.

After some initial economic experimentation, the Brezhnev regime decided to maintain the massive and inefficient planning apparatus it had inherited, and by the mid-1970s economic growth began to slow. Inefficient enterprises were kept afloat with state subsidies, and the growing military-industrial complex drew off much of the country's wealth. Productivity lagged for want of sufficient incentives for workers and collective farmers, and absenteeism in the workplace was rampant. Aside from bread products, state stores offered a meager supply of foodstuffs and consumer goods, and these were often of poor quality. The second economy (black market) flourished. Average life expectancy began to fall and infant mortality rates began to rise, in part the results of poor diet, widespread alcohol abuse, inadequate housing, and an underfunded medical care system.

The optimism of the Khrushchev years seemingly gave way to a more pervasive public cynicism. It is hard to ignore Mikhail Gorbachev's grim assertion that overall, the Brezhnev years were an "era of stagnation."

—Michael F. Hamm

➤ COLD WAR CHESS CHAMPIONSHIP

No chess match has been as politicized as the championship match between American Bobby Fischer and the Soviet Union's Boris Spassky in Reykjavik, Iceland, in 1972. The competition has been called the Match of the Century and was politicized as a fight between the ideological systems of the Soviet Union and the United States. Fischer, representing the United States, beat Spassky, who represented the Soviet Union, by a total of four matches after initially playing poorly. Fischer's victory caused a brief chess craze in the United States, as he had won in a field that had been traditionally dominated by the Soviet Union.

Octogenarian Era

Between the death of Leonid Brezhnev (r. 1966–1982) in 1982 and the accession of Mikhail Gorbachev (r. 1985–1991) as general secretary of the Communist Party of the Soviet Union in 1985, for a short period two men, Yuri Andropov (1914–1984) and Konstantin Chernenko (1911–1985) assumed the leadership of the Soviet Union. They both represented the aging octogenarian generation of Soviet leadership created after the Stalinist purges of the 1930s. This generation entered high levels of power after Premier Nikita Khrushchev's (1953–1964) exit in 1956, having come of age under the Stalinist years as technocrats imbued with a strong sense of socialist ideals. Loyal to Brezhnev for several decades, both Andropov and Chernenko continued many of his policies, representing the vestiges of the past with little thought for reform of the system. Along with other top leaders of the Politburo, also in their late seventies and early eighties, Andropov and Chernenko illustrated the longevity of the communist gerontocracy in

▶ SAMANTHA SMITH—CHILD PEACE ACTIVIST

One of the most memorable episodes of Yuri Andropov's 15 months as general secretary of the Communist Party of the Soviet Union (November 12, 1982–February 9, 1984) involved his correspondence with an American child, Samantha Smith. In 1982, at the age of ten, Smith wrote Andropov a letter to ask why relations between the United States and the Soviet Union were as tense as they were. Andropov wrote back in mid-1983 that the Soviet Union did not want nuclear war but rather peace. Moreover, he also invited her to visit so she could see that the Soviet people were peace-loving individuals. The exchange of letters received intense American media attention. Later that year, Smith and her family accepted Andropov's offer and visited the Soviet Union, attracting international media attention and well-wishers everywhere they went. While she never met with Andropov, she spoke with him by telephone. Although this was a minor episode in the history of the Cold War, it indicates the desires of people on both sides of the conflict to emphasize co-existence and mutual understanding even as the international situation came to a fever pitch in the early 1980s.

—Abraham O. Mendoza

charge of the destiny of the Soviet Union in the mid-1980s.

Upon Brezhnev's death in November 1982, Andropov assumed the office of general secretary. Andropov was 68 when he assumed the top position of power in the Soviet Union after serving in the upper echelons of the Communist Party since the Great Purges of 1937–1938. He was a representative of the generation that came of age under Stalin, the *vydvizbentsy* (promotees), who were ideologically motivated and trained as technocrats to build socialism in the Soviet state. Also a former KGB (Soviet secret police) chief in the 1960s, Andropov had later served in the Politburo from 1973 and secured his position as general secretary in the chaotic fight for succession by securing the support of both the military and the KGB. Chernenko would have to wait for only a short while to assume office.

Andropov's time in office is characterized by his inability to reform the Soviet system, still caught in economic stagnation and fraught with an inefficient and corrupt bureaucracy. He did manage to make some inroads in reforming the economy through policies of decentralization and incentives for industrial production. He also included within the top levels of power and in the party, at least in subordinate roles, younger members such as Gorbachev while yet maintaining much of the Brezhnev Old Guard. Andropov's attempts to address the issues of a corrupt bureaucracy were only marginally successful.

His foreign policy strategy is noted for reacting against U.S. president Ronald Reagan's (1981–1989) renewed and invigorated anti-Soviet rhetoric, especially concerning the Strategic Defense Initiative (SDI). Andropov charged that SDI was “a bid to disarm the Soviet Union in the face of the U.S. nuclear threat.” (Reagan's stern foreign policy not only troubled Andropov but also Western Europe, although not enough to improve European attitudes toward the Soviet Union.) Andropov also continued the Soviet commitment to the war in Afghanistan, which caused some grumbling among the Soviet population. While he did attempt to invigorate the rhetoric of world revolution, the Soviet Union was so fraught in stagnation that it no longer served as an adequate model of socialist revolution. Andropov became ill in August 1983 and ceased to make public appearances. He passed away on February 9, 1984.

Assuming the office of general secretary upon Andropov's death, Chernenko represented a return to the conservative policies of Brezhnev. Andropov's domestic reforms were seen as far too radical by some elder members of the Politburo. Under Chernenko's leadership, the Soviet Union rescinded some of Andropov's policies and crippled any potential reform to the Soviet economy and industry. In terms of foreign policy, Chernenko engaged the United States in nuclear talks regarding three issues: intermediate nuclear forces (INF), strategic arms limitations (SALT), and antisatellite weapons (ASAT). President Reagan would not budge on the issue of SDI, leading Chernenko to promise to expand the Soviet Union's own nuclear capabilities and triggering another arms buildup. As a result of

growing tensions, Chernenko decided on a Soviet boycott of the 1984 Olympics held in Los Angeles. Within one year of assuming office, Chernenko became deathly ill of emphysema. He passed away on March 10, 1985.

Both Andropov and Chernenko were not in office long enough to implement any long-term reforms or solutions to the Soviet bureaucracy or economy. Andropov's limited inroads in these areas were ended by his successor, Chernenko. Chernenko represented the spirit of Brezhnev and lacked the innovation needed to change the Soviet Union. To his credit, Andropov had installed Gorbachev in a position where he could seize the reins of power after the death of Chernenko. However, the remnants of Brezhnev's octogenarian clique in the Communist Party would live to fight another day, leading a failed coup against Gorbachev in 1991.

Mikhail Gorbachev Era

Born March 2, 1931, in the Stavropol region in the North Caucasus, Mikhail Gorbachev joined the Communist Party in 1952 while studying law at Moscow University. After graduating, he returned to Stavropol and worked his way through the party apparatus. In 1980 he became a full member of the Politburo. Gorbachev was a protégé of Iurii Andropov, who succeeded Leonid Brezhnev as the general secretary of the Communist Party in 1983. After Andropov died in February 1984, Konstantin Chernenko, age 72, assumed leadership of the party, but Gorbachev, who identified with the younger reformist faction, remained second-in-command. The day after Chernenko died on March 10, 1985, Gorbachev was elected general secretary at the young age of 54.

The Soviet government had monopolized the news, information, and entertainment media,

Soviet President Mikhail Gorbachev walks with a crowd of delegates to the 28th and last congress of the Soviet Communist Party (PCUS) in July 1990. (Pascal Le Segretain/Corbis Sygma)

isolating its citizens from foreign news and the grimmer realities of Soviet life. Gorbachev called for glasnost (the open and honest reporting and discussing of real issues) and perestroika (restructuring, especially of the Soviet economy). However, when a nuclear reactor at Chernobyl began to spew massive amounts of radiation into the atmosphere in April 1986, Gorbachev remained silent, speaking publicly about the accident only 18 days later.

Chernobyl dramatized the problems that resulted from internal secrecy and the ruling establishment's mistrust of and lack of concern for its citizenry, and it apparently convinced Gorbachev to commit himself fully to glasnost. Soviet journalists began to expose official corruption and incompetence and to fill in the blank spots of Soviet history. Previously forbidden topics such as crime, abortion, drug addiction, ethnic tensions and brutality in the army, and even the failed invasion of Afghanistan began to be discussed openly. Disgraced former communist leaders such as Nikolai Bukharin were publicly rehabilitated, and Lenin, the mythologized Sacred Father of Soviet communism, fell under criticism. In 1989 Gorbachev revealed that defense spending consumed 15 percent of the Soviet budget, four times what had been reported earlier. Foreign scholarly and literary works, previously banned works by Soviet authors (such as

➤ BORIS YELTSIN

Boris Yeltsin (February 1, 1931–April 23, 2007) was the first popularly elected president of the Russian Federation (1991–1999). His opposition to the antidemocratic Putsch of August 1991, which crippled the leadership of Mikhail Gorbachev, then under house arrest, made Yeltsin one of the most popularly supported politicians of the time.

Yeltsin was born in a peasant family in the Sverdlovsk region of the Soviet Union. After he graduated from the Ural Polytechnic Institute in 1955, he spent more than a decade working for construction enterprises. Since 1968, he held various positions in the state apparatus, and in the second half of the 1980s he emerged as a leader of the democratic movement and the most outspoken critic of the Politburo and Gorbachev. In August 1991 when Gorbachev was placed under house arrest during a coup, Yeltsin bravely summoned up public opposition in front of the Russian parliament, and the coup fizzled. Gorbachev's political viability had withered, and Yeltsin was elected the president of the Russian Federation on June 12, 1991.

After the official demise of the Soviet Union in December 1991, Yeltsin supported a program of economic reforms called Shock Therapy. But this program led to a severe economic crisis (inflation reached 250 percent in some months) and popular dissatisfaction, fueled by general impoverishment. Moreover, privatization of state industries and property created a class of nouveaux riches and oligarchs. In September 1993, Yeltsin signed a decree in violation of the Constitution to dissolve the Supreme Soviet and the Congress of the People's Deputies in favor of more modern political institutions. This measure led to some violent conflicts with opponents, and the events were quickly labeled Bloody October. But more blood was shed in 1994 when Yeltsin unleashed the First Chechen War, officially waged to disarm illegal

terrorist formations in the territory of Chechnya. Although the First Chechen War ended in 1996, the conflict eventually escalated into the Second Chechen War (started in 1999), which continues to the present day.

Despite his failing health, rumors of alcoholism, and some controversial economic and political measures, Yeltsin was reelected to a second term in 1996. But several bypass heart surgeries and other medical problems prevented him from being as actively involved in politics as he was during his first term. Attempts to stage economic reforms by bringing in young, innovative reformers often failed, as became strikingly obvious during the Default of 1998 (when the government refused to pay its debts). In August 1999, Yeltsin appointed little-known Vladimir Putin as prime minister. When Yeltsin resigned on December 31, 1999, according to the Constitution of the Russian Federation, the prime minister assumed the responsibilities of the president. In March 2000, Putin was democratically elected by popular vote as the new president of the Russian Federation.

Yeltsin, whom U.S. president Bill Clinton labeled “the Father of Russian Democracy,” died on April 23, 2007, from heart failure. Yeltsin spent his final years writing memoirs, managing his various funds, and traveling the world.

In mid-1988 the 19th Party Conference approved contested local elections and the creation of the Congress of People's Deputies, a partially elected, partially appointed legislature

that held its first session on May 25, 1989. These reforms, Gorbachev believed, made perestroika irreversible. He remained a committed communist, believing that a reformed party could compete successfully with other parties for popular support.

Gorbachev encouraged decentralized economic decision making and greater competition, but as firms became more autonomous, they cur-

tailed production of less-profitable items. Shortages of medicines, soap, sugar, and even bread grew worse; queues lengthened; prices rose; and rationing became widespread. Numerous private cooperatives were formed, mostly in the consumer service sector, and the leasing of state-owned farmland to collective farmers was encouraged, but such partial reforms could not put an end to long-term economic stagnation. Gorbachev had replaced 60 percent of the party's Central Committee and two-thirds of its regional and district chiefs by 1988, but the party remained divided between conservatives who feared change and liberals who sought faster and more comprehensive reform. Caught in the middle, Gorbachev was attacked by both sides. Late in 1990 he spoke in favor of privatization and free enterprise, but here too he vacillated, fearing further erosion of Soviet governmental authority.

Russians accounted for only half of the Soviet population, and nationalist movements such as Rukh in Ukraine rapidly gained support in the outlying republics. In March 1990 Lithuania declared its independence. Soviet troops, which had already attacked a large nationalist demonstration in Tbilisi, Georgia, in April 1989, moved against centers of nationalist agitation in Latvia and Lithuania in January 1991. Nevertheless, the Baltic and Caucasian republics continued to move toward independence, and Russia's parliament posed a serious challenge as well. Led by its popular president Boris Yeltsin, who had emerged as the new champion of democratization and national sovereignty, in June 1990 it declared that Russian laws took precedence over Soviet laws. Finding it increasingly difficult to govern, Gorbachev tried to re-create the Soviet Union by establishing a voluntary union of free sovereign states. The new treaty contained no reference at all to communism.

Fearing the complete breakup of the Soviet Union, on August 19, 1991, conservatives staged a poorly planned coup against Gorbachev, who was vacationing in the Crimea. In a famous scene televised around the world, Yeltsin called for resistance while standing on a tank outside of the Russian parliament. Some 70,000 Muscovites assembled to defend the parliament against pro-coup forces, and by August 21 the coup had

collapsed. After returning to Moscow, Gorbachev resigned as general secretary of the Communist Party, and the party's activities were suspended throughout the country. Yeltsin's Russian government took control of the resources and enterprises on its soil, and the other Soviet republics declared themselves independent states. On December 25, 1991, Gorbachev resigned as president of a Soviet Union that no longer existed.

Gorbachev ranks among the most important leaders of the twentieth century. He dismantled the totalitarian communist system created by Josef Stalin, moving Russia toward a law-based democratic society that accepted plural opinion and a private sector that could function beyond state control. Gorbachev deserves primary credit for ending the Cold War. He removed Soviet troops from Afghanistan and in 1989 stunned the world by allowing the communist satellites in Eastern and Central Europe to go their separate ways. Most made a quick and peaceful transition to market-based democracies. In November 1989 the Berlin Wall, a stark symbol of the Cold War, came down, and Germany, divided between a communist East and a democratic West since World War II, subsequently reunified. In 1990 Gorbachev was awarded the Nobel Peace Prize.

Post-Gorbachev Era

The Soviet Union, which collapsed in 1991, was replaced by the Commonwealth of Independent States (CIS), a loose political coalition intended to create a framework for the dissolution of the Soviet Union and an alliance for cooperation on economic, foreign affairs, and security issues. This new political structure formed by the seceding constituent republics signified a new era for the newly independent Russian Federation, Belarus, and Ukraine and the Central Asian republics of Armenia, Azerbaijan, Kazakhstan, Uzbekistan, Turkmenistan, Georgia, Kyrgyzstan,

► VLADIMIR PUTIN—TIME MAGAZINE'S PERSON OF THE YEAR 2007

The selection of Russian president Vladimir Putin as *Time*'s Person of the Year in 2007 sparked controversy among his critics. Issues raised include his questionable internal domestic control over the Russian press and regional politics in addition to his continued role in Russian politics after his presidential term ended. Despite warm personal relations with U.S. president George W. Bush, Putin's autocratic manner of governing, his engagement in the Middle East particularly with Iran, his intense criticism of U.S. foreign policy, his alleged meddling in Ukraine's domestic politics, and his threats to cut off energy supplies to the West have worried Western observers about his attempts to reassert Russian influence in global affairs.

—Abraham O. Mendoza

and Moldova and their respective transitions into global market capitalism. The end of communism in the former Soviet Union brought economic dislocation, political uncertainty, and social instability to much of the region over the next decade as these new nations adapted to free market capitalism and new political models based on Western liberal democracies. Russian domination over the affairs of the CIS, particularly over internal economic developments, has complicated matters relating to political independence from Moscow and their relations with the West (admission into North Atlantic Treaty Organization [NATO], the European Union [EU], and trade agreements). Problems concerning the Russian foreign abroad populations (particularly concerning the problem over the break-away region of Transnistria) spread out in the various CIS republics and have also created many conflicts between the post-Soviet republics and Russia.

Boris Yeltsin, the first president of the post-Soviet Russian Federation and a key figure in its emergence as a newly independent republic, ran into various difficulties in his attempts to reform Russian society and the economy. Much of this resistance came from former communists, nation-

alists, and secessionists (particularly in Chechnya). In spite of the influx of U.S. aid and financial advisers, the Russian economy suffered significant setbacks as it adapted to market capitalism. Widespread corruption, characterized by the kleptocracy formed by former Soviet officials-turned-capitalists (most significantly in the energy sector), damaged the reputation of Yeltsin's economic reforms among the Russian public. Yeltsin faced off against a Russian parliament that mirrored public anxiety over the disorganization, lawlessness, and financial insecurity instigated by his crash capitalism reforms. In spite of the chaotic situation in Russia, Yeltsin nonetheless was reelected for a second term in 1996.

Vladimir Putin emerged from a political unknown to prime minister and on to become the president of Russia. In contrast with the unpopularity of his predecessor, Putin appealed to a Russian public weary of social disorder and widespread corruption. Putin, handpicked by Yeltsin as his successor, became president following Yeltsin's resignation on New Year's Eve 1999 and was subsequently elected the following year and again in 2004. Putin attempted to reassert Russian power vis-à-vis the West, restructure the economy, stamp out corruption and crime, and assert the control of the central government over the Russian provinces. Critics allege that Putin has embraced authoritarian tactics to ensure that his policies are successful, suggestive of a dictator, in spite of post-Soviet advances toward a more liberal democratic Russian state. However, his control of the media, regional governments (by disallowing local elections), and large Russian corporations has found much support among the Russian public.

Post-Soviet Belarus and Ukraine have both found themselves seeking closer links with the West while also attempting to negotiate their economic and political ties with Moscow. In Belarus (translated as White Russia), Aleksandr Lukashenko was elected president in 1994, with promises to reintegrate the former Soviet republic with greater Russia. Amid criticism stemming from the West of his near-dictatorial control of Belarus, Lukashenko managed to alienate much of the West due to allegations over rigged elections and botched economic reforms well into

the present. Following independence, Ukraine has successfully ended secessionist movements in the Crimea seeking reunification with Russia, resolved its disputes with Russia over the Black Sea fleet, and dismantled its nuclear arsenal in agreements with Russia and the United States. However, Ukraine has continued to overhaul its economy to adapt to market capitalism and has experienced massive economic and social problems in the process. Its attempts to free itself from Moscow's control resulted in the Orange Revolution (widespread grassroots protests marked by civil disobedience, urban protests, and student activism directed at questionable election results in late 2004 and early 2005), leading to the election of pro-Western president Viktor Yushchenko. In spite of these developments, there continue to be allegations of Russian involvement in internal Ukrainian political developments, geared at drawing Ukraine closer to Russia.

The Caucasian and Central Asian republics have also confronted similar challenges to those of the other post-Soviet republics, including secessionist movements, plagued economic development, and political and economic relations with Moscow. The Caucasian republics of Georgia, Azerbaijan, and Armenia suffer from economic disarray and separatist movements. In particular, Azerbaijan and Armenia continue to be at odds over a border dispute in the south over the ethnic Armenian enclave of Nagorno-Karabakh. The Central Asian republics of Kazakhstan, Uzbekistan, Turkmenistan, and Kyrgyzstan, which have considerable populations of Muslims, struggle to maintain secularist governments bent on securing economic and political development with support from the West amid the influence of Russia from the north and Islamic fundamentalism from the south. Their proximity to hot-spots in the War on Terror (Afghanistan, Iran, and Iraq) has made them viable allies to the United States while also making them susceptible to the influence of their fellow coreligionists throughout the Muslim world. The potentiality of the development of energy industries in the region has made it a valuable location for foreign investment.

The post-Soviet republic of Moldova, located in Southeastern Europe between Ukraine and

Romania, along with troubles integrating into market capitalism has also been afflicted with secessionists. Following independence, widespread Moldovan nationalist calls for unification with Romania triggered the secession of the ethnic Russian region of Transnistria (or the Pridnestrovian Moldavian Soviet Socialist Republic) east of the Dniester River, which declared its independence from Moldova in 1990. Border issues between Transnistria and Moldova led to a war in 1992, which ended with a cease-fire later that year. Transnistria is currently an autonomous political entity, unrecognized by the international community, claiming to be a bastion of the communist Soviet Union and seeking eventual union with Russia.

Russo-Georgian War of 2008

Russia's resurgence as a world power became vividly clear in the summer of 2008 when the Georgian government's bid to restore its sovereignty over a pro-Russian breakaway region of Georgia rapidly developed into a war between the two countries.

On August 8, in response to days of minor hostilities, the Georgian military entered South Ossetia, an autonomous region of Georgia that had sought independence since the early 1990s, and almost captured its administrative center before the Russian military's intervention reversed the process. In the largest operation since the collapse of the USSR, the Russian Army repelled the Georgians from South Ossetia and then launched major land, naval, and aerial operations throughout Georgia. Many Georgian military facilities

➤ ENERGY RESOURCES AS A POLITICAL WEAPON

Europe's dependence on Russia for energy resources, 2006

More than 60% dependent: Greece, Austria, Hungary

Source: European Council on Foreign Relations, 2006 figures.

After his election in 2000, President Vladimir Putin sought to restore Russia's former grandeur and power using nontraditional methods. His policies became based on the strategy that Russia use its energy industry, particularly gas and oil, to promote the state's interests. The world's largest gas company, the Gazprom, which was originally created from the old Soviet Gas Ministry, became a key institution in this tactic. Gazprom supplies approximately a quarter of Europe's gas, with some states solely dependent on Russia for its gas demands.

Critics argue that Gazprom, closely controlled by the Kremlin, furthers the Russian government's strategic interests and uses its natural resources as a political weapon. They point to Gazprom's shutoffs of gas to Georgia in 2006 and Ukraine in 2006–2009 as examples of Russia's willingness to use its monopoly on energy supplies to punish them for pro-Western policies and to influence other states. During the most recent shutoff, in December 2008, for three weeks most of Eastern Europe remained without gas in the midst of a bitter winter until the Ukraine agreed to a threefold increase in natural gas pricing.

The 2008–2009 crisis clearly revealed Europe's energy vulnerability and relative weakness vis-à-vis Russia. Thus Germany, which receives more than 40 percent of its natural gas from Russia, has been criticized for becoming timid in its relations with Moscow following the Russian rows with Ukraine and Georgia. Germany and other European countries have repeatedly promised to diversify their energy supplies but so far remain unable to accomplish it.

—Alexander Mikaberidze

and industries were targeted, and strategic locations, including the Black Sea Port of Poti and the city of Gori, were occupied. In a dramatic reversal of its earlier policies, Moscow also recognized the independence of Georgia's two breakaway regions of Abkhazia and South Ossetia and established formal relations with them. Officially, the war ended on August 12 when Tbilisi and Moscow agreed to a European Union (EU) cease-fire negotiated by the EU rotational president, French president Nicholas Sarkozy. Practically, however, the war continued with a lesser intensity at least for another week as both Georgia and Russia accused each other of violating the cease-fire; occasional clashes between the sides took place as late as March 2009. Following a new round of negotiations, Russia withdrew most of its forces from the Georgian territory proper by October 9 but retained its presence in the breakaway regions.

The Russo-Georgian War had a significant effect on regional politics and Russia's relations with the Western countries. It sent a clear signal to the world that Russia is resurgent and ready to use force to protect its interests. The conflict severely undermined the already tense Russian-Western relations and revived fears of another Cold War. Georgia has developed a close relationship with the United States, and to Russia; such close relations inspire cause for great alarm since they imply increased U.S. presence in what Moscow has historically considered its backyard. Russia accused the United States of instigating the war as part of an American policy to secure its influence in former Soviet republics and encircle Russia. The Russian leaders also condemned NATO's eastward expansion to the Caucasus, which threatens Russia's strategic interests. Russia's intervention in Georgia prompted the angry reaction of the U.S. government and NATO, both of which described the Russian reaction as an act of aggression and a sign of rising Russian imperialism. To some, Russia's recognition of these separatist regions, which was only formally supported by Nicaragua, seemed a response to the Western recognition of Kosovo's independence from Serbia, a historic ally of Russia.

The conflict also revealed weakness on the part of the Western powers. It became obvious that the United States, tied down in Iraq and Af-

ghanistan and confronting Iran and North Korea, is in no position to oppose Russia and has to placate Russian interests in the Caucasus. The EU failed to react as a bloc since its members were divided between those supporting the U.S. call for harsher stance against Russia and those seeking to avoid further worsening of their relations with Russia, because in recent years Russia has become a major supplier of energy resources to Europe. As a result, the EU members only agreed

to facilitate a cease-fire and send humanitarian aid to Georgia.

■ Introduction: China in the World, 1945–Present

Four years after the end of World War II, the Chinese Revolution ended, the People’s Republic of China (PRC) was established, and the Republic of China (ROC) on Taiwan was separated, its ties to the West remaining. China’s navigation of the ensuing Cold War period marked its early development. Under the tutelage of the Soviet Union, the PRC modernized and industrialized in the Great Leap Forward. Ideological fervor, however, met its match in poor planning, leading to famines and hardships for China’s peasantry. In the 1950s, attempts to reclaim Taiwan and involvement in the Korean War brought China into direct conflict with the United States, the imperialist enemy. Moreover, its diplomatic and economic isolation from world affairs and its close relationship with the Soviet Union made China highly suspect in the eyes of the capitalist world in the midst of the global Cold War. However, growing ideological differences and territorial disagreements with the Soviet Union eventually led to the Sino-Soviet split. While China brandished itself as the true bastion of world communism to the developing world, contrasting itself with the revisionist Soviet Union, for strategic purposes it also proceeded to simultaneously establish closer contact with the United States in the early 1970s.

The Cultural Revolution of the late 1960s and early 1970s disrupted Chinese social and economic development and made its position in world affairs almost negligible during this period. However, U.S. foreign policy, as dictated by Pres-

ident Richard M. Nixon and his secretary of state Henry Kissinger, was geared at opening diplomatic relations with China to take advantage of its soured relationship with the Soviet Union. As a result of these U.S. overtures and the Chinese response, by the mid-1970s the PRC was no longer a pariah in the international system but instead a recognized world power with a seat in the United Nations (UN) Security Council. By 1979, the PRC had established formal relations with the United States. Moreover, the PRC had also begun to divert from its ideological state-run economic system and had begun to experiment with free market capitalism.

With the death of Mao Zedong and the re-entry of Deng Xiaoping into power, China abandoned its isolated state-planned and financed heavy industrial sectors. Instead, the Chinese economy was restructured to adapt it to the capitalist world economic system. By instituting the development of free market economic zones along the coast, which would serve as a funnel for Western investment and fully integrate with the international economic system, Deng deviated from Marxist-Leninist orthodoxy. Through the 1980s, the establishment of light-manufacturing and export-oriented industry created a thriving middle class in these coastal regions, while the interior regions of the country remained rural and poor in comparison. With its cheap labor and its bounty of natural resources, China became an integral investment zone for Japan and the United States. However, the Tiananmen Square

protest and the resultant government response illustrated that Deng was unwilling to encourage democratization in China after the Soviet Union's collapse, regardless of his willingness to encourage free market capitalism.

In the post-Cold War period, China has become an integral economic and diplomatic power on the global stage. It has the world's third-largest economy after the European Union and the United States. Along with a resurgent Russia, China has close links to Iran, Venezuela, and North Korea (deemed rogue states by the United States) and is a significant regional power in the Asia-Pacific region, much to the chagrin of the United States and Japan. With the return of Hong Kong (1997) and Macao (1999) to the PRC, the issue of Taiwan has become more contentious in China's international relations, in particular with the United States. Regardless of internal problems with separatist movements in its western provinces of Tibet and Xinjiang and despite its burgeoning commercialism, China has remained stable due to the communist state's ability to stamp out dissidents and limit free discourse. Moreover, its current skyrocketing defense spending and development of a blue water navy has created concerns in the international community of its intentions in the Asia-Pacific region. However, its economic importance to the global economy, particularly to the United States, Japan, and the European Union, suggests that international stability is crucial for China to maintain its position as a rising world power, regardless of its supposed aggressive displays.

—*Abraham O. Mendoza*

China in the World, 1945–1949

World War II ended with Japan's surrender on August 15 (August 14 U.S. time), 1945. For the Chinese, it was a moment to rejoice at the victory ending the eight-year Anti-Japanese War. Following Japan's all-out invasion of China in 1937, China had suffered devastating losses during what the Chinese term the War of Resistance. Following the Japanese surrender, the Chinese had high hopes of achieving peace, unity, and national reconstruction. Nevertheless, these hopes soon gave way to fears as conflicts resumed between the Nationalist Party or Guomin-

THE SOVIET UNION AND THE CHINESE CIVIL WAR

To speed victory in the Asian Pacific battlefield and save American lives, President Franklin D. Roosevelt established the Yalta Far Eastern Agreement with Josef Stalin in February 1945. Through promising to join the war against Japan by attacking Manchuria three months after Germany's defeat, the Soviet Union received U.S. consent regarding its control over two major ports and two railroads in Manchuria as well as actual rule in Outer Mongolia. Six months later, on August 14, 1945, the Sino-Soviet Treaty of Friendship and Alliance was signed between the Soviet Union and the Chinese Nationalists. Jiang Jieshi (Chiang Kai-shek) accepted the Soviet's controlling interest in Manchuria. In return, Stalin pledged to the Nationalist government moral, material, and military support. On account of the treaty, Stalin had to support Jiang publicly and urged Mao Zedong to negotiate with Jiang.

Even though the Sino-Soviet Treaty was a great shock and disappointment to the Chinese Communist Party (CCP), the communist leaders adjusted their policies quickly in a very pragmatic manner. They tried to enlist aid secretly from the Soviet Union. Since the Nationalist troops were still far away from the Northeast, the CCP ordered its troops to move into the area. In 1946, the Soviet Red Army withdrew from Manchuria, leaving all the armaments captured from the Japanese troops to the CCP. By November 1948, the CCP totally defeated the Nationalist forces in Manchuria and won one of the decisive victories in the Chinese Civil War.

Stalin did not have much confidence in the final victory of the CCP in January 1949. It was not until the CCP triumph appeared inevitable that he approved high-level contacts with the CCP. One day after the founding of the People's Republic of China (PRC), the Soviet Union recognized the new regime and promised to assist it.

—*Yanli Gao*

dang (GMD) and the Chinese Communist Party (CCP). Once the common enemy of the Chinese was defeated, the GMD and CCP were left to scramble for positions. By 1945, the CCP had more than 1.2 million members in North China with over 900,000 troops. The GMD had larger forces with about 2.7 million troops.

Soldiers of Jiang Jieshi (Chiang Kai-shek) set off on one of five campaigns against the forces of Mao Zedong in Jiangxi during the Chinese Civil War. (Roger Viollet)

Over the course of U.S. history, Asia has always been of secondary interest to U.S. national security, with Europe holding strategic priority in its defense strategy and national security, particularly during the Cold War years. Following World War II, the United States desired to stabilize East Asia with a U.S.-Sino alliance. On October 24, 1945, the United Nations (UN) officially came into existence. From the UN's inception, China held one of the five permanent seats of the UN Security Council with the power to veto proposed actions it opposed.

Because of wartime alliances and ideologies, the U.S. government backed Jiang Jieshi, also known as Chiang Kai-shek, leader of the Republic of China and the GMD. After Japan's surrender was announced in August 1945, U.S. president Harry S. Truman's administration issued an order instructing all Japanese-controlled forces in China to surrender their positions and arms only to Jiang's representatives, not to communist armies in the field. This American decision disappointed the CCP leaders, and Mao Zedong demanded that communist commanders move to disarm the Japanese wherever possible.

War weary, most Chinese people desired a peaceful settlement of conflicts between the GMD and the CCP. The United States pressed Jiang to talk with Mao Zedong and also asked Josef Stalin, then still a putative ally of the United

States and the GMD, to clamp down on the CCP. For the sake of its own national security and interests, the Soviet Union urged Mao to resume peace talks with Jiang. From August 28 to October 10, 1945, peace talks were arranged between Jiang and Mao in China's wartime capital, Chungking (today's Chongqing). The United States aimed to create a coalition government. However, the GMD demanded the dissolution of CCP forces, while the CCP demanded real power in the government. Although both parties signed the Summary of Conversations between the Government and Representatives of the Chinese Communist Party, six weeks of negotiations left no doubt that little progress had been made.

To avoid a costly Chinese civil war, block communist movement, and promote a united democratic pro-U.S. China, Truman sent General George Marshall to China as his personal representative to mediate in December 1945. Marshall pressed the two parties to form a coalition government; however, he was also ordered to provide at least indirect support of Jiang's activities. Marshall managed to get both sides to accept a temporary cease-fire in early 1946. Due to U.S. bias during mediation, U.S. involvement in China's internal affairs was criticized by the communists. Since Asia was less important than Europe as a national security priority, the United States decided not to intervene militarily in the Chinese Civil War, and the Marshall Mission ended in failure. In January 1947, Marshall was called back by Truman to become secretary of state.

Meanwhile, the situation in the GMD areas became much worse. Inflation was out of control, and corruption at all levels of the government was rampant. Gradually, Jiang lost the support of intellectuals, students, workers, and professionals. The CCP used land reform to build support in key areas. Inept and inert, the GMD also gave the CCP the opportunity to consolidate its forces. Mao Zedong and communist commanders worked quickly to take over Manchuria from the Soviet Union.

In the summer of 1946, an all-out Chinese civil war broke out. In the beginning, the GMD still had the upper hand. However, after two years of fighting, a radical change took place in

the war. Communist commanders took Manchuria in 1948 and Tianjin and Beiping (present-day Beijing) in January 1949. All of North China was under CCP control. Throughout 1949, the communist forces moved through South and Central China mopping up GMD forces. Jiang looked at his options; took most of the government's treasure, such as gold bars, U.S. dollars, and other valuables; and fled to Taiwan. Since then, Taiwan became the location of the Republic of China (ROC). On August 2, 1949, U.S. ambassador to China John Leighton Stuart was recalled by the government.

On October 1, 1949, Mao stood on top of Tiananmen Square and proclaimed the founding of the People's Republic of China (PRC). The communists announced that the PRC was the only legitimate government in China and that Taiwan was part of China. The PRC was recognized by the Soviet Union a day later and by the other communist states in rapid succession. Because of hostility with the United States during the Chinese Civil War and the outbreak of the Cold War, Mao's foreign policy tilted solidly toward the Soviet Union. In opposition, members and supporters of the ROC settled in Taiwan and claimed that it was still the only legitimate government of China. The PRC took over the UN seat for China in October 1971. The United States remained a strong supporter of the ROC until U.S. president Jimmy Carter established diplomatic relations with the PRC in 1979. Since then, the United States has officially referred to Taiwan simply as Taiwan but retains a commitment to defend the integrity of the island from attack. From the end of World War II to 1949 when the PRC was founded, China's role on the world stage and its relationship with other nations dramatically changed.

MAO ZEDONG

Mao Zedong (1893–1976) was born in the village of Shaoshan, Hunan Province. In 1918 he left for Beijing and worked as a library assistant at Peking University. There he witnessed the May Fourth student demonstrations of 1919 and was influenced by Li Dazhao and Chen Duxiu, the founders of the Chinese Communist Party.

In July 1921 Mao attended the First Congress of the Chinese Communist Party, which in 1923 allied with Sun Yatsen's Nationalist Party. In 1924–1925 Mao witnessed the peasants' outrage against the shooting of Chinese civilians by the British police in Shanghai and became actively aware of the revolutionary potential of the peasants. But in the early 1930s Jiang Jieshi, who succeeded Sun Yatsen as the leader of the Nationalist Party, attacked the communists in urban and rural areas. In late 1935 the communists undertook the famous Long March to escape the Nationalists' attack. After establishing a base area in Shaanxi Province, Mao eliminated the pro-Soviet faction in the Communist Party and established himself as its new leader.

Subsequently, the Anti-Japanese War (1937–1945) that became a part of World War II after 1939 enabled Mao to develop guerrilla tactics. Soon he penetrated the unoccupied areas behind the Japanese lines. Under his influence, the Chinese Communist revolution merged the Anti-Japanese War and the struggles against the Nationalist Party into a coherent strategy of mass mobilization. This strategy took the form of encircling the cities from the countryside in northern and central China. After the victory over Japan in August 1945, Mao capitalized on the popular dissatisfaction with the Nationalist Party and defeated Jiang Jieshi in the civil war. On October 1, 1949, Mao stood at the Gate of Heavenly Peace in Beijing and proclaimed the founding of the People's Republic of China.

China in the World, 1949–1971

Since the founding of the People's Republic in 1949, China had played important roles in the world. Two major dynamics determined the role of China in the world between 1949 and 1971: the rivalry between communism and capitalism and the perceived rivalry between Western imperialism and developing world nationalism. Emerging from a semicolonial background as well as a revolution inspired by the Soviet Union, China often tipped the balance of power between the two major camps in the Cold War and forged a complicated and ever-changing relationship with developing countries.

China in the world arena during the 1950s was first characterized by its role as a core member of the Communist Bloc. Upon the founding

► MAO ZEDONG'S INTERPRETATION OF THE THREE-WORLD THEORY

The post–World War II world has been typically divided into three major blocs: the capitalist First World, the communist Second World, and the rest that was lumped together as the Third World. However, Mao Zedong, the Chinese leader, had a different interpretation of this arrangement with his Three-World theory. He put the United States and the Soviet Union together as the world's superpowers, which constituted the First World. He identified this First World as the “hegemons” and the common enemies of the rest of the world. The Second World in Mao's schema was the economically more developed countries in Europe along with Japan, which were currently manipulated by the two superpowers but could potentially be the allies in the next world revolution. The rest of the world, politically independent or regions still subject to colonization—those that were mostly economically underdeveloped—made up the Third World and were the potential engine of the world revolution. As such, this interpretation of the Three-World theory justified China's role in the world as a challenger to the hegemony of the superpowers.

—Yi Li

of the People's Republic in 1949, the new government in Beijing adopted a one-sided foreign policy and concluded an alliance with the Soviet Union in exchange for Moscow's military and economic assistance. Trade with the Soviet Union and the rest of the Communist Bloc dominated China's economic links with the world, in which its inexpensive and agricultural products were sent in exchange for modern technology. China became indirectly involved in the Korean War in 1950, publicly challenging the United States, and established itself as a country set against the imperialist West. In many of the major diplomatic issues in the world, Beijing was firmly aligned with Moscow against the capitalist West and appeared to the international community as a die-hard communist country. Loud roars of anti-U.S. rhetoric, for example, echoed from the Chinese administration during the Cuban Revolution. The one-sided alignment with Moscow in world politics was complicated by China's strong anti-imperialist stand, however. As a country that had experienced humiliation by imperialists, including tsarist Russia, China was sensitive to many forms of foreign control and rejected the Soviet Union's request for the right to use Dalian as a naval base. In this aspect, China developed shared interests with many newly decolonized independent countries, such as India, Egypt, and Indonesia. In 1955, 30 or so newly independent countries gathered in Bandung, Indonesia, to discuss international politics. On this occasion, Chinese premier Zhou Enlai delivered a speech addressing the principles of anti-imperialism and peaceful coexistence. The Bandung Conference marked the birth of the Non-Aligned Movement, differentiating itself from both the capitalist West and the communist East.

In the 1960s China went on its own path as it diverged diplomatically from the Soviet Bloc. The growing schism with the Soviet Union and other members in the Communist Bloc in the 1960s ushered in a new era in which China redefined its new role in the world. While accusing Moscow of deviating from the orthodox path of Marxism and Leninism and being revisionist, Beijing stood behind Albania, which defied the direction from Moscow and strongly condemned the Soviet Union when the Red Army

➤ THE CULTURAL REVOLUTION

The Cultural Revolution in China, from 1966 to 1968, represented a power struggle between two factions within the government. State President Liu Shaoqi and then Party General Secretary Deng Xiaoping sought to promote more utilitarian economic policies. Threatened by the rejection of his own revolutionary vision, Party Chairman Mao Zedong mobilized young radical followers within China, the Red Guards, to help him remove Liu and Deng and sympathizers from power. With the Red Guards in the lead, an open period of social criticism of elites who opposed the Maoist vision was encouraged as was a cult of personality centered on Mao. Social chaos ensued as schools were closed, high-ranking officials and other “enemies” of the proletariat beaten

and killed, homes confiscated, and temples, shrines, and other symbols of tradition destroyed. The Red Guards forced many intellectuals to take on new jobs as laborers. Some PLA (People’s Liberation Army) groups that were sympathetic to the goals of Liu and Deng clashed with Red Guards, while factions of the Red Guards at times battled one another. In 1968 Mao eased the pressure and sent the disruptive Red Guards to the countryside. While Liu died in captivity in 1969, Deng ultimately returned to power and implemented economic reforms that set the course for China’s rejection of self-reliance and current emergence as a major global economic power.

—Fred Nadis

invaded Czechoslovakia in 1968. However, China's 1962 war with India marked bitter feelings in Indian-Chinese relations and cast doubts on the solidarity of the Third World. While China continued to claim that it was behind nationalist movements across the world, its support seldom materialized and therefore contributed little to China's role in the world. Nonetheless, China continued to stand in opposition to the United States. As American involvement in Vietnam intensified and the conflict escalated, China increasingly supported North Vietnam, diplomatically and materially. Throughout the 1960s large amounts of rolling stock loaded with materials was transported on the Chinese railways to the south, bound for Vietnam. As a result, both the West and the Soviet Bloc imposed economic embargos on China, which forced the country into economic isolation and on to autarky. Foreign trade became mostly insignificant within its economy, and subsequently the pace of modernization slowed down. This ideologically driven isolationism shaped China's emergent role in the world.

In 1969, a short but alarming military confrontation with the Soviet Union on a border island triggered new thinking within the Chinese leadership and steered foreign policy away from its decade-long revolutionary isolationism. Singling out the Soviet Union as its more threatening enemy, China developed a strategy for working out a better relationship with the United States and the West. Gestures and communications were made through Pakistan, a common friend of Washington and Beijing; U.S. secretary of state Henry Kissinger engineered the Secret Diplomacy to open dialogue between the two powers. The ensuing Ping Pong Diplomacy helped develop relations between the United States and China and paved the way for normalization. By 1970, the People's Republic of China was accepted as a full member of the United Nations, replacing Taiwan (Republic of China) as the sole representative of China in the organization and serving as a permanent member of the Security Council, thereby increasing the weight of Beijing in world politics at the expense of Taiwan. In 1971, U.S. president Richard Nixon announced that he was to visit Beijing in

early 1972, which signaled the dawn of the new role that China was to play in the world.

China in the World, 1972–Present

China's economic and international relations reached a turning point in 1972. Internal unrest and external threats inspired China to find practical strategies and new international alignments. The transition began in the 1950s when Chinese leaders reacted to a shift away from Stalinism on the part of the Soviet leadership by calling it revisionism. From the late 1960s, the relationship between the People's Republic of China (PRC) and the USSR, the world's two largest communist countries, continued to deteriorate. Diplomatic relations worsened as the PRC and the USSR verged on military confrontation.

In order to gain the support of other socialist countries, in the 1960s Chinese leaders published nine commentaries strongly critical of the Soviet Union. At the same time, the United States, in only one front of the Cold War, had become mired in the Vietnam War. In early February 1972, U.S. president Richard Nixon visited China and had meetings with Chinese leaders Chairman Mao Zedong and Premier Zhou Enlai. On February 28, 1972, China and the United States announced a joint communiqué in Shanghai that marked the normalization of relations after more than 20 years of hostility. Nixon called this monumental meeting in 1972 "the week that changed the world." Following this symbolic meeting, Great Britain signed a joint communiqué with China and upgraded its diplomatic representative to China to the level of ambassador in early March. In September Japanese prime minister Kakuei

Tanaka was invited to China and announced a joint statement of normalization with China.

Internally, Chairman Mao and Premier Zhou felt increasing pressure to normalize citizens' lives after much debate and unrest that had put the nation's economy at the edge of collapse. They recalled and reactivated the old guard, who had fought side by side with Mao and Zhou but who had been removed from power as a result of the Cultural Revolution launched in 1966. The most significant of these figures was Deng Xiaoping, who would eventually succeed Mao in the leadership of China. A symbolic sign of this new appeasement came when Mao attended the funeral of General Chen Yi. At the funeral, following Mao's statements, Zhou requested that Chen Yi's family members disseminate Mao's remarks that soon after freed a number of the old guard including Deng Xiaoping, Chen Yun, and Wang Zhen, all three of whom became the cornerstone of China's economic development since 1978.

In 1972, China's leaders initiated new economic policies. For the first time, leaders agreed with the State Development and Planning Commission (SDPC) to import eight production lines of fertilizer and chemical fiber, with this manufacturing infrastructure costing \$4.3 billion. This move in 1972 expanded China's import and export channels and enlarged the scale of foreign economic exchanges. It also broke the deadlock that had closed China from the outside noncommunist world since 1949. From then on, the SDPC concentrated on the development of the national economy and submitted reports on national economic problems to the Chinese Communist Party (CCP) Central Committee. Following the report, the Chinese government issued permission to Wuhan Steel and Iron Corporation to import rolling mills from Germany and Japan. This was the first and largest imported manufacturing project since the establishment of the PRC in 1949.

After Mao's death in September 1976, the country began reform efforts to become a more modern and economically developed nation. Between March and April 1976, Chinese people gathered at Tiananmen Square to mourn Zhou, who had died of cancer in January 1976. Many laid wreaths at the Monument to the Martyrs of

the Revolution. Policemen and security guards removed the wreaths at night, enraging people already opposed to the excesses of the Cultural Revolution. On April 5, a large protest erupted in the square. These protests developed into a turbulent upheaval that finally destroyed the power of the central core of the Cultural Revolution, the so-called Gang of Four, which included Mao's wife Jiang Qing as well as Zhang Chunqiao, Wang Hongwen, and Yao Wenyuan.

From 1978, Deng Xiaoping led a new economic revolution and built a new image of China in the world. However, the political destabilization exemplified by the fall of the Berlin Wall and the collapse of the Soviet Union by the late 1980s and early 1990s concerned the Chinese leadership. An impassioned student protest in Tiananmen Square urging democracy and reform of political institutions during the summer of 1989 seemed to conservative politicians to be a harbinger of similar destabilization in China. The People's Liberation Army was ordered to move into Beijing to end the protest. The violence of the confrontation was shocking to the Chinese people as well as to the international community, and the government was forced to launch a public relations campaign in an attempt to repair the damage. In 1992, Deng made an important trip to southern China and declared that the free market was not only for capitalist societies; Deng insisted that a socialist society also needed a market orientation. This historical declaration opened China's economic development into the new global era.

Deng, in addition to being the driving force behind the economic miracle, turned down the lifetime term for the leading position in the CCP and initiated a peaceful power transition, having learned lessons from the USSR's turbulent collapse and the Tiananmen Square incident that had halted China's cautious political reform efforts since 1989. Under Jiang Zemin, the leader of the third generation, economic development and living standards continued to increase. As of 2008, China had become the world's second-largest economy, following only the United States. China's gross domestic product increased tenfold between 1978 and 2008. Hu Jintao, the head of the fourth generation of leadership, initiated

the policy of the Peaceful Rise and Harmonious Society of China in world affairs to attempt to alleviate the world's fear of China's potential ambition and to comfort the less fortunate groups of people in China. Hu Jintao sought to address the increasing gap between the rich and poor and the problems of environmental deterioration that resulted from a sole focus on economic expansion. By 2007, China had become the third-largest economy in the world. The 2008 Summer Olympic Games in Beijing also solidified China's status as a leading world power that had moved beyond its former isolationism.

Economics and Trade

At the end of World War II, as the world stood in shambles amid the destruction following nearly a decade of total war, the Grand Alliance sought to reconstruct the global economy. Late in the war at the Bretton Woods Conference of 1944, with the promise to create a more cooperative world in order to prevent the economic anarchy that marked the interwar period, the United States and its Western allies sought to create a postwar monetary system to regulate commercial and financial relations the world over. This conference created the global financial institutions that would later be known as the World Bank and the International Monetary Fund (IMF), among others, to ensure the economic stability of the world economy and thereby prevent another global depression. However, amid the relative decline of European power and decolonization and as the Cold War loomed over the horizon, both the United States and the Soviet Union attempted to re-create the postwar world using their competing economic ideologies as a template.

The reconstruction of the world economy was a top priority for much of the decade following the war's end. The United States infused vast sums of money through the Marshall Plan into Europe and also invested heavily in Japan, not so much to create economic stability in these regions but to ensure the political compliance of these areas amid the fears of communist expansion. European compliance with the Marshall Plan also led to growing economic collaboration from within partly to prevent future German aggression, leading to the development of the European Economic Community (EEC), which would become the European Union in 1991. The Soviet Union also conducted itself similarly over areas under its domination, particularly Eastern Europe and China, to guarantee the development of communism. Ideology played a crucial role in the establishment of the global economy in what would be known as the First World and the Second World. However, ideological competition over the rest of the world (or the Third World), much of which was undergoing the process of decolonization from former European masters, characterized the relationship between the two superpowers. Two models of economic development, one based on the socialist planned economy and the other on capitalist free enterprise, were pitted against each other as the ideological battle between the United States and the Soviet Union ensued throughout much of the rest of the twentieth century. Much of the developing world responded with enthusiasm to the economic assistance provided by the superpowers and their allies, while some proved reluctant to ally themselves with either due to fears of political and economic domination. Newly independent

states, such as India, Yugoslavia, and Indonesia, sought a third way that did not include aligning themselves with an economic ideology promoted by the superpowers.

Through the 1950s into the 1960s, the developed world experienced an economic miracle due to the massive development of the global economy, internal redevelopment modernization of the industrial base, and the creation of a vast array of consumer goods available to populations eager to purchase such goods. States such as the United States, West Germany, Japan, Australia, and the composite countries of the ECC thrived economically until 1973 as they underwent this tremendous period of growth. In many of these countries, governments also created social security systems to ensure the welfare of the vast majority of their populations, with some providing full medical benefits, unemployment benefits, and old-age pensions for their citizens. The establishment of the cradle-to-grave welfare state, such as that in Britain, became a salient characteristic of the developed world during this period. Labor unions in much of the developed world grew in strength and political power, as they had a great level of agency in the growth of the global economy. Their prosperity and that of their employers rested on their productivity and job satisfaction, which given the economic boom was ensured. Furthermore, the booming global economy encouraged the creation of multinational corporations (MNCs), mostly with their headquarters based in the developed world, that searched for the cheapest labor markets, sources of raw materials, and laxest labor regulations to ensure maximum profits. While this process ensured the economic stability of the developed world, it also began the gradual process of industrialization over the next several decades.

The economic institutions created by the Bretton Woods Agreement, namely the World Bank and the IMF, which were intended to ensure the economic stability of the global economy, gradually became associated with Western neocolonialism by many states in the developing world and in the communist sphere. Both the World Bank and the IMF, while providing developing regions, such as Latin America, Africa, and Asia, with investment aid for developing infrastructure and industry, also demanded compliance with political, social, and economic conditions that led to various instances of economic dominance on the part of the developed world. International public opinion noted the association between the acceptance of U.S. foreign aid and the installation of pro-U.S. dictators in countries such as Vietnam, Nicaragua, and Chile.

The growth of MNCs had the effect of not only relocating industrial plant into low-labor cost world regions from the increasing cost of labor markets in the developed world, abiding by IMF economic aid conditions into doing so, but also led to the global interdependence of such regions and their relative power relations. Nonetheless, economic imbalances between the developed and the developing worlds would soon illustrate that the latter depended on the former for its abundance and prosperity.

By 1973, the world economy faced a severe crisis that thereby ended the sustained period of growth that had characterized it since the end of World War II. Related to the oil crisis prompted by the Organization

of Petroleum Exporting Countries (OPEC) in reaction to the Yom Kippur War in the Middle East, the crisis also illustrated the dependence of the developed world on oil. An economic slowdown the world over, affecting most of the industrialized world, led to massive layoffs, stagflation, and a growing sense of distrust in the existing economic system for the remainder of the decade. In contrast, the OPEC countries and many places in the developing world viewed this as a sign of the interdependence that existed within global capitalism, illustrating their level of agency within this relationship. The global economic crisis altered the liberal political structures in power in much of the developed world, which held in great importance the power of labor unions and the expansion of the welfare state, and led to the advent of economic neoliberalism in places such as West Germany, Britain, and the United States in the late 1970s and early 1980s. This led to the loss of power on the part of labor unions, the rapid outsourcing of industry and labor abroad, and the development of the postindustrial state in much of the developing world. As factories left the urban spaces of the developed world to cheaper and more environmentally lax developing countries, leaving behind so-called rust belts, the economy adjusted for the growth of service jobs that characterized the postindustrial society of much of the West. Some former peripheral areas, most notably the Four Tigers of East Asia (Hong Kong, South Korea, Singapore, and Taiwan) managed to rapidly industrialize, to the point of becoming part of the First World.

Neoliberal economic policies based on domestic economic deregulation and the development of capital markets for overseas investment in tandem with international organizations developed to increase transnational economic cooperation characterized much of the 1980s and 1990s. The collapse of the Soviet Union in 1991 led to the triumphalist call that ideological capitalism had won the Cold War and opened new regions to further investment and development under the aegis of free market capitalism. While the process of globalization accurately described the international nature of the world's economy since the sixteenth century, during this period it increased by leaps and bounds, making all sectors of the international economy interdependent on each other. Furthermore, international free market regions such as the North American Free Trade Agreement (NAFTA) in North America and Mercado Común del Sur (Mercosur) in South America, similar to the European Union, developed as a result of the understanding that such structures provide viable regional economic units. Greater cooperation among the major industrialized states of the world, such as the Group of 8 (G8) and the World Trade Organization (WTO), also illustrated this sense of awareness as they sought to set tariffs, production, and trade regulations affecting the global economy. However, there were myriad forms of resistance to this type of cooperation, as it was seen by some critics of capitalism as a way for the developed world to dominate at the expense of the developing world. Antiglobalization movements, both in developed and developing states, orchestrated protests and established nongovernmental organizations to counter the growing power of global capital and its purported abuses against the environment, labor, and the political autonomy of the developing world.

At the turn of the twenty-first century, amid massive international economic expansion, many problems continued in spite of sustained global economic growth. Within the United States, an unregulated mortgage industry that provided subprime mortgages with variable interest rates to consumers with questionable credit ratings and earnings led to the credit crisis of 2007. Allegations surfaced that major lenders engaged in predatory lending practices, which included targeting borrowers who may not have fully understood the terms of their loan or lending to borrowers unable to fulfill repayment. Such home loans often included hidden terms and conditions and exorbitant fees and often led to default, seizure of collateral, and foreclosure. The vast number of nationwide foreclosures eventually led to the economic collapse of many of the major firms that had taken part in these practices, such as Lehman Brothers and Washington Mutual in the summer of 2008. The British bank Northern Rock was nationalized by the UK government to salvage it from collapse. With these major banks reeling from lost assets, the global international markets reverberated by widespread banking closures and efforts by governments to bail out their faltering banking systems, particularly in the European Union and the United States. In the fall of 2008, international markets plummeted to their lowest point since the Great Crash of 1929, thereby illustrating the interconnectedness of the world economy. Massive layoffs, foreclosures, bank failures (and the resulting bank consolidations, such as Wells Fargo-Wachovia, Chase-Washington Mutual, etc.), and a looming world recession as a result of unregulated free market practices were the end result, with much of the world fearful of entering another global depression, akin to that of the 1930s.

■ Introduction: Globalization

Globalization refers to processes that produce an increase in economic and cultural connections across the world and, according to some interpretations, transformation from a world organized into nation-states to a single political and economic global unit. New developments in transportation and communication technology and also in international political organizations as well as an increased international flow of information, people, and goods have all aided the process of globalization through the centuries. While the processes behind globalization via trade and the accompanying cultural exchange can be seen clearly in the sixteenth and seventeenth centuries, it was not

until recent decades that globalization was given a name and became a primary focus of thought. Disputes over its origins stem from different analytical conceptions.

One conception of globalization explains it as an inexorable process based on technological innovation and driven by individuals, groups, and firms. Power is being diffused away from states and toward firms, markets, and other private entities, whose activities disseminate ideas and practices across the globe. Those activities tend to ignore the territorial boundaries of states and erode feelings of nationalism. Globalization has the effect of relocating territorial divisions to the local in some cases and to the worldwide. The

predicted result of such processes is either a global unit or a fragmented world characterized by a medieval quality of diffused and overlapping power and authority.

A second conception explains that the economic integration that is occurring in the world engenders a need for what is termed global governance. Trends toward international cooperation through institutions have developed since the end of the Napoleonic wars. These institutional efforts gained traction in the post-World War II period through the United Nations and other international intergovernmental organizations; they have accelerated in the post-Cold War period. Furthermore, international nongovernmental organizations (NGO) have proliferated, and a growing concern has arisen to protect human rights against violations wherever they may occur. The increased connections across the globe lead logically to the need to establish governing institutions that coincide with the scope of the matters that they need to deal with. Such governing institutions can be private as well as governmental.

A third conception directs attention to the activities of leading states—especially the United States in the early twenty-first century—that, through their military power, provide the stability upon which economic transactions depend. It also explains that national governments are essential to establishing systems of law, order, regulation, and other necessary conditions for secure investment and economic activities. Rather than being undermined and eroded, smaller and poorer states and societies gain wealth and power through their participation in global processes. The proliferation of NGOs and activities in the post-Cold War period are enabled to act by the existence of very strong states that embody a liberal ideology promoting private undertakings, and such NGOs are often subsidized by governments.

Globalization processes are endorsed and advocated by some and criticized and opposed by others. Among the proponents are governments, firms, and individuals who benefit from increased international trade and opportunities for economic enrichment as well as cheap goods and expanded markets. Globalization also tends to be supported by adherents of liberal ideology be-

cause it promotes freedom and individual rights. Among opponents are those who lose employment through the relocation of jobs to areas of cheaper labor, nationalists who perceive the erosion of distinctive cultures and national autonomy, and defenders of equality who regard capitalist expansion as the generator of increasing inequality. Opposition also stems from those who oppose domination of the world by the leading democratic industrialized countries, for example, Muslim fundamentalists aspiring to the establishment of a caliphate (Islamic empire) in the Arab world. Among the issues arising out of these opposed views, free trade versus protectionism is perhaps the most prominent. It is likely that should protectionism become the dominant economic policy in the advanced industrial countries, the processes of globalization would be substantially slowed down if not arrested.

Because globalization processes continue unabated, it is impossible to know what the aftermath will be. So long as the essential conditions that underlie the processes continue, increased connections across the world seem likely to be forged. These conditions are (1) the strength of the state to both provide stability internationally and ensure law and order domestically and (2) liberal ideology and policy commitment to ensure the advancement of processes such as free trade. It is possible that globalization processes could be disrupted by events. A traumatic event, such as a massive nuclear explosion, might lead to policies of autarky and withdrawal into individual nations. A worldwide depression might also weaken states and lead policy makers to turn away from international cooperation. Aside from these prospects, no one can predict what sort of future conditions continued globalization processes might produce. It seems likely that connections will increase, for that phenomenon has been going on for over a millennium.

Antiglobalization Movements

The term “antiglobalization” is often used to depict a political stance that unites people around the globe who are opposed to the neoliberal project, that is, what they perceive as a large-scale attempt to remodel and integrate societies solely on behalf of efficiency and free-market imperatives. These critics target industrial corporations and the so-called Bretton Woods insti-

tutions, namely the World Trade Organization (WTO), the International Monetary Fund (IMF), and the World Bank Group (WB). Additional targets are institutions and accords that share in the Bretton Woods Consensus, such as the Organisation for Economic Co-operation and Development (OECD), the North American Free Trade Agreement (NAFTA), the Free Trade Area of the Americas (FTAA), the Multilateral Agreement on Investment (MAI), and the General Agreement on Trade in Services (GATS). Antiglobalization activists, who refer to their movement as the Global Justice Movement, the Movement of Movements, or the Anti-Plutocracy Movement, deem both the underlying consensus as well as economic policies as incompatible with democratic, social, humanitarian, and environmental concerns. A major argument that they make is that neoliberal economic policies are elitist and short on equality and equity.

Antiglobalists argue that because neoliberal economics promote the privatization of many public services, international institutions acting on behalf of neoliberalism erode the sovereignty of states and democratic arrangements. They even accuse said institutions of eroding the very possibilities of self-government. Under the pretense of false necessities, international institutions and governments presumably act exclusively for the good of large and influential transnational corporations (TNCs) such as General Motors, Mitsui & Co. Ltd., Royal Dutch Shell, and Exxon Corporation. In the eyes of antiglobalization activists, such TNCs enjoy privileges that allow them to move freely across borders, exploit natural resources, and employ workforces below fundamental social and humanitarian standards in the name of economic efficiency. In the eyes of activists, TNCs have been endowed with abundant discretion to provide solely for their own profits. They have been given leverage to wantonly destroy culturally specific social structures and damage the environment and biodiversity around the globe if it suits their efficiency-oriented ends. Some activists claim that borders should be open not only to capital but also to the movement of persons, including migrants and refugees.

Activists hold that the fate of people around the globe depends on reconciling the legitimate

» McDONALDIZATION

American sociologist George Ritzer's *The McDonaldization of Society* (1995) and his follow-up volume *The McDonaldization Thesis* (1998) describe the process by which society has become more rationalized and uniform around the globe. Drawing from the earlier work of German sociologist Max Weber, Ritzer examines the rationalization of economic institutions and the irrationalities that this creates. As an economy reshapes itself to consumerism, it further spreads the rational principles underlying assembly line production to consumption; that is, McDonaldization occurs. According to Ritzer, this process includes imposing the elements of efficiency, calculability, predictability, and control, all central to fast food establishments and the uniformity they offer and impose. The net result is a landscape that is more predictable yet less distinct. In his preface to the later volume Ritzer notes, “While undoubtedly bringing with it many positive developments, McDonaldization also involves a wide range of irrationalities, especially dehumanization and homogenization.” Along with the postmodern critics of his era, Ritzer explores the forces imposing characteristics globally that may make the world smaller but also potentially subvert the uniqueness of place and character to create a bland consumer landscape.

—Fred Nadis

interests of rich and poor countries. They point at the crucial role of free trade in a literal sense of the word and criticize existing trade regimes for being designed so as to open markets in the developing world while at the same time protecting markets of the wealthier countries. If not reversed, this trend will continue to strengthen the power of industrialized nations to the detriment of the developing nations. Alliances such as the World Economic Forum (WEF), the Trans-Atlantic Business Dialogue (TABD), and the Asia-Pacific Economic Cooperation (APEC) allegedly bolster this trend. It is within these forums that political and business leaders coordinate public trade and financial policies with a view to enhance competitiveness, which activists take to mean increasing the power of economic elites who run multinational corporations at the expense of the well-being of people around the globe.

As a remedy against neoliberal globalization, antiglobalization activists emphasize the need of terminating legal status of TNCs and endorse dramatic reform of the WTO, the IMF, and the WB.

Post-World War II European Economic Revival

In the aftermath of World War II, Europe found itself devastated with destroyed cities, abandoned farms, 60 million dead, and millions more displaced, creating terrible economic and social conditions. Damage to the industrial infrastructure and material capital of Europe was vast. Poverty, disease, a diminished working force, low

productivity, disorganization, and socioeconomic insecurity were some of the major problems that followed the war. Former capital cities and centers of industrial production and entrepreneurial activity had been destroyed. Agricultural production was in no better condition, while malnutrition and homelessness across Europe seemed to be unsolvable problems.

The threat of a new international crisis and wars inspired the creation of the United Nations (1945). At the Potsdam Conference (1945), the Allies divided Germany into four zones of occupation. In the Far East and Africa a number of nations declared independence and engaged in anticolonial struggles with Great Britain, France, and the Netherlands. In China, communist and nationalist powers were fighting for power.

In order to avoid consequences similar to the period that followed World War I, the United States developed an interventionist foreign policy, catapulting the country into the role of global leader. With the United States already the most important regulating power of the postwar international order, it sought to develop those parts of Western Europe under its influence. Meanwhile, parts of Central Europe, Eastern Europe, and the Balkan region languished under the influence of the USSR. Among other factors, this fact and the continuous mistrust between the United States and the USSR set the basis of the Cold War.

The process of postwar economic revival of Europe took place through various processes and attempts at both the national and international levels. One such attempt was the creation of the United Nations Relief and Rehabilitation Administration (UNRRA), an organization established in June 1943 by Franklin D. Roosevelt in order to assist and financially support about 8 million refugees of World War II.

Harry Truman assumed the presidency in April 1945 after the death of Roosevelt. In Greece, communist powers were becoming influential in the civil war, and Britain declared in February 1947 that it could no longer aid Greece. Truman announced in March 1947 his plan to intervene in countries threatened by communist insurgencies. This plan, known as the Truman Doctrine, was first implemented in Greece.

In tandem with the Truman Doctrine, in June 1947 George Marshall, U.S. secretary of state,

initiated the European Recovery Program, aimed at the economic restructuring and revitalization of the wrecked European economies. At the same time, the Marshall Plan treated Europe as an investment opportunity, since financial aid to Europe would create a new market for the export of U.S. products. From 1947 until 1952, the United States provided \$13 billion in loans and financial assistance to the 17 countries that joined the Organization for Economic Cooperation and Development (OECD). For instance, the aid that it provided to France during these years was more than \$2 million, to Germany almost \$1.5 million, and to Great Britain more than \$3 million. While the USSR was intensifying control over Eastern Europe, Vyacheslav Molotov refused to accept financial support from the Marshall Plan. He also criticized it as imperialistic, for it required the participants to impose a series of political reforms. In the United States, a postwar boom took place, and a gradual revitalization of the industrial production in Germany, France, and Italy commenced in the 1950s. The Marshall Plan offered a series of benefits to the United States, opening new markets for the export of American products. Franco's Spain was excluded from the plan.

The idea that European economies could enter a process of liberal development only through cooperation and homogenization of economic interests became dominant in the 1950s. The creation of a common Western market became a priority. Postwar restructuring could be facilitated not only through cooperation with the United States but also between the European countries and through the making of commonly accepted economic rules and minimized tariffs. Thus, a new basis for the economic integration of Europe was set in March 1957, when the European Economic Community (EEC) was ratified by the Treaty of Rome, signed by West Germany, France, Italy and Benelux (Belgium, Luxemburg, and the Netherlands).

In the decades that followed World War II, most European countries faced a period of prosperity and growth also related to technological progress. The economic model of Keynesianism was dominant in most of the European countries although with important differences between them, for instance between continental Europe,

➤ ECONOMIC REVIVAL IN EUROPE— MARSHALL PLAN IN ITALY

Following World War II, much of Italy, including its economy, was in shambles. The popularity of the Communist Party in Italy (PCI), associated with wartime resistance against the Axis and the victorious Soviet Army, worried American occupation forces. The U.S. Marshall Plan, as specifically orchestrated in Italy, sought to funnel American capital into the rebuilding of the economy and to incorporate Italy into the West European Economic Community. The main goal was to prevent Italy from falling into the Soviet orbit.

The plan's aid to Italy in the first year was focused on encouraging imports of coal and grain to provide food and heat to Italians in the long and arduous winter of 1946. It also provided much-needed capital for hard-pressed industries such as textiles. However, the Italian government immediately used American aid to invest in engineering, agriculture, energy, and infrastructure in order to get the country on its feet immediately, neglecting basic consumer and food requirements of the Italian population. U.S. authorities pressed the Italians to focus on the immediate everyday needs of the population, still fearful of the popularity of the PCI. However, the nation continued to suffer from austere wartime conditions, while its government continued to pour money only into specific sectors of the economy. The United States became involved in the elections of 1948, flooding the country with narratives of the benefits of the West and of the Marshall Plan, conveyed via pamphlets, films, and even puppet shows, to ensure that the popular PCI would not form a viable government in Italy in the midst of the Cold War. Despite these wider strategic aims, the Economic Miracle of the postwar era was by and large attributable to the Marshall Plan under American auspices.

—Abraham O. Mendoza

Scandinavia, Great Britain, and the Mediterranean countries. Keynesianism was based on broad public expenditure to provide social support and stimulate consumerism. The welfare state functioned as provider of social services and financier of social institutions. The oil crisis of 1972–1973 activated a crisis in the welfare

state in Europe and contributed to its transformation to more liberal and neoliberal forms of politics.

European Union

The European Union (EU) is an international organization that is currently composed of 27 European states that cooperate in a wide variety of sectors, ranging from agriculture to the common market of goods and services to foreign policy and immigration. The common market is by far the most important area of policy making within the EU. The present EU system grew out of the European Community (EC) and was established in 1992 with the entry into force of the so-called Treaty of Maastricht. Prior to 1992, the EC had evolved from the European Coal and Steel Community (ECSC), founded in 1951; the European Economic Community (EEC), founded in 1957; and the European Atomic Energy Community (EAEC, or Euratom), created in 1958.

Plans to unify Europe were increasingly popular throughout the 1920s. Aristide Briand, for instance, popularized the idea of a European Federation in 1929. World War II and the destruction that it brought about induced high-level functionaries such as Jean Monnet and Robert Schuman to take up previous plans and elaborate a program for the establishment of institutional forms of cooperation between states. The ideas of Monnet and Schuman became known as the Schuman Plan and were embodied in the 1951 treaty establishing the ECSC.

The Schuman Plan would not have been realized without the support of the U.S. government. The United States endorsed European integration because the gradual implementation

of nontariff-based liberal economic policy promised to be an effective strategy of shifting the financial burden of reconstructing Europe back from the U.S. Treasury to the European states themselves. When the governments of Belgium, the Netherlands, and Luxembourg (the so-called Benelux countries) and Germany, France, and Italy founded the ECSC, the political purpose of the ECSC was to pool the decision-making competencies of the six founding states in matters pertaining to their steel and coal resources. Further attempts to establish communal agencies for the coordination of defense and foreign policies turned out to be too ambitious.

Yet the ideas behind these initiatives lived on and crystallized, on the one hand, in the European Political Co-operation (EPC) and eventually the Common Foreign and Security Policy (CFSP), which was introduced by the Treaty of Maastricht in 1991, and, on the other hand, in the European Rapid Reaction Force, still in formation. As these initiatives suggest, the process of European integration amounted to something that has always been more than an economic project pure and simple. Contrary to plans of individual governments (i.e., Great Britain), the majority of participants in the process of European integration aspired to some sort of political community enveloping and stabilizing the evolving economic community because, as had become clear by the 1970s, an economically integrated Europe without some form of political identity and leverage would remain inferior to the United States on the one hand and to Japan or some other Asian state such as China on the other.

The process of European integration gained its main impetus from the EEC, originally established in 1957. The EEC member states introduced a customs union, with goals that remain at the core of the EU's common market: freedom of movement of goods, services, capital, and people. With the Merger Treaty of 1967, the six founding members abolished internal tariff barriers and established the EC. During the 1970s and 1980s the EC first admitted Great Britain, Denmark, and Ireland, which acceded in 1973; Greece in 1981; and then Spain and Portugal, which both joined in 1986. The original member states looked forward to an enlarged market, while new member

states sought financial support from the EC's regional and structural funds.

As a result of the two enlargement rounds, the integration process faltered. Member states increasingly found it difficult to identify with the community mainly due to a lack of consensus regarding competencies and decision-making procedures of the EC. Yet various initiatives by the European Parliament, the Commission, and government representatives in the Council renewed faith in the EC. The Single European Act (SEA) of 1986 abolished the final barriers to the free movement of people, goods, and services and cleared ground for the deepening of the Common Market. At the same time, intergovernmental agreements allowed for the formal inclusion of the CFSP as well as cooperation in Justice and Home Affairs (JHA) in what became the EU in 1993.

The coming into effect of the Treaty of Amsterdam (1999) and the Treaty of Nizza (2003) adjusted the decision-making processes of the EU to a political system of 25 member states. The further project of establishing a European Constitution, discussed since the early 1980s to establish a more efficient division of labor between the EU's institutions, has faced insurmountable obstacles so that it is not clear yet if and how the EU may further evolve.

The current political system of the EU is often said to be more than a confederation of states and less than a federal state. The EU is a political system *sui generis*. Cooperation within the EU is either supranational or intergovernmental, depending on the matters that are being dealt with. With the 1991 Maastricht Treaty, the member states established three pillars: the EC, the CSFP, and the JHA. Matters falling within the EC are dealt with in a supranational fashion: the EC members often rely on majority votes. This means that all member states are required to comply with and implement supranational acts even if compliance runs against their avowed interest. Issues falling within the two other realms, the CSFP and JHA, however, are treated in an intergovernmental fashion. Here, decisions are made by government representatives, very often by unanimity. Independent appointees and/or elected representatives have solely advisory functions.

➤ THE EURO (€)

The official currency of the European Union's (EU) Eurozone, the euro (€), was introduced in 2002. The Maastricht Treaty of 1993 required EU members to adopt the euro once they met certain monetary and budgetary requirements. However, Britain, Denmark, and Sweden negotiated exemptions and have been able to keep their own national currencies. The Eurozone consists of 15 states: Austria, Belgium, Cyprus, Finland, France (and its overseas departments), Germany, Greece, Ireland, Italy, Luxembourg, Malta, the Netherlands, Portugal, Slovenia, and Spain. After 2003, new countries wishing to join the EU did not have the option to opt out of adopting the euro. The euro is administered, printed, and distributed by the Frankfurt-based European Central Bank (ECB) in tandem with the Eurosystem, which is made up of the central banks of the Eurozone. Currently, the euro has the largest circulation and highest combined value of any world currency.

—Abraham O. Mendoza

This system has created a new mode of complex governance that is aimed at deepening the European social and economic space through framework provisions that reinforce the willingness among the participants in the market to continue playing the game and to refrain from breaking the rules. EU policy making itself is less tied to formal processes of communication and decision making among the Commission, the Council, and Parliament. Governmental and nongovernmental actors, mostly industrial associations and lobbyists, tend to interact in informal channels of deliberation with only the partial inclusion of the public through the media. Officials ritually invoke the need to observe standards of transparency and to provide legitimation. They thus have created from within democratic accountability and have streamlined the decision-making process. Regulations foster fair competition among market players.

Complex governance in turn has been effectuated by a large and comprehensive structural change in the EU. It has been brought about by a

consensus regarding the principal importance of a common European market that is based on efficient division of labor across national societies. Various instruments have been designed so as to forge postnational loyalties and to replace social solidarities by much more diffuse solidarities in a multilevel European network society. Community policies are no longer aimed at maintaining equal living conditions but instead are meant to uphold an equality of opportunity and justice. In effect, the political system of the EU has been structurally coupled with global economic developments and is characterized by a transnational pluralism.

The EU has become the most important arena for the coordination of member states' economic policies. In matters pertaining to the Common Agricultural Policy (CAP), for instance, the EU has assumed 75 percent responsibility for the regulation of agricultural subsidies and the launching of specific programs such as land stewardship. Its influence on environmental questions is even greater. The EU is responsible for over 80 percent of all environmental regulations in the individual member states. In areas such as transport, financial matters, and health, the regulations and directives of the EU constitute 40–50 percent of all prescriptions, with many issues remaining within the discretion of the member states' governments. The EU's role regarding a common European currency and issues of Home Affairs, labor and social policy, and education and science remain contested.

The Rise of the Multinational Corporation

The multinational corporation (MNC) has become a pivotal element in the development of the international economy and the process of globalization since the end of World War II. An MNC is a corporation that has many of its facilities and other assets in at least one country other than its country of origin (where headquarters are typically located), with offices and/or industrial plants, distribution centers, and investments often in numerous countries. MNCs did exist in prior historical periods akin to modern forms (i.e., British East India Company, United Fruit Company), but the MNC's ubiquitous presence and importance to the global economy has increased dramatically since the late twentieth century. Companies such as Nike, Ford Motor Company, Starbucks, and McDonald's have various branches, subsidiaries, and franchises in multiple countries outside of their country of origin, mostly in the West (United States, European Union, and Japan).

The postwar MNCs emerged as many nationally based companies in the West shifted strategies to take advantage of the process of decolonization in much of the developing world, where many countries sought to modernize their economies with the assistance of European and American (and later Japanese) financiers. Companies such as Fiat in Italy, Ford in the United States, and Philips in the Netherlands found it beneficial to expand their manufacturing bases into developing regions (i.e., South and East Asia, Latin America, and the Near East) to assist in these nations' economic development while simultaneously taking advantage of the inexpensive labor pool and their emergent domestic markets. In turn, countries such as Mexico, Brazil, Kenya, India, and Indonesia, to mention a few, with the creation of jobs for their nationals as incentive, provided favorable conditions for corporations, offering inexpensive land, labor, and little to no taxes. Offshoring in East Asia, *maquiladoras* (border factories) in Mexico, and

sweatshops in South Asia are some examples of this establishment of manufacturing bases by MNCs in much of the developing world while slowly dismantling manufacturing throughout much of the West (i.e., the Rust Belt in the United States). However, many MNCs maintained their headquarters in the West, maintaining white-collar management professions for their nationals while eliminating the jobs of their domestic workforce.

MNCs also adopted the strategy of distributing various stages of production to many countries to circumvent tax systems and the nationalization of industries and to tap local natural and human resources. Developing countries nationalizing an industrial facility that manufactured transmissions for automobiles would find it increasingly difficult to operate it without the availability of parts. Petroleum MNCs, such as Royal Dutch Shell, British Petroleum, and Chevron, have multiple facilities globally, including transit and distribution networks, refineries, and gas stations. Controlling the infrastructure keeps such MNCs profitable even when they may lose direct control of oil fields to nationalization.

In the late twentieth and early twenty-first centuries, MNCs have aroused much resentment throughout much of the developing world and even within the developed world. Associated with the twin evils of globalization and U.S. global economic influence, MNCs have been accused of being instruments of neocolonialism and instrumental to the creation of a global American culture. International institutions such as the World Trade Organization (WTO), the Group of Eight (G8), the World Bank, and the International Monetary Fund (IMF) are seen as the tools of MNCs in the alleged subjugation of the developing world. U.S. foreign policy has also been strongly criticized as being a mere instrument of the whims of MNCs and their global reach, among them the controversial coups assisted by the Central Intelligence Agency (CIA) in Iran, Chile, and Nicaragua, and the Iraq War.

Critics, ranging from Marxists to Islamic fundamentalists, allege that MNCs contribute to the erosion of local and regional values that become replaced with consumerist values while also exploiting labor and natural resources for their own benefit. However, advocates for MNCs would ar-

➤ UNITED FRUIT COMPANY AND NICARAGUA

Instances of the influence of early U.S. multinational corporations affecting the political destinies of their so-called banana republics were quite common in the period following World War II. The classic case of the United Fruit Company (UFC) in Nicaraguan affairs is perhaps the most enlightening. The U.S.-based United Fruit Company held a domineering position in the economy of the Central American country of Nicaragua through much of the early twentieth century that was virtually untaxed by the national government in power. Bananas represented approximately 40 percent of Nicaragua's exports, making it substantially dependent on that economic sector. The company also held considerable investments in the nation's infrastructure in the form of ports, railroads, and land development.

In the 1950s, Jacobo Arbenz was elected president of Nicaragua and proceeded to enact sweeping land reform to the benefit of Nicaraguans. However, this included nationalizing UFC land not in usage. This ignited U.S. accusations of communist infiltration of Central America and the need to intervene. The subsequent U.S. government involvement in the issue was highly controversial given that the current secretary of state, John Foster Dulles, was a UFC stockholder and once had been a UFC lawyer, while his brother Allen Dulles, the director of the Central Intelligence Agency (CIA), which was responsible for planning the subsequent coup, had once been president of the UFC. The CIA, in league with a Nicaraguan rightist clique sympathetic to the United States, staged a coup against Arbenz in 1954 and installed a right-wing Guatemalan colonel amenable to U.S. interests and those of the UFC. The company changed its name to United Fruit Brands in 1970 and then to Chiquita Banana in 1985.

—Abraham O. Mendoza

gue that they are merely spreading investments to viable sources of profits, creating and expanding their global markets, and developing national economies by sustaining infrastructural development and creating employment. Steady critiques of their environmental practices have led some MNCs to simply greenwash their practices, while others have invested considerably in

developing more sustainable manufacturing and management processes.

Japanese Economic Miracle

The Japanese Economic Miracle denotes the rise of Japan from the ashes of World War II to become one of the most modern economies worldwide in the span of four decades. Already in the nineteenth century Japan was most successful among Asian countries in adapting modern Western technology and administration during the Meiji Restoration. The rise of Japan to become the dominating power in East Asia that began in the Meiji was abruptly stopped with Japan's defeat in World War II. Industry and basic infrastructure were widely destroyed, territorial acquisitions that followed 1894 were separated from Japan, and the United States governed the country through the Supreme Command of the Allied Powers (SCAP). Millions of ethnic Japanese who had settled in former colonies had to be reintegrated. In 1948, the powerful prewar family-based industry conglomerates, the *zaibatsu*, were limited in power, with family members banned from holding official positions. Inflation, unemployment, and shortages threatened the stability of Japan.

However, with the onset in 1950 of the Korean War and its industrial demands, Japan's economy rapidly grew. Industrial production increased by 36.8 percent in 1951 alone. Overall, from 1950 to 1973, the Japanese economy expanded by almost 10 percent a year. In the 1970s it still grew by an average of 5 percent a year and in the 1980s by 4 percent a year. Among the characteristics of the Japanese postwar economy were the strong influence of the state on industrial planning, in particular by the Ministry

of International Trade and Industry (MITI); the reemergence of dominant business groups, *keiretsu*, with strong horizontal and vertical integration and so-called house banks catering to the specific needs of a certain conglomerate; a labor market with enterprise unions open only to employees of one company and therefore closely interested in the fate of their companies; lifetime employment; and the rapid adaptation of technology. In the period from 1950 to 1973 the strong contribution of factor productivity to growth was particularly remarkable.

Explanations for the Japanese Economic Miracle continue to clash. In the 1950s and 1960s, scholars such as George Allen argued that Japan was a successful model of modernization due to U.S.-led economic and political reform, massive inflow of American aid, and low defense spending due to the alliance with the United States. Japanese economists challenged this view and pointed to the successful modernization efforts of the nineteenth century and hence the cultural roots of the Japanese Economic Miracle. Chalmers Johnson has stressed the role of the MITI and sparked a debate about Japan's success as a developmental state. Other analysts were skeptical about the almost mythical power of foresight attributed to the industrial policy of the MITI. Mancur Olson placed the destruction of powerful distributional coalitions, in particular the *zaibatsu* and the related military-industrial complex, at the heart of the growth success of Japan in the postwar period, a record that is consistent with the later decline of growth rates.

A key factor of growth was the export orientation of Japan's industry, which at the same time was protected by selective liberalization, allowing the free importation of inputs and intermediate goods and a closed market for consumer goods from foreign countries. The low value set for the yen in the international monetary system during Bretton Woods helped Japan to accumulate large trade surpluses. International economic integration into General Agreement on Tariffs and Trade (1963), the International Monetary Fund, and the Organisation for Economic Cooperation and Development (1964) aided the internationalization of Japan's economy.

Japanese economic growth remained impressive until 1989, and the miracle had enormous

impact on Japan's East and Southeast Asian neighbors, as did direct Japanese investment. However, in the 1980s the initial virtuous circle of accumulation, in which cheap credit by banks played an important role, became a vicious circle of debts for companies too big to fail, and the prolonged existence of these so-called zombie companies led to two decades of slump in the 1990s that continued into the 2000s and has greatly diminished the appeal of the Japanese economic model.

World Bank

The World Bank, more specifically the World Bank group, is a subsidiary agency of the United Nations (UN) Economic and Social Council responsible for providing financial assistance in the form of loans and financial recommendations to less developed countries (LDCs). Established by the major Allied powers near the end of World War II, the World Bank has been a significant fi-

Workers build a dam on Chile's Rapel River, about 1965. The hydroelectric project was largely funded by the World Bank which makes loans to developing countries. (National Archives and Records Administration)

ancial institution responsible for the development of the global economy for the past half century. From its inception at the Bretton Woods Conference in 1944, the World Bank has provided billions in loans to assist nations throughout the developing world to help establish industry, infrastructure, employment, and commerce through its two major institutions, the International Bank for Reconstruction and Development (IBRD) and the International Development Association (IDA). However, critics have alleged that the World Bank has undue control of the economies of developing nations, with its policies making them subservient to the economic needs of the creditor nations of the developed world, notably the United States, the European Union (EU) nations, and Japan.

The World Bank was first established as a means to alleviate the economic dislocation of

INTERNATIONAL MONETARY FUND

The International Monetary Fund (IMF) is an agency of the United Nations (UN) with the specific function of stabilizing international monetary exchange rates to promote global economic stability. In 1944 during the latter stages of World War II, the IMF was established by the Bretton Woods Agreement to endorse international monetary cooperation and the stabilization of currencies to better stimulate the expansion and growth of world trade. This was to meet the challenges of the postwar period, assumed to be fraught with major economic dislocations and widespread reconstruction projects amid the destruction caused globally by warfare. The IMF also assisted member nations confronting temporary difficulties in foreign exchange payments.

Much like the World Bank, the IMF has been heavily criticized regarding the stipulations and conditions attached to its loans and the substantial influence of the creditor nations of the developed world in its institutional policies. The debt crisis in Latin America in the 1980s made many South American nations increasingly dependent on the IMF, which in turn demanded neoliberal economic policies and austerity schemes from the governments in power as conditions for extended loans and the restructuring of old debts. Many critics also allege that the IMF has failed to prevent the environmental damage created by some of its funded projects, supposedly encouraging less-developed countries to destroy and exploit their natural resources and thus creating massive deforestation, soil erosion, and desertification.

—Abraham O. Mendoza

countries devastated by World War II. At Bretton Woods, the Allied countries established specific economic guidelines and policies to ensure future global economic stability to prevent global depression and war akin to those of the previous two decades. The first major institution of the World Bank, the IBRD, began its operations in 1946. Following postwar reconstruction investment projects, in later decades the IBRD began to provide loans to creditworthy developing nations globally for massive development projects. The second major institution of the World Bank,

the IDA, was established in 1960 for the specific purpose of working with the poorest developing countries to reduce widespread poverty by improving living conditions and infrastructure and forging economic development. In the context of the global Cold War (1945–1989), some scholars suggest that such investments in the developing world were made with the foreign policy objectives of the United States and U.S.-affiliated developed nations of preventing such LDCs from falling under Soviet political, economic, and military dominance.

In the decades following the end of World War II, the World Bank developed three affiliate organizations to assist and supplement the operations of the IBRD and the IDA, ensuring the effective flow of capital to development projects in the developing world. The International Finance Corporation (IFC), established in 1956, has since been responsible for promoting investment from the private sector into the economies of developing nations. The International Center for Settlement of Investment Disputes (ICSID), created in 1966, addresses major investment conflicts between governments and private foreign investors, arbitrating between the two parties to resolve such disputes. The Multilateral Investment Guarantee Agency (MIGA), created in 1988, has the responsibility of promoting foreign investment into the economies of LDCs.

The organization and bureaucracy of the World Bank grants representation to a vast number of countries throughout the world, yet the influence of major contributors is substantial. The president of the World Bank is elected to a five-year term by the group's executive directors. He is also chair of the Board of Executive Directors. The president is responsible for managing major World Bank business, including that of the IDA and the IFC. As the major subscriber to the World Bank, the president of the United States nominates the president of the organization, subject to the approval of the Board of Executive Directors. The executive powers of the World Bank are held by the Board of Governors, which delegates most of its powers to 24 executive directors. The five major subscriber countries—the United States, the United Kingdom, Germany, France, and Japan—appoint 1 director each, while governors from the other member coun-

tries, organized into major geographic groups with similar regional economic interests, elect the remaining 19 executive directors. China, Russia, and Saudi Arabia are also entitled to select 1 director each. Meeting once a month, the executive directors' major duties are to represent the interests of their individual or regional grouping and decide the general direction of bank policy.

Theoretically, the World Bank and its subsidiary affiliates base their decision to lend solely on economic considerations, based on creditworthiness and return of profit from projects in the developing world. However, critics of the institution have charged that political influence, nepotism, corruption, bad investment advice, and inefficient bureaucracy plague the evaluation and financing of projects. Some critics also allege that the World Bank, in addition to the International Monetary Fund (IMF), are mere tools of capitalism and increased globalization, seeking to plunder the developing world through such neoliberal economic policies as free trade, lowered trade barriers and tariffs, and cheap labor flows. These policies establish neocolonial arrangements such as offshoring, outsourcing, and sweatshops that subject LDCs to economic dependency on the developed world, particularly the United States, the EU, and Japan.

Controversy over U.S. nomination of the president of the World Bank, specifically Paul Wolfowitz in 2005, has led some critics to allege that the institution is simply a tool of global U.S. economic hegemony. However, as the world's largest source of aid to LDCs, the World Bank has funneled billions of dollars to the developing world (Africa, Latin America, South Asia, Oceania, etc.) and after the end of the Cold War to the nations of the former Soviet Union. These World Bank-sponsored investment projects have contributed to the economic well-being of millions of people. As recently as 2004, the IBRD approved approximately \$11 billion to invest in as many as 87 projects in multiple countries. These loans and grants encouraged private sector development, the development of trade and infrastructure networks, urban development and improvement projects, and environmental and efficient resource management.

Postindustrial Society in the West

The conceptualization of a postindustrial society emerged in 1973 with the release of David Bell's *The Coming of Post-Industrial Society*, which depicted the then ongoing economic transition of developed societies in the West from a manufacturing-based economy to that of a service-based economy. The transformation of the United States and much of Western Europe from industrialized societies to postindustrial societies in the late twentieth century is directly related to the development of industry elsewhere in the world, particularly Asia (China, Taiwan, South Korea, Singapore, and Hong Kong). The flow of manufacturing capital from the traditional centers of manufacturing in the West (North America, Western Europe, Japan) to the developing world (China, Latin America, Southeast Asia) has led to drastic societal and economic changes as both sides navigate the transition.

The shift to a postindustrial economy is characterized by the transition from the production of consumer goods to the provision of services. The production of such materials as steel and such products as televisions declines in relation to the vast increase in service industries such as fast food, marketing, investment brokering, and personal training. However, while services dominate in a wide range of economic sectors, health, education, research, and government services are pivotal for a postindustrial society to maintain its competitiveness.

In both the United States and Western Europe, the percentage of goods manufactured overseas increased over the course of the latter

► THE U.S. RUST BELT

This General Motors auto manufacturing plant in the Rust Belt city of Flint, Michigan, was closed in the 1980s. (Bob Krist/Corbis)

The Rust Belt is a geographical area encompassing parts of the Midwest and Mid-Atlantic regions of the United States characterized by postwar de-industrialization where heavy industry and steel mills closed down due to their unprofitability or were relocated overseas to tap inexpensive labor pools (offshoring). The Rust Belt region extends west of the Boston and Washington metropolitan areas into eastern Wisconsin. It also stretches southward to the coal mining regions of West Virginia and northward to the Great Lakes industrial region (Michigan, Illinois, Ohio, and Indiana). Similar economic woes struck coal, steel, automobile, and heavy manufacturing regions in England, Belgium, and France during this period.

The loss of jobs in the U.S. Rust Belt due to de-industrialization in tandem with the transcontinental migration to the Sun Belt (southern states such as Georgia in the United States) and the West have led to a significant decline in the populations of the Rust Belt states. However, the Rust Belt is still a substantially important economic sector of the United States, responsible for a high level of industrial output. While the loss of manufacturing jobs has left many metropolitan areas in this region with increased rates of poverty and crime, the dire situation has also encouraged the region to diversify economically. New professional fields undergoing substantial growth in this region include nanotechnology, biotechnology, and information technology among other high-tech sectors.

—Abraham O. Mendoza

half of the twentieth century as corporations began to seek ways to evade strong labor unions and the taxes that the welfare state demanded. Multiple factories closed, and corporations, while maintaining headquarters in their country of origin, established new factories abroad in regions with little to no property taxes and an inexpensive labor pool. While some manufacturing sectors continue, they have remained vulnerable to wage depressions caused by the global labor market that has damaged their international competitiveness. This offshoring of manufacture has also led to the development of rust belts, or regional deindustrialization, in the United States, Canada, and much of Western Europe in areas that had typically been industrial centers in the nineteenth and early twentieth centuries.

The transition to a postindustrial society forces a wholesale change in professions calculated as a percentage of the domestic workforce. In both the United States and Europe, the development of a large white-collar labor force in tandem with a large nonskilled service labor force has been a long-term structural process occurring since the end of World War II. During the transition from an industrial base, the importance of blue-collar manual labor significantly declines in contrast with the increase in professional and technical employment, which eventually becomes a sizable majority of a society's workforce. New sources of employment, such as specialized engineering (genetic and computer), computer programming (and other related high-technology occupations), and marketing, develop a high level of importance in a postindustrial society, on par with older respectable professions such as law and medicine. However, lower-end service jobs such as clerk, cashier, short-order cook, and sales or retail associate also become more widespread yet are often poorly paid with little to no benefits. The rise of such service jobs were popularized as "McJobs" in Douglas Coupland's novel *Generation X* (1991). The income gap between high-end professions and lower-end service employment with little backing by labor unions enforces vast socioeconomic differences in postindustrial societies. In recent decades, the processes that undergird the development of Western postindustrial societies have begun to occur in other world regions. Countries

such as Taiwan, South Korea, and Singapore, typically associated with manufacturing and large-scale industry, have recently begun developing large percentages of white-collar professions, growing in relation to the older industrial professions. The increase in wage levels in many of these countries has also reduced the level of investment by multinational corporations, with multinationals choosing instead to invest in other regions with cheaper labor pools. In another more recent development, the offshoring of labor is not the only drain on postindustrial societies. The more recent outsourcing of white-collar service jobs from the developed North to areas such as India illustrates the vulnerability of professional workers as well in a global economy.

Development Gap—The North and the South

The conceptualization of what has been termed the North-South paradigm (or development gap) is characterized by the social, economic, and political division that exists between the wealthy developed countries collectively known as the North and the poorer developing countries or least-developed countries (LDCs) known as the South (Latin America, Africa, and Asia). Although most nations comprising the North are located in the Northern Hemisphere (Europe, Russia, Canada, and the United States), the divide is not simply defined by geography, as wealthy countries

➤ LATIN AMERICAN DEBT CRISIS

The Latin American debt crisis refers to a period in the late 1970s through the 1980s when the foreign debt of many Latin American countries exceeded their actual earnings, and they were thus unable to repay creditors. Throughout the 1960s and 1970s many Latin American countries, especially Brazil, Argentina, and Mexico, borrowed huge sums of money from international creditors, particularly the World Bank and the International Monetary Fund (IMF), for various industrial and infrastructural projects. At the time, these countries had stable growing economies, so creditors readily provided huge loans.

However, as Latin American economic growth slowed due to the declining prices of their commodities in the world market, a simultaneous increase in U.S. interest rates in the early 1980s triggered a crisis in Latin America. By 1982, Mexico announced its inability to fulfill its loan obligations. Brazil and Argentina found themselves in a similar predicament, with large percentages of their respective gross domestic product (GDP) directed toward simply paying interest on their debts. These countries' inability to repay those debts made them increasingly dependent on the IMF, which required neoliberal economic

reforms and severe austerity measures in exchange for debt restructuring and emergency loans. The resulting compliance with these conditions was evidence of the dependence that Latin American countries had on the U.S. and European economies and the relative gap in wealth that existed between the Northern and Southern Hemispheres.

The debt crisis also led to greater demands for economic independence from foreign domination and drastic political changes from the late 1980s to the present. It fueled the creation of greater economic cooperation among Latin American nations (in the form of Mercosur) as well as cooperation with the United States (Mexico and the North American Free Trade Agreement) through free market agreements. In addition, it strengthened leftist opposition parties in many Latin American countries (Venezuela, Brazil, Bolivia, and Ecuador) bent on seeking economic autonomy from international control. Nonetheless, recent debt problems in Argentina as of 2009 continue to illustrate the level of dependence that Latin American economies have on global economic fluctuations emanating from the West.

—Abraham O. Mendoza

in the Southern Hemisphere such as New Zealand and Australia are also included as part of the North. The historical legacy of nineteenth-century and early-twentieth-century European colonialism has shaped the postwar neocolonial relationship that much of the developed world has with the developing world in terms of economic links (foreign investment) and international financial dependency fostered via the practices of the World Bank and the International Monetary Fund (IMF). This situation has led many scholars to be highly critical of the inequitable distribution of wealth between the North and the South, with the poverty of the South contrasted with the opulence and high standards of living in the North.

At the end of World War II, much of the colonized world under the European yoke rapidly acquired its political sovereignty in Africa, Asia, and Oceania. While the process of decolonization eliminated this form of political dominance, economic domination continued, emanating in particular from the United States and Western Europe. However, in the midst of the Cold War, many of these former colonies with their newfound independence could choose to align themselves with either the capitalist West (led by the United States) or the socialist East (led by the Soviet Union). Through the international financial organizations of the World Bank and the IMF, the West was able to invest increasingly large sums in projects in the developing world. However, in this process the West gained substantial economic influence over the internal policies of the newly independent developing world, often at the expense of the latter. The geographical divide that characterized this relationship gave rise to the designations of North and South by social scientists.

Through the 1960s and the 1970s, the South found itself increasingly subject to the economic domination of the North, as expressed through free trade policies, World Bank and IMF stipulations for continued investment, and international agreements made by countries in the North without consulting the South. These agreements included the General Agreement on Trade and Tariffs (GATT), the World Trade Organization (WTO), and the Group of Eight. Many organizations sought to represent the interests of the

South; these included the Non-Aligned Movement (an international organization of states not formally aligned with or against the United States or the Soviet Union in the context of the Cold War) and the Group of 77 (a United Nations coalition of developing nations) as well as ideological movements such as Maoism. However, a lack of unity in these groups, given the diversity of cultures and interests represented, posed a serious problem to countering the monolithic North. Furthermore, former less-developed countries began to enter the ranks of the wealthy North (e.g., the Four Tigers: South Korea, Taiwan, Singapore, and Hong Kong), while others currently are on the brink of doing so and have gained an interim status (Mexico, Brazil, and Turkey). This lack of unity has prevented any successful engagement between the North and the South.

The demographic explosion that occurred in the latter twentieth century vastly increased the wealth gap that exists between the North and the South. Much of the world's population growth since the end of World War II has taken place in the South, in contrast with the marked decline of populations in the North. It is estimated that in the North between 1960 and 1980, the size of the population of the age group 20–39 years old increased by 58 million, in contrast with 360 million in the South. This demographic pressure severely exacerbates the existing problem of the inequitable distribution of wealth given that the South is already less economically developed and is fraught with poverty and unemployment. This has led to increasing levels of immigration from the South to the North, as evidenced in the United States by illegal immigration from Latin America and in the European Union by illegal immigration from North Africa and the Middle East.

■ Introduction: Economic Policy since 1945

Following World War II, the global economy was in shambles; only a few states, such as the United States and some neutral states, were relatively unscathed. The Bretton Woods Conference of 1944 set down a series of guidelines for global economic policies that would prevent the sort of protectionism that defined state policies in the interwar period in the midst of global depression. In the context of the emergent Cold War, U.S. aid to Western Europe and Japan contributed to the restoration and eventual flourishing of their economies. However, the Cold War also created two competing economic models that served as examples for the newly decolonized economies of the world. The U.S.-backed West embraced Keynesianism, with its emphasis on state stimulus spending, along with the development of the welfare state in an effort to balance social needs with a free market. In opposition, the Soviet model offered the command economy, with its requisite bureaucratization and lofty production goals, geared toward ensuring the industrial development of the nation within a Marxist-Leninist framework.

From the late 1940s to the oil shocks of the mid-1970s, the Western model proved most attractive, regardless of the increasing economic dependency of the developing world. Some Latin American and Asian states established policies of import substitution (domestic industrial development) as a means of lessening their dependency on the West but continued to rely on institutions such as the World Bank and the International Monetary Fund to achieve such ends. However, with the global economic atrophy of the mid-1970s, austerity was embraced by much of the West, severely affecting much of the developing world. In Latin America, as exports dried, the total foreign debt blossomed from \$2.3 billion in 1970 to \$340 billion in 1983, creating a severe crisis. Soviet and Chinese economic stagnation also proved the limitations of the command economy model; under such a model, innovation frequently was deemed ideologically unsound.

In the 1980s British prime minister Margaret Thatcher and U.S. president Ronald Reagan advocated neoliberal economic policies that began

dismantling the welfare state and deregulation and privatization of business. With the dissolution of the Soviet Union and the end of the Cold War in the last decade of the twentieth century, neoliberalism begat the acceleration of globalization throughout much of the world. Developing regions such as China and India became economic powerhouses that shared in the benefits of globalization, contributing to increased social mobility for significant portions of their populations.

In spite of the growth of the world's economy by leaps and bounds since the end of the Cold War, neoliberalism's heyday was short-lived. By 2008, a looming global recession illustrated that the reckless practices followed by an unregulated financial and business sector in much of the West could lead to a downturn and the atrophy of the world's economy. As of 2009, Western governments looked once again to Keynesianism as a way to preserve the balance between the free market and the well-being of their respective populations. Dependent on the capitalization of their economies by the West, as of 2009 much of the developing world remained in financial crisis.

—Abraham O. Mendoza

Bretton Woods Agreement

The Bretton Woods Agreement created a system of international monetary cooperation among the world's major industrial states near the end of World War II in 1944. This system established guidelines for financial and commercial relations through a stable monetary order among the participants. Bretton Woods included a system of regulations, international financial institutions, and procedures to regulate the international monetary system. Countries abiding by the agreement were expected to adopt a monetary policy that fixed the value of its currency exchange rate to one bound to the gold standard. Bretton Woods is regarded as the first internationally negotiated settlement regarding global monetary stability in the interests of the international community.

The Bretton Woods Agreement was established in anticipation of the end of World War II

EXCERPTS FROM THE BRETTON WOODS AGREEMENT (1944)

The Bretton Woods Agreement (1944) required the cooperation of participant nations to fixed monetary exchange in terms of the gold standard and the U.S. dollar. The agreement necessitated that the participant nations abide by the obligations and responsibilities stipulated in the agreement, creating the first global monetary system in world history.

“ARTICLE VIII. GENERAL OBLIGATIONS OF MEMBERS

Section 1. Introduction

In addition to the obligations assumed under other articles of this Agreement, each member undertakes the obligations set out in this Article.

Section 2. Avoidance of Restrictions on Current Payments

- (a) Subject to the provisions of Article VII, Section 3 (b), and Article XIV, Section 2, no member shall, without the approval of the Fund, impose restrictions on the making of payments and transfers for current international transactions.
- (b) Exchange contracts which involve the currency of any member and which are contrary to the exchange control regulations of that member maintained or imposed consistently with this

Agreement shall be unenforceable in the territories of any member. In addition, members may, by mutual accord, co-operate in measures for the purpose of making the exchange control regulations of either member more effective, provided that such measures and regulations are consistent with this Agreement.

Section 4. Convertibility of Foreign Held Balances

- (a) Each member shall buy balances of its currency held by another member if the latter, in requesting the purchase, represents
 - (i) that the balances to be bought have been recently acquired as a result of current transactions; or
 - (ii) that their conversion is needed for making payments for current transactions.

The buying member shall have the option to pay either in the currency of the member making the request or in gold.”

—Abraham O. Mendoza

and the subsequent rebuilding of the world economy. The disastrous economic dislocations created by the Great Depression of the 1930s and the subsequent rise of fascism and communism in the interwar period (1919–1939) were blamed on the absence of a uniform international economic system. The ultimate purpose of the conference was to promote international economic cooperation and to prevent the financial disasters that had crippled the world economy in the 1920s and 1930s. In July 1944, 730 delegates from all the Allied nations met at the Mount Washington Hotel, a remote hotel in Bretton Woods, New Hampshire. The delegates attending the United Nations Monetary Financial Conference established the aforementioned agreement.

The Bretton Woods Agreement comprised an exchange rate regime with rules to adjust monetary rates. The monetary rates of those abiding by the agreement were fixed to the U.S. dollar.

The increased military and political power of the United States at the end of World War II ensured that it was the most stable economy, so it followed that the U.S. economy should be the standard. Imbalances between the monetary systems of all respective countries would be alleviated through the financial institutions created by the agreement.

The Bretton Woods Agreement created the International Bank for Reconstruction and Development (World Bank) and the International Monetary Fund (IMF), which were operational by 1946. The IMF would prove to be a valuable yet controversial institution in the developing of the international economy, particularly in the so-called Third World. The purpose of these institutions was to ensure the resolution of monetary imbalances by promoting investment in nations unable to abide by the regulations of the agreement.

The Bretton Woods Agreement was in effect from 1946 to 1971. European economic recovery of the postwar years is attributed to the economic stability created by the agreement. American global economic hegemony is also attributed to the existence of the Bretton Woods international cooperation in subservience to the American dollar. The end of Bretton Woods was a result of growing disaffection with the gold standard in the aftermath of the massive inflation in the United States due to the Vietnam War (1961–1975). President Richard M. Nixon took the United States off the gold standard in 1971 and essentially ended the agreement.

Gold Standard

There are numerous advantages and disadvantages of adhering to a strict gold standard. One of the biggest advantages of a strict gold standard is in its ability to force discipline over fiscal and monetary policy. A gold standard imposes restraints on fiscal policy since governments cannot print money to finance expenditures but are instead required to increase the funds through taxation. On the other side of the coin, even if government-induced inflation is eliminated, inflation will still occur whenever large new gold reserves are discovered. In addition, if new gold reserves are not discovered quickly enough, economies face the even bigger problem of disinflation. A strict gold standard also would largely eliminate the use of discretionary fiscal and monetary policy to increase output in a recession or to slow growth if the economy is growing too quickly.

After World War I many countries experienced high budget deficits, inflation, and currency depreciation that made it increasingly difficult to maintain strict conversion. Beginning in 1931 Britain abandoned full convertibility,

› CURRENCY CHANGES

Two of the most important changes in world currencies since 1945 were the formation of a single European currency and the slow movement toward a cashless society. On January 1, 1999, the euro became the official currency of the 11 member countries representing the European Union (Austria, Belgium, Finland, France, Germany, Ireland, Italy, Luxembourg, the Netherlands, Portugal, and Spain). This change streamlined financial market transactions, reduced the cost of travel within Europe, and facilitated foreign and intra-European economic trade by reducing the transaction costs associated with separate currencies.

The development of electronic funds transfer technology in the mid-twentieth century brought about credit cards, debit cards, and online banking. Noncash transactions are quicker, less expensive, and safer. Despite the many advantages of eliminating cash and the proliferation of cashless options, individual privacy concerns have resulted in a continued growth of cash transactions.

—*Joseph Cavanaugh*

and by 1936 all remaining countries did the same. In July 1944, 730 representatives from 44 nations met at the United Nations Monetary and Financial Conference at Bretton Woods, New Hampshire. The ensuing agreements placed the world economy on what is often referred to as a gold-dollar standard. The Bretton Woods system did not use a true gold standard since gold reserves did not back the issued paper currency.

Over this period the increase of transactions outpaced the supply of gold, so countries throughout the world moved to fiat money, which is money whose value is based only on faith in the issuing country. By the 1960s and 1970s the economy of the United States was the largest in the world, but relative to other economies around the world it was diminished, as Europe and Japan grew increasingly important to the world economy. In the United States the balance of payments deficit grew steadily, and domestic inflation prompted President Richard Nixon to implement price controls. An attempt to balance the situation by devaluing the dollar failed to work, and in 1973 the Bretton Woods System

collapsed. Any semblance of a gold standard was over. In recent times many economists continue to rely on gold as an important macroeconomic indicator, and as recently as the high-inflation years of the early 1980s, many called for a return back to an international monetary system based on the gold standard.

Since the 1980s currencies values have generally been set by market demands. The advent of virtually 24-hour per day currency trading around the world through the Internet has created vast pools of money available for lending or trading. The globalization of currencies has in some cases led countries to peg their currencies to the dollar or the euro. Both currencies are also used for stating the current price of oil per barrel.

With the development of a globalized economy, especially with the enormous growth of the Middle Eastern oil states and the Chinese and South Asian economies, the demand for gold increased. Most of the growth was for use in industrial products. When also used as jewelry or kept as a store of value in safe places by individuals such as major purchasers in the Middle East it is removed from economic activity, which keeps it from earning interest or returns. Some countries such as South Africa mint gold coins for sale (Krugerrand). The central bank of some countries also collects gold as a safe financial reserve. The need for an expanding money supply to fund the investments, production, and consumption in these new markets has been accomplished through monetary mechanisms other than gold.

Keynesianism

Keynesianism, or the belief in Keynesian Economics, began following the publication of John Maynard Keynes's book *The General Theory of Employment, Interest, and Money* in 1936.

Keynes's book, commonly referred to as just *The General Theory*, was one of the most influential economic books ever written, and its publication is widely recognized as marking the beginning of macroeconomics as a discipline of study.

Prior to the 1930s, economic theory was grounded by a few principal beliefs. Namely, the economy would achieve efficiency if individuals were left to act in their own interests, and flexible interest rates, wages, and prices in the economy would automatically self-adjust to maintain full employment. These elements of classical theory supported a capitalist economy with a government role that was limited to supporting free enterprise through contract enforcement or by implementing and defending private property rights.

During the late 1800s and early 1900s these key tenets would be questioned as a result of a dramatic growth of market power and increased economic volatility. At the time, whole industries were controlled by a few large companies, and governments were largely unsuccessful at controlling their power. In addition, the world economy would struggle with one prolonged recession after another, leading to the Great Depression of the 1930s.

The General Theory, and subsequently Keynesians, focused squarely on the inability of the economy to quickly adjust to ensure full employment and on the role that governments should take to influence the economy. Keynesians believed that wages and prices would not fall in a recession, so unemployment would persist as long as aggregate demand for goods and services was low. In addition, even if prices decreased, this would not lead to an increase in employment. Wages would also decline, and workers would recognize that their real wages remained the same. Keynesians used a model of aggregate demand crossing a 45-degree line to demonstrate how fiscal policy could be used to increase output and employment in a recession. In this model, later called the Keynesian Cross, any initial increase in government expenditure would result in a total increase in output many times greater than the initial expenditure. This is known as the multiplier process. During a recession, Keynes demonstrated that it is impossible to use monetary policy to lower interest rates enough to

increase output. For this reason, Keynesians advocated government expenditures over monetary policy intervention.

In the late 1930s the world economy was quickly pulled out of the Great Depression, as World War II resulted in many governments spending huge amounts on war efforts. This resulted in unemployment being almost immediately eliminated and provided support for the Keynesian Theory. After the war, Keynesianism was well accepted throughout the world, and nations enacted laws and policies that would ensure that economies maintained full employment. Since the enactment of these Keynesian policies, the size and frequency of recessions and the levels of unemployment have been reduced. The increase in the level of national debt for many countries throughout the world may also be, in part, a result of Keynesianism, since Keynes demonstrated how government expenditure financed by borrowing is more effective than when the expenditure is financed through taxation.

Keynesianism fell out of favor in the 1970s and 1980s when government intervention was ineffective at dealing with the simultaneous problems of high unemployment and inflation. By the 1990s the macroeconomic theory of rational expectations and the classical ideology based on free markets operating with limited government involvement again became the dominant orthodoxy. The global economic downturn that began in 2008 with the collapse of the financial firm Lehman Brothers in New York and the subsequent collapse of numerous banking institutions once again brought Keynesian thought to the fore. The U.S. government's multibillion dollar stimulus plan instituted in 2009 as well as similar plans in Britain, France, and Japan were all squarely in the Keynesian mode.

➤ CHAMPIONING THE FREE MARKET

One of the world's most influential critics of Keynes was the Nobel Prize-winning economist Milton Friedman (1912–2006). Contrary to Keynes, Friedman demonstrated that increasing the money supply causes output and employment to increase in the short run. In 1963, Friedman and Anna Schwartz argued in their coauthored book *Monetary History of the United States, 1867–1960*, that the Great Depression resulted from actions taken by the Federal Reserve. Also contrary to Keynes, Friedman believed that short-run unemployment and inflation fluctuation could best be reduced by mandating a money supply rule that would increase the money supply automatically at the same rate as real output growth. This would effectively eliminate the discretionary power that the Federal Reserve has over the money supply, which is an idea that has not been supported by the Federal Reserve. Friedman is best known for being a steadfast advocate of free markets. As a professor at the University of Chicago, his emphasis on a limited role for government and the superior decision-making ability of the individual over governments formed the basis of what became known as the Chicago school of economic thought. In the work *Capitalism and Freedom* (1963), Friedman provided arguments supporting education vouchers, a volunteer army, and the elimination of licensing for doctors. Although at the time this book was not widely read, in 1976 Friedman won the Nobel Prize and rose to public prominence. His book *Free to Choose* (1980), coauthored by his wife Rose, became a best-seller, and his television series of the same name was aired on the Public Broadcasting System network across the nation.

Command Economies

The command economy is a unique feature of the communist systems of the twentieth century, found in the former Soviet Union and its East European satellites (until 1989–1991), China, Cuba,

► COMMUNISM IN CUBA—SURVIVAL IN THE POST-COLD WAR WORLD

Following the collapse of the Eastern Bloc in 1989 and the Soviet Union in 1991, Cuba has remained one of the few outposts of communism resistant to the winds of change. Without the support of the Soviet Union in terms of economic assistance, trade, and diplomatic weight in global affairs, Cuba faced the United States alone. China, the other major communist power, had already fallen into the orbit of global capitalism, sustaining its communist political structure by adapting to market capitalism. However, Cuba retained its socialist command economy in spite of a continued U.S. embargo and limited economic activity with generous neighbors in Latin America.

In recent years Cuban leader Fidel Castro has formed closer links with socialist Venezuelan president Hugo Chavez, leading to a vast infusion of economic aid that has propped up Cuba's tottering regime. State rationing of resources for the domestic population, in spite of a thriving export economy, has maintained a low standard of living for many Cubans. Cubans rely on a thriving black market for many goods and services that the state has failed to provide. In spite of these failings, the current Cuban communist regime has survived under the authoritarian Raul Castro, Fidel's brother, who is now that nation's nominal leader and continues to see Cuba as the vanguard nation of the forthcoming communist revolution in Latin America.

—Abraham O. Mendoza

Vietnam, and North Korea. The command economy is characterized by the responsibility of the party-state (typically communist) to set economic priorities and monitor their fulfillment through the state bureaucracy and the local party organizations. The party-state makes decisions regarding investment, resource allocation, labor-management relations, and social insurance for workers, allowing for little to no involvement of citizens. This is due to the ideological assumption that the state represents the will of the people (dictatorship of the proletariat) and therefore is already cognizant of their needs in the building of a socialist society.

The Soviet Union created the first centrally planned economy based on Marxist-Leninist precepts under the reign of Josef Stalin in the 1930s, and similar plans were introduced into Eastern Europe (Czechoslovakia, Poland, Hungary, Romania, Bulgaria, and East Germany) at the end of World War II. The command economy entered China in 1949 upon the victory of the Chinese communists under the leadership of Mao Zedong. Later in the century, command economics would find variants in other communist regimes throughout the world, in socialist countries such as Ethiopia, Vietnam, Cambodia, North Korea, and Yugoslavia under either Soviet or Chinese auspices, even though such communist nations remained nominally independent in the context of the Cold War. The Soviet command economy model served to illustrate to these economically peripheral areas how the party-state played a considerable role in the economic development and modernization of an otherwise undeveloped and economically marginal country.

In a command economy, the Communist Party assumes the leading role. The party-state has the power to decide what is to be produced, how it will be manufactured, and by whom it will be consumed. The party-state sets economic priorities and resource allocation (typically prioritizing for heavy industry at the expense of consumer goods). Such priorities are handed down to bureaucrats, local party officials, and managers in the form of instructions. These instructions set general goals for major industries, announce major changes in economic policies, set targets for agricultural output, and outline the state budget in terms of investment in particular economic sectors. The party-state is also responsible for monitoring and delegating responsibility from the national down to the regional and local authority to ensure that its directives are fulfilled.

Critics of the command economy practiced by communist regimes in the twentieth century allege that such total government control over the economy has many shortcomings (evident in policies of collectivization in the Soviet Union, the Great Leap Forward in China, and other instances in the smaller communist regimes). The need for the party-state to assume ultimate authority over the economy has led in many in-

stances to excesses and episodes of widespread violence and death. Purges, intimidation, and incarceration (particularly in the infamous Gulag in the Soviet Union) have been used as tactics by the party-state to ensure obedience to its economic policies, thereby undermining efficiency and incentive on the part of individual bureaucrats and managers. To ensure their livelihood and existence, these officials overestimate their output figures in accordance with the party line. Moreover, the government allocation of resources to heavy industry and its neglect of consumer goods and luxuries has led to a thriving underground black market in many of the socialist states that ensures a steady supply of these products. In this way, the command economy also unofficially institutionalizes criminal organizations as an integral part of society, undermining its legitimacy in the eyes of the citizenry. Legitimacy is further corroded as average rank-and-file citizens with tedious employment, shoddy housing, and inadequate social services see privileged high-party officials (known as the *nomenklatura* in the Soviet Union) living in wealthy surroundings and with access to Western goods in a supposedly socialist egalitarian society. Productivity and waste are rampant, as workers often lack incentive due to their meager wages and lack of access to consumer goods, severely undermining the party-state.

The Emergence of the Welfare State in Europe

The post-World War II West European welfare state, particularly in Britain, emerged from the experience of governments in centralized wartime planning for the well-being of citizens. Following World War II, states such as Britain, France, Belgium, Denmark, Sweden, the Netherlands, and Italy all created comprehensive government bu-

reaucracies that administered wide-ranging social policies such as national health care, social security, unemployment insurance, and workers' compensation benefits to their respective citizenries. These institutions increased the level of state intervention in the day-to-day lives of the citizens. However, after the economic decline that followed the Organization of Petroleum Exporting Countries (OPEC) Oil Crisis of 1973, the huge cost of public expenditures would provoke a reaction as European economies stagnated. Conservative governments in the 1980s—advocates of neoliberal free trade policies and adamantly opposed to state intervention in social matters—seriously curtailed funding of the welfare state. In the late 1990s and early 2000s, the welfare state was still under scrutiny, blamed for squandering much of the state's wealth and for high taxes in an era with limited economic potential.

The welfare states were instituted almost immediately after the war to assist in the rebuilding of the economy along with postwar reconstruction aid in the form of the U.S. Marshall Plan and European economic cooperation (European Coal and Steel Community). In wartime Britain, the Beveridge Report of 1942 presented a social security plan that covered all British citizens. At war's end, the recommendations of the report were rapidly implemented. The National Insurance Act (unemployment insurance), the Industrial Injuries Act (workers' compensation benefits), and the National Health Service Act (medical insurance) were all implemented in 1946, coming into effect in 1948. In France, similar social policies were instituted beginning in 1945 with the *sécurité sociale*, building on pre-existing social programs from before the war. West Germany implemented social insurance programs of its own in the early 1950s, building on Weimar and National Socialist-era precedents. Scandinavian states, most significantly Sweden, also established government-sponsored social provisions for their respective citizens. The Swedish welfare state, which was based on government cooperation with industry and labor, became a notable model for expanding social benefits amid full employment. After 1950, social welfare protection was extended to all citizens in Western Europe in various forms of universal health insurance, free education at all

➤ SIR WILLIAM BEVERIDGE AND THE WELFARE STATE

William Beveridge, popularly known as the “father of the welfare state,” was the son of a humble colonial civil servant in British Bengal. Born in Rangpur in the British Raj in 1879, Beveridge went on to study in England at Balliol College in 1897. In his early professional life, he became a social worker, quickly familiarizing himself with the drudgery and deprivation of the lower social strata of Britain. During World War I, he was involved in various governmental committees and ministries related to war economic mobilization, state planning, and rationing. He became more committed to state interventionism during the Great Depression, becoming an advocate of state planning in an era when such a concept was associated with Bolshevism.

The outbreak of World War II in Europe allowed Beveridge the opportunity to make substantial changes to British perceptions of the state’s role in public welfare. In 1941, he served as the chairman of the Interdepartmental Social Insurance Committee and worked with economist John Maynard Keynes to create a comprehensive plan for a national insurance policy. Known as the Beveridge Report (1942), it stipulated the rights of British citizens to full employment, social security, and universal health care. In drafting such a plan, Beveridge laid the foundation for the creation of the British postwar welfare state in 1945.

—Abraham O. Mendoza

levels (particularly higher education), and in some countries job training. Maternity leave (sometimes even paternity leave), paid vacations, state-financed housing projects, and low-rent housing were also implemented in later years in most West European countries.

Only by implementing higher taxes and focusing much of the state’s wealth on public expenditures could West European states afford to sustain their welfare states. The expenditures associated with the welfare state increased substantially from 1950 to 1980, leading some politicians and economists to believe that it was fast becoming a liability to economic prosperity. For

example, in 1950 Britain spent 35 percent of gross domestic product (GDP) on public expenditures, increasing to 38 percent in 1965 and 46 percent by 1980. The Netherlands was spending 60 percent of its national wealth in public expenditures. Funding such programs led West European states to introduce substantial income redistribution policies through high levels of taxation and concentrating a large amount of GDP into their state budgets. Progressive taxation rates often exceeded 50 percent of personal incomes. In some instances, it was as high as 70 percent in the highest income brackets. Tax rates averaged 30 percent in Britain and between 20 percent and 25 percent in Germany, France, and Belgium.

The 1973 Oil Crisis, triggered by OPEC’s displeasure at Western support of Israel during the Yom Kippur War of that same year, had significant reverberations in the international economy. After three decades of untrammelled growth and prosperity, Western Europe was severely affected by the Oil Crisis as well as by the subsequent dismantling of the Bretton Woods economic system. The welfare state, which had grown by leaps and bounds in the previous decades of economic expansion, was now assailed. Growing unemployment and economic stagnation, coupled with high taxes, made critics of the welfare state more outspoken.

In the late 1970s and early 1980s, conservative politicians came into power in Britain (Margaret Thatcher) and West Germany (Helmut Kohl), reflecting the changing perception of the role of the welfare state. While such politicians had some success dismantling some aspects of social programs and cutting public expenditures, they did not undo the major programs that formed the initial core of the welfare state, such as national medical and unemployment insurance. Apparently, after nearly a half century of existence, the welfare state was not something that could be done away with overnight, as it had become part of people’s expectation of their government’s responsibility to the citizens.

In the late 1990s and early 2000s, the welfare state was threatened further by neoliberal economic ideology that advocated free trade policies and lower taxes. Increased global economic interdependence and competitiveness triggered

substantial criticism of the welfare state. Neoliberals insisted that high taxation for public expenditures hampered private investment and in turn economic growth in a competitive global market. In addition, the welfare state had the additional strains of paying for the increasing needs of an aging European population in an era of substantial population decline. West European states found that their welfare states would be unable to support their older populations in the future if the system was not substantially reformed. In particular, Margaret Thatcher became notorious for cutting social spending and selling off state-owned industries. Germany and France both have internal ongoing political debates concerning potential cuts due to the increasing costs of social security spending as their nations face a rapidly growing older population.

Neoliberalism

Neoliberalism, an abbreviation of the term “neo-classical liberalism,” is a political movement that advocates economic liberalism (free market ideologies) as a means of promoting economic development. Neoliberalism also emerged as a rejection of the political and social liberalism espoused in much of the West in parties of the Left (i.e., the Democratic Party in the United States and the Labour Party in Britain) that had targeted social ills and sought economic equity through social programs and government agency.

Neoliberalism denotes a group of neoclassical-influenced economic theories, including libertarian political philosophies typically espoused by the political Right, and political discourse that emphasizes government control over the economy as inefficient and detrimental to ex-

➤ THATCHERISM IN THE UNITED KINGDOM

Thatcherism, attributed to the political and economic policies of British prime minister Margaret Thatcher, was characterized by her fervent support of minimal state intervention in the national economy. When Thatcher took office in 1979, Britain was troubled with increasing inflation and high levels of unemployment. Thatcher immediately promoted an unrestrained free market and a monetarist policy (controlling the money supply to fuel economic growth) for the United Kingdom. She also sought to privatize many state-owned businesses, such as telecoms and coal mining concerns, seeking to deregulate the economy as much as possible. She also slashed taxes in order to promote investment in the private sector by those who could afford to do so. Her assertive attack on trade unions led to their decreased influence in British society after decades of considerable power and leverage vis-à-vis the British state. Furthermore, her policies also led to a considerable dismantling of the welfare state.

Thatcherism was similar to its contemporary ideological equivalents, Reaganomics in the United States and Economic Rationalism in Australia. Similar to the tenets of Thatcherism, these neoliberal economic policies stressed a philosophy of individualism, which insisted that state mechanisms to promote social equality only hampered initiative and also advocated a free market and minimal government regulation of the economy. These new economic policies, which encouraged the dismantling of the costly welfare state's social safety net, led to increasing poverty. Although Thatcher's policies aided corporate wealth and international competitiveness, during her three terms in office (1979–1990), the United Kingdom suffered from widespread unemployment, racial unrest, ubiquitous homelessness, and increasing poverty levels.

—Abraham O. Mendoza

pansion. Critics suggest that this is an attempt at reverting to the classical liberalism of the late eighteenth and nineteenth centuries promoted by political economist Adam Smith. Specifically, neoliberalism refers to a recent reemergence of classic economic liberalism's influence among

economic scholars and policy makers during the 1970s, particularly in the West (United States, European Union, and Latin America).

Neoliberalism is not a uniform political philosophy or set of economic theories but instead is a shift in social and political thinking espousing decentralized government planning of the economy as opposed to the centralized control that emerged in the late twentieth century.

While British economist John Maynard Keynes had argued that the social stability provided by welfare was a prerequisite of overall economic health, in the late 1960s the demands of the welfare-state systems began to strain the international financial system. After three decades of economic expansion and political soundness, Keynesian doctrine was questioned. Neoliberal arguments gained currency after the stagflation crisis of the 1970s, prompted by the Organization of Petroleum Exporting Countries (OPEC) Oil Crisis of 1973 and the end of the Bretton Woods Agreements. As a result, political factions in various countries in Europe (Gaullists in France, Conservatives in Britain), the United States (the Republican Party), and Latin America (Augusto Pinochet in Chile, the Institutional Revolutionary Party [PRI] in Mexico), typically on the political Right, supported political and economic arguments in support of free markets and little government regulation of the economy.

Economists such as Friedrich Hayek of the Austrian School of Economics and Milton Friedman and Arnold Harberger at the University of Chicago Economics Department developed the theory behind neoliberalism. These intellectuals advocated strict fiscal policies, competitive exchange rates, free trade, privatization, and limited state intervention in the economy. Strict fiscal policies ensured that governments would cut their expenditures on social programs, on which the welfare state was based, and impose tax increases to end deficit spending. Exchange rates would remain competitive on a global scale, where governments would accept market-driven currency prices to encourage investment and trade.

Neoliberals also encouraged the widespread acceptance of free trade and the requisite removal of protective tariffs, government subsidies, and trade barriers. Along with free trade, pri-

vatization was heavily encouraged, transferring state-owned industries to the private sector. Lastly, neoliberal economic theory strongly encouraged governments to limit their intervention in business, focusing on encouraging rather than preventing foreign trade. All of these measures stimulated the interlinking trends later described as globalization.

Neoliberal theory influenced policies across the globe, from those unhappy with the welfare state and Keynesianism in the West to those unhappy with slow development in Latin America and to policy makers in the newly freed East European countries eager to adapt to the global market by adopting capitalism. In the early 1980s, Western politicians such as British prime minister Margaret Thatcher and U.S. president Ronald Reagan became famous (or notorious) for their implementation of neoliberal policies, such as the dismantling of the public sector industries in Britain at the hands of Thatcher and the decreased expenditure in social programs prompted by Reagan. Critics from the Left of the political spectrum suggested that these policies would lead to the slow dismantling of the welfare state and growing economic insecurity for the most vulnerable in society, resulting in poverty, homelessness, and crime.

Elsewhere in the world, the mounting developing world debt crisis of the 1980s and the fall of the Soviet Union and its satellites across Eastern Europe prompted neoliberal theorists to encourage others to deregulate their economies and support international free trade. In Eastern Europe, the new policies led to widespread graft, corruption, and economic hardship for a great majority of the citizens. Countries such as Mexico and Argentina—held by single-party dictatorships, fraught with debt, and in economic shambles—also sought to adapt neoliberal policies that contributed to a growing gap between rich and poor. This led some critics to accuse nations such as the United States and Japan of neocolonialism when they took advantage of neighboring Latin American and Asian countries' cheap labor. Nations such as Bolivia and the Philippines found themselves shackled to conditions set by the World Bank and the International Monetary Fund, which pulled them into the world market by allowing their labor to be ex-

ploited for the needs of the global free market. As a philosophy and movement, neoliberalism has had an enormous social and cultural impact.

■ Introduction: Trade

The United States had a crucial role in reshaping the world economy in the postwar period. During much of World War II President Franklin D. Roosevelt's administration made plans for the postwar years. This involved both plans for the occupation of countries and for trade. The Bretton Woods Agreement of 1944 focused on currency, as currency stability and convertibility were essential to free trade. This, however, was not enough.

The Marshall Plan (European Recovery Program) was implemented in 1948 in order to give money as grants to European countries as part of a reconstruction program. The aim was to rebuild the western European economy and ensure stable democratic governments in the region. The long-term goal was to grow the volume of free trade, although there was a requirement that participants in the Marshall Plan import U.S.-produced goods.

Trade had been greatly reduced during the years of the Great Depression because most countries had instituted tariffs (import taxes) in an attempt to keep out foreign goods that competed with their own domestic producers. To counter this trend, a number of institutions were developed to reduce trade barriers or to resolve trade disputes.

During the decades of the 1950s and beyond, the focus of trade negotiation was usually on tariff barriers to trade. These could be negotiated on a bilateral or multilateral basis. Other negotiations in the decades of the 1960s and afterward were over nontariff trade barriers. In this category were trade barriers that involved cultural attitudes, often involving inspections to prevent the entry of foreign goods into local markets.

Trade issues also include actions by countries that were aimed at preventing the exporting and selling of goods at prices below the market rate, known as dumping. Some countries subsidized their industries and overproduction for political reasons. Although often economically unsound, the practice of dumping was often the result of political policies that kept a nation's workforce employed making more goods than could be sold at market prices. It was also a tactic to dominate markets and crush competition.

Among the institutions developed to handle trade issues was the General Agreement on Tariffs and Trade (GATT), which became the leader in tariff negotiations following the failure of the International Trade Organization (ITO) to be accepted as the agency for trade management. GATT lasted from 1947 until 1995, when it was replaced by the World Trade Organization (WTO). The WTO is the only institution that administers the rules of trade among the nations of the world.

Numerous other organizations were formed to promote regional trade. In the decades since 1945, economic growth was flourishing in Europe and Japan by the 1960s. By the 1980s many Asian countries such as Korea, Indonesia, Malaysia, and others were joining together into economic organizations. Europeans were moving toward the formation of the European Union. States were organizing to promote free trade in Latin America as well, where Mercosur (Mercado Común del Sur) was founded in 1991. In post-Mao China, a new focus on manufacture and export allowed its trade surplus to steadily grow, making China, as of 2009, the world's second-largest economy, based on gross domestic product (GDP).

The North American Free Trade Agreement (NAFTA) was signed in 1992 and implemented in 1994. The agreement reduced barriers and increased trade between the United States, Canada, and Mexico, with flows in goods, services, jobs, and money across all borders. Critics noted that NAFTA also led to a loss of labor union power and a shift of manufacture to *maquiladoras*, or factories with sweatshop conditions, often entirely financed by U.S. or multinational capital, in Mexico just across the border from the United States.

Aiding the growing volume of trade was the development of global trading in securities, currency speculations, and electronic banking. The development of the Internet allowed for trade orders to be processed much more rapidly. Other inventions such as cargo containers and cargo shipping improvements supported the huge growth in trade that was supporting a world population that was rapidly urbanizing and had more than doubled between 1945 and 2009.

The growth in trade was the concern of the leaders of the world in the G-8 and the G-20, which are the countries producing about 80 percent of the world's goods and services. A parallel concern was the poverty in the other countries of the world. The concern encouraged a number of programs for promoting development through foreign aid or through other mechanisms. At the same time, escalating environmental problems prompted discussions that led to the Kyoto Protocol (1997), aimed at the limitation of carbon dioxide emissions. Conceivably, while offering new markets in carbon trading, enforcing such limits could trigger a general downturn in economic growth that would coincide with the environmental ethos of limits.

—*Jack Waskey*

North American Free Trade Agreement (NAFTA)

The North American Free Trade Agreement (NAFTA) was signed between the United States, Canada, and Mexico in 1992 and implemented on January 1, 1994, creating a free trade zone among the three countries. In addition, NAFTA has been supplemented by two further treaties: the North American Agreement on Environmental Cooper-

ation (NAAEC) and the North American Agreement on Labor Cooperation (NAALC). These two treaties provided consistent environmental and labor standards for the three member nations to abide by after the creation of the North American free trade zone. However, while NAFTA has led to considerable growth in the economies of the composite nation-states, it has also sparked disputes regarding labor and environmental issues.

Inspired by the success of the European Economic Community (European Union after 1993), North American politicians such as U.S. president George H. W. Bush, Canadian prime minister Brian Mulroney, and Mexican president Carlos Salinas de Gortari pushed for the economic integration of North America through the creation of a free trade zone, a reduction of tariffs and duties, and the free movement of investment capital. In the early 1990s the previously mentioned three major North American heads of state as well as their immediate successors (Bill Clinton in the United States, Jean Chrétien in Canada, and Ernesto Zedillo in Mexico) were all keen supporters of NAFTA. Despite opposition from vast segments of their national publics, which feared a loss of jobs, national sovereignty, and economic independence, by 1994 it was ratified by the governments of the United States, Canada, and Mexico. The NAAEC and the NAALC were included to assure environmentalists and labor organizations that NAFTA would have uniform provisions for environmental and labor concerns, thereby allowing for its ratification.

Controversy surrounding NAFTA has been widespread in all three countries. Accusations that U.S. jobs would be lost to both Canada and especially Mexico were sounded by public figures such as 1992 U.S. presidential candidate Ross Perot as well as by vast segments of the public. In Canada and Mexico, many viewed NAFTA as an infringement by the United States on their political and economic sovereignty. Furthermore, some people in all three countries feared that this was the first step in the creation of a large North American supracountry (the mythical North American Union), which would eventually erode national political autonomy and ethnocultural characteristics.

Following the implementation of NAFTA the Zapatista Army of National Liberation (EZLN)

under the leadership of Subcomandante Marcos declared its opposition against the Mexican government and NAFTA. This action fixed international attention on the gross economic inequalities created by NAFTA, as U.S. agriculture poured into Mexico and the *maquiladoras* were built on the Mexican edge of the U.S.-Mexico border, much to the detriment of peasants and workers in Mexico. The devaluation of the Mexican peso that year was also attributed to the large-scale economic dislocations resulting from NAFTA. In the United States, criticism ranged across the political Left and Right. On the Left, liberals, antiglobalization activists, and environmentalists argued that NAFTA was another form of exploitation to the detriment of Mexico (and Canada). On the Right, libertarians, xenophobes, and nationalists argued that NAFTA encouraged the migration of jobs to Mexico's cheap labor pool while triggering further deindustrialization in the United States. Canadian opposition, while similar to that in the United States, was less noticeable since NAFTA was mostly positive in its effects.

Current criticism of NAFTA alleges that it continues to exploit Mexican vulnerability vis-à-vis the United States and Canada while also exporting jobs to Mexico. Furthermore, U.S. agricultural policies have allegedly led to the uprooting of thousands of peasants from southern Mexico who have migrated not only to Mexico's largest cities but also to the United States through illegal immigration. While NAFTA has ensured the growth of the economies of North America, it has done so at the expense of farmers and workers in all three countries, albeit at differing levels. It has also supposedly contributed to a massive transnational influx of capital and labor (both legal and illegal) in all three countries, much to the benefit of investors and multinational corporations at the expense of the economically vulnerable.

Mercosur (Mercado Común del Sur)

The Mercado Común del Sur (Mercosur), or the Southern Common Market, is a regional trade agreement between the South American countries of Argentina, Brazil, Uruguay, and Paraguay established by the Treaty of Asunción in 1991. It was later updated by the 1994 Treaty of Ouro Preto, with cooperation agreements later extended to Chile and Bolivia. Its main purpose is to promote free trade and the fluid movement of goods, peoples, and currency within this trade bloc based on the model of the European Union.

Severe economic and political conditions in the 1980s led these South American countries, which had formerly focused most of their trade with major nations outside the region, to begin to integrate their economies regionally. The belief that external international conditions restricted Latin American economic development led many financial experts and politicians to conclude that coordinating economic efforts within a regional basis would be more suitable to domestic economic development. The Latin American Debt Crisis of the 1970s and 1980s, caused in part by

Presidents and the delegations of the Mercosur trade block participate in the XXV summit of the Mercosur, in Montevideo, Uruguay, December 16, 2003. (Adrian Sifon/Reuters/Corbis)

► THE FREE TRADE AREA OF THE AMERICAS (FTAA)

The Free Trade Area of the Americas (FTAA) was a proposed agreement to eliminate or reduce the trade barriers throughout the Americas. Formal talks regarding its establishment began with the Summit of the Americas in Miami in 1994. The FTAA first attained public attention during the Quebec City Summit of the Americas in 2001, which was targeted by massive antiglobalization protests. In negotiations held in Mexico on November 16, 2003, officials of 34 potential member nations met to discuss proposals. The proposed agreement was essentially an extension of the existing North American Free Trade Agreement (NAFTA) between Canada, Mexico, and the United States established in 1994 to include Latin American and Caribbean states. However, these talks failed to establish the FTAA, as individual states were concerned about losing economic autonomy and the possibility of expanding U.S. hegemony.

Critics of the proposed FTAA allege that it is yet another attempt by the United States to dominate the economic destinies of Latin America. The FTAA has come under fire in recent years by antiglobalization activists and critics of alleged American economic imperialism in Latin America. In 2004, Cuba, Venezuela, Bolivia, Ecuador, and Nicaragua joined together to form the Bolivarian Alternative for the Americas in protest of the U.S.-backed FTAA. The last FTAA summit was held at Mar del Plata, Argentina, in November 2005. However, no agreement on the future establishment of the FTAA has been reached, leading some critics to believe that it is essentially a dead letter.

—Abraham O. Mendoza

inadequate industrialization in these nations and economic subservience to the whims of the World Bank and the International Monetary Fund (IMF), helped provide the impetus to create Mercosur. Latin American debtor countries could either default on international loans or accept the conditions imposed by the IMF. Eventually by the 1990s, major debtors accepted the IMF's plan, which included austerity measures, cutting subsidies, opening markets to foreign competition, decreasing imports, increasing exports, and privatizing state industries. This subjection to what were perceived to be neocolonial foreign

interests made Latin American leaders believe that regional integration would create a larger market that could better support more rational industrial development and greater autonomy from external interests.

Prior to Mercosur, the first economic integration agreement between Argentina and Brazil occurred in 1985 when President Raúl Alfonsín of Argentina and President José Sarney of Brazil signed the Argentina-Brazil Integration and Economics Cooperation Program. The formal establishment of Mercosur, however, came with the Treaty of Asunción, signed in Paraguay on March 26, 1991. Argentina and Brazil are the integral nations of Mercosur because they represent approximately 90 percent of the area's population, economic output, major key industries, and exports. For the purpose of establishing an effective intrastate customs union and common market, the Mercosur signatory nations ended their tariffs and created a free-trade zone. They also established a common external tariff and began to coordinate their domestic economic plans to ensure uniformity within the trading bloc. In addition, they allowed for the unrestricted movement of investment capital, migrant labor, and services within the signatory nations. In 1994 the presidents of the four member countries met in Brazil to sign the Ouro Preto Protocol, and on January 1, 1995, Mercosur was officially inaugurated. Mercosur countries at the time were apprehensive that the United States would attempt to coerce participants into a rival continental economic zone than being planned, the Free Trade Area of the Americas (FTAA). However, U.S. president Bill Clinton gave Mercosur his blessing in 1997, allaying these fears.

Mercosur has emerged to become Latin America's most successful economic union and is currently the fourth-largest commercial bloc in the world. Mercosur encompasses an area of more than 4.5 million square miles with more than 200 million inhabitants; the combined gross domestic product of the member nations is in excess of \$2.42 trillion a year, ensuring its potential as a major economic force in the near future. While some critics, particularly within the major regional economic powers Argentina and Brazil, resent the lack of independence in economic affairs imposed by cooperation with

Mercosur, most people see it as a positive development in securing a greater degree of prosperity for Latin America.

Currently, Bolivia, Chile, Colombia, Ecuador, and Peru have associate member status with the potential of seeking full Mercosur membership in the future. Most recently, Venezuela signed a membership agreement on June 17, 2006, but prior to becoming a full member, its entry needs the ratification of the parliaments of Brazil and Paraguay. However, the Treaty of Asunción explicitly delineates democratic government as an essential condition for membership in Mercosur, which is problematic to Venezuelan admission given the alleged authoritarianism of the current regime of Hugo Chavez.

The Association of Southeast Asian Nations (ASEAN)

The Association of Southeast Asian Nations (ASEAN) is the regional alliance of the ten states of Southeast Asia that have agreed to work together to accelerate economic growth and to foster peace and security since its founding in 1967. Representing the 500 million people of Southeast Asia and having a gross domestic product of \$737 billion, ASEAN is one of the major trade associations in the world. The participation of the United States, Japan, and China in ASEAN as dialogue partners allows the organization to transcend its regional role and play a major global role as well. Given the present plans of China to create a free trade area with ASEAN, it has the potential of becoming the world's biggest free trade zone. In addition to these qualities, ASEAN likewise has diverse programs that include cultural, social, and educational benefits for its members. The headquarters is located in Jakarta, Indonesia.

➤ ASIA-PACIFIC ECONOMIC COOPERATION (APEC)

Asia-Pacific Economic Cooperation (APEC) is the preeminent economic grouping of countries from the Asia-Pacific Rim region, the nations bordering the Pacific Ocean that have committed to facilitating free trade, safe and efficient commerce, and economic and technical cooperation. These 21 Member Economies include the diverse political and economic systems of the United States, Japan, the People's Republic of China, Mexico, the Republic of China (Taiwan), the Russian Federation, Brunei Darussalam, and Vietnam, among others. APEC claims to be the only economic organization in the world that operates on a voluntary basis and not on formal agreements. The economies of this association account for 60 percent of the world's gross domestic product (GDP) and 47 percent of world trade. Furthermore, these nations that constitute the membership of APEC include one-third of the world's population. The annual meetings, which serve as the primary summits for the organization, host the heads of state of each member nation excluding Taiwan, which sends a nongovernmental representative as a concession to the political pressure exerted by the People's Republic of China. The annual meetings rotate among the member states. The headquarters of APEC is located in Singapore.

Since APEC's first meeting at Canberra, Australia, in 1989, this economic association has developed its organization and its goals, increased its membership, and experienced noteworthy obstacles. During the Bogor, Indonesia, summit in 1994, APEC announced the Bogor Goals, which projected the achievement of the goal of free trade and investment in the Asia-Pacific region by 2010. At the 1997 APEC summit in Vancouver, British Columbia, local police used pepper spray on protestors who opposed APEC for a variety of reasons. The year 1997–1998 also brought an economic crisis in the region that challenged the notions of free trade and foreign investment. In 2003 Thai police thwarted the terrorist activities of Riduan Isamuddin (aka Hambali) of Jemaah Islamiah, who planned to attack the APEC summit scheduled for 2003 in Bangkok, Thailand.

—Scott Catino

ASEAN grew from a predecessor organization called Maphilindo (an amalgamation of the names of the three participating nations: Malaysia, the Philippines, and Indonesia) to include the vibrant economies of Singapore and Thailand. On August 8, 1967, these five nations signed the ASEAN Declaration, also known as the Bangkok Declaration. Although founded originally as a bulwark against communism in Southeast Asia during the hostilities of the Vietnam War era, ASEAN transcended this limited role and later included all of the nations of Southeast Asia, including communist Vietnam. After Brunei Darussalam joined in 1984 shortly after attaining independence, the remaining states of Southeast Asia joined during the mid-1990s except Cambodia, which was admitted in 1999 after some delay because of its internal instability.

ASEAN has survived the numerous problems generated by the diverse political and religious ideologies of its members by chiefly relying upon the principle of noninterference. Democratic reformers, Muslim activists and supporters, and the threat of independence movements, particularly the independence of East Timor, all have challenged the noninterference policy but without damaging the essential unity of the organization. Some critics of the organization have argued that ASEAN has acted indecisively and has supported authoritarian regimes such as Burma and Vietnam. However, the ASEAN Regional Forum has addressed global problems such as nuclear proliferation, security problems on the Korean peninsula, and international terrorism, the latter being a major problem after the Bali nightclub attacks in 2002. ASEAN seems poised to play an increasingly diverse and important role in regional and international affairs throughout the twenty-first century.

World Trade Organization

The World Trade Organization (WTO), created in 1995, represented the culmination of a 50-year conversation about the ideals and practice of international trade. In its present form, the WTO is an international treaty organization, intended to increase the overall level of trade by lowering tariffs and abolishing restrictive, preferential, or mercantilist regulation. It is not only a venue for trade negotiation, as was its predecessor, the General Agreement on Tariffs and Trade (GATT), but contains dispute resolution and treaty enforcement powers. The WTO has its roots in the 1944 Bretton Woods conference, whose objectives (strongly supported by the United States) included a commitment to a multilateral trade system that would manage itself autonomously, independent of its members' governments. The agreement terminated the financial advantages of the British colonial order, developed over the course of the nineteenth century. Together, GATT and the WTO are a transformational achievement in economic ideology, national power, and internationalism. In 2008 the WTO had 165 member states with the aims of suppressing barriers to trade and having a common tariff policy for each and for all.

The birth of GATT followed the spectacular rise of the United States through World War II. Prior to World War II, the United States had long chafed under what it saw as a world system dominated by closed currency blocs constructed to benefit colonial powers and above them all the British Commonwealth. Financially enfeebled by the war, having little choice but to follow the United States or attempt to stay abreast, Britain enthusiastically collaborated on the making of an U.S.-inspired postwar world. The U.S. vision was the embodiment of classical economic doctrines:

that trade benefited all parties, that hindrances to trade were impediments to all, and that unrestricted trade unlocked the magic of comparative advantage (though cynics might note that the United States was best equipped to excel on these terms).

The devastated nations of Western Europe, for their part, were bankrupt and had little national advantage left to protect; any system that offered immediate aid was a lifeline that could scarcely be refused. The concurrent rise of the Soviet Union, acquiring territories in Eastern Europe and operating its own closed and distinct economic system, was further inducement to act with speed and strength. The United States also looked homeward; despite its fabulous wartime wealth, the terrifying Great Depression was only four years in memory. The United States was willing to take enormous risky steps to secure prosperity, transform trade, and reject protectionist policy on a global scale.

The initial Bretton Woods meeting of 1944 created the International Bank for Reconstruction and Development, which later became the World Bank; created the International Monetary Fund, which stabilized the world's currency system; promised U.S. subsidies; and positioned the 44 signatories for the postwar economic rebuilding. This meeting in the spring of 1944, however, did not set up an organization to encourage reciprocal trade agreements. The United States sent out invitations in 1945 to the signatories of Bretton Woods to begin this second discussion.

Two separate initiatives resulted: a working group on trades and tariffs and a U.S.-sponsored United Nations (UN) resolution to create the International Trade Organization (ITO). In 1947 the working group created the Protocol of Provisional Application of the General Agreement on Tariff and Trade that was signed by 8 of the 23 participants. This group became known as GATT 1947. The UN resolution resulted in a charter for the ITO, which ran into difficulties. The organization was meant to organize and counsel nations seeking to improve their trade portfolios, but its view was clearly supranational in scope and ran into difficulties with sovereign nations. Originally, 23 countries signed on to the ITO, but the U.S. Congress refused to ratify it, suspicious of the loss of sovereignty implied in the

➤ G-20

The G-7 finance ministers, meeting in 1999, announced a new advisory council, the Group of Twenty, or G-20. The G-20 consists of the G-7 (Canada, France, Germany, Italy, Japan, Britain, and the United States), the European Union, and 12 emerging market economies (Argentina, Australia, Brazil, China, India, Indonesia, Mexico, Russia, Saudi Arabia, South Africa, South Korea, and Turkey). Following the East Asian financial meltdown, the G-7 worried that their aura of financial infallibility was dimming and sought to enhance the stability of the Bretton Woods institutional system by establishing a larger consultative body. For its first eight years the G-20 held seemingly important meetings, released study papers, and was generally toothless. The global economic crisis of 2008 and the increased global economic heft of emerging nations, however, have brought the G-20 forward as the natural voice for the developing world. Emerging economies are calling for reform of Bretton Woods institutions and for greater voice and representation therein. The G-7, for its part, may be listening.

—*Jacqueline Swansinger*

charter. The original combined planning of the ITO, the International Monetary Fund (IMF), and the World Bank underwent some transformations as a result, and GATT survived as the vehicle for liberalizing commerce and trade.

Between 1948 and 1986 there were seven rounds of GATT negotiation to level the playing field for all traders. These discussions managed to decrease tariffs on manufactured goods from 40 percent to 5 percent during a period when world trade grew by a factor of 4 percent. In 1986 the eighth round of negotiations, called the Uruguay Round, led to the decision to form the WTO, an international agency empowered to bring the world closer to a global standard of free trade and commerce, with powers to punish and cajole national actors into following WTO stipulations. Measured solely by volume of trade, the WTO has been wildly successful: in 2006 world exports of goods and services totaled \$11.8 trillion; in the first ten years of life of the WTO, trade more than doubled. In fact, since 1950, trade has multiplied twenty-sevenfold.

According to the founding philosophies of GATT and the WTO, nationalism and national interests impede social and economic development and the progressive global movement toward liberal trade. Although free trade economists created this idealistic vision of the world, the citizens of individual nations, especially underdeveloped nations, grew less convinced and increasingly bitter about the economic changes forced upon them by agencies enamored of capital.

This antagonism surfaced in violent protests during the 1999 WTO trade talks in Seattle. In the aftermath, the Doha Round, negotiators decided to focus on the problems of developing countries and give increased consideration to three concerns: the sustainability of development, not just growth; protection of the environment; and transparency and democracy in the governance of global policy. This new conversation reflects a nascent perspective that economics is not value neutral, that profit can coexist with debt forgiveness, fair trade, and equity, or as Joseph Stiglitz has said, capitalism may occur in different flavors.

Tariffs and Dumping

Tariffs (taxes applied to goods imported into a country) and dumping (where exported goods are sold at very low prices in order to capture market share and eliminate competition in foreign markets) are both important issues that are fundamental to international trade policy. Since

the mid-nineteenth century, tariffs have steadily declined worldwide as countries have generally abided by the increasingly liberalized trade agreements of the General Agreement on Tariffs and Trade (GATT) established in 1947 and then the World Trade Organization (WTO), which replaced GATT in 1995. Tariffs act as barriers to trade by making goods more expensive to sell in foreign markets. As tariffs have fallen worldwide, the amount of international trade has correspondingly increased. Reducing tariffs promotes freer trade, which benefits society as a whole. However, individuals and firms producing goods that compete with foreign importing firms face increased competition as tariffs are reduced. This may result in reduced wages or even job loss if these domestic firms go bankrupt. If the trade is fair, however, this negative aspect of trade is more than offset by the advantages both to consumers, who receive a greater variety of goods, and to domestic firms, which will find it easier to export to foreign markets.

One situation where trade has been found to not be fair is when firms dump products on foreign markets. Like the reduction of tariffs, dumping goods has two immediate offsetting effects. The import of extremely low-priced products, possibly even at prices below the cost of the inputs used to manufacture the products, will force domestic firms to lower prices to points where they are no longer profitable. Similar to lower tariffs, this will have significant negative effects on the domestic firm that cannot compete at such low prices. The consumers of these imported goods will, at least in the short run, benefit by paying much less for the dumped goods. Opponents of dumping argue that over a longer time period, dumping will harm even the consumers when the foreign firms eliminate competition and increase prices to ever higher levels. The threat of dumping could stifle domestic firms from starting up or investing. This would also negatively affect domestic economies. Antidumping laws are therefore needed to counter what is considered unfair trade so as to ensure free and competitive international trade. In addition, without these laws political resentment would build up against free trade, which would ultimately hurt all countries. Alternatively, others argue that without subsidy from their government, firms that are

dumping cannot continue to sell products below cost. Dumping therefore provides benefits to consumers with little lasting impact on domestic firms. Regardless of which argument is correct, antidumping receives tremendous support from well-organized labor organizations and industry groups, while consumers are generally not represented.

Over the years, a number of U.S. industries have claimed to have been harmed by foreign dumping. In the steel industry, U.S. firms faced the first real wave of competition in the early 1960s. Steelmakers in Europe and Japan took advantage of technological advances to export inexpensive steel, while U.S. firms were saddled with high labor costs. By 1974 the U.S. steel industry lobbied for protection by charging the foreign firms with dumping. President Jimmy Carter was able to satisfy the steel industry by implementing a system that would automatically apply a punitive tariff if the price of imported steel was below a benchmark price. This fell apart shortly after the U.S. Steel Corporation filed a dumping suit in 1980. After the early 1980s, the U.S. steel industry was protected from foreign competition by convincing foreign countries to voluntarily restrain the amount they import to the United States. As a result of this, steel prices in the United States were up to 40 percent higher than the world market price.

In a similar case involving alleged dumping, the United States in the 1980s was able to force foreign automobile companies to agree to voluntarily restrain their exports to the United States or face imposed tariffs. The U.S. computer chip industry was another industry that faced severe competition from Japanese countries that were exporting Direct Random Access Memory (DRAM) computer chips in the mid-1980s. At the time, U.S. producers accused the firms of dumping by selling the chips below the production costs. After being threatened with punitive tariffs, the Japanese firms voluntarily agreed to production controls and price floors. When in 1988 the demand for chips brought about a worldwide shortage, the Japanese producers and the remaining U.S. producers received huge profits. Under the final round of GATT in 1994, all WTO countries agreed to phase out all voluntary export restraint agreements within four years. With

voluntary export restraints eliminated, the dumping issue is now dealt with more directly.

GATT and the WTO contain detailed provisions on the identification of dumping and the measures that may be taken to offset the damages incurred from dumping. Countries that rely heavily on export industries have taken great lengths to ensure that procedures used in calculating the export price and normal domestic prices are fair. Difficulties arise in calculating these amounts when, for example, the product is not resold in the original condition in which it was imported or if the government has controls on prices that result in the normal price in the domestic market being unsuitable for comparison. These problems also arise when trade is between countries with vastly differing economic systems, as when a market-oriented country trades with a government-controlled communist country. If dumping is found to have occurred, then the level of injury determines the size of the duty to be placed on the exporting country. Just initiating a dumping investigation is usually enough to end the practice, as importers shift to alternative sources. Usually the investigation takes a long time, which has the effect of penalizing the exporter even when no evidence of dumping is found to have occurred. Unlike other WTO provisions, there is no exception for developing nations with respect to dumping. Developing nations are frequently accused of dumping, which has adversely affected the development of their export industries.

Electronic Banking

In the late 1800s, the Western Union Telegraph Company of Rochester, New York, first offered money transfer services across the United States. More widespread applications of electronic banking, however, did not occur until the 1950s. With checking accounts growing by over 20,000 per

➤ OFFSHORE BANKS AND TAX HAVENS

Since the end of World War II, offshore banks and banks in Switzerland and Luxembourg have provided a way to escape regulation or taxation of assets by home governments for wealthy tax evaders, criminals, and terrorists. Such banks are typically located in island nations or landlocked states that provide low taxes or no taxes on deposits, absolute secrecy, little legal restrictions and regulations, and easy access to deposits and withdrawals to their clients, who mostly live in neighboring countries. Switzerland and Luxembourg in Europe and the Cayman Islands in the Caribbean region are famous for banks that provide customers with the aforementioned benefits not provided by their own state's banking systems. Many of the transactions are made electronically or through the Internet, meaning that customers never actually set foot in an offshore bank. However, offshore banking is criticized for its association with organized crime, money laundering, tax evasion, and international terrorist networks. By providing tax havens for the superrich of developed countries not wishing to pay taxes, offshore banks deprive these countries of substantial tax revenue. Furthermore, by allowing international crime syndicates and transnational terrorist organizations the use of their services, they become an integral part of their networks.

—*Abraham O. Mendoza*

month in the early 1950s, the Bank of America, the world's largest bank, desperately needed a means to automate check processing and asked the Stanford Research Institute for help. After a number of setbacks, the Stanford Research Institute invented magnetic ink character recognition (MICR) and also developed working prototypes of the equipment and computer that would use MICR for check processing. In 1956, General Electric began to commercially manufacture the first 32 electronic accounting machines for the Bank of America. These first models could read, record, and sort MICR-encoded checks at speeds approaching 3,000 checks per minute. In comparison, it took an hour for 240–250 checks to be manually posted by experienced workers. Elec-

tronic Recording Machine Accounting would transform the banking industry by standardizing the use of numbers instead of names to process checks and by providing a means to automatically read and post transactions using computers. These innovations became worldwide standards that are still in practice today.

Two other technological advances—credit cards and automatic teller machines (ATMs)—set the stage for modern electronic banking. The first bank credit card was issued in the early 1950s by Franklin National Bank, located in New York. The credit card caught on quickly, and soon banks in all major cities had credit cards that could be used at selected merchants in each city. In 1966 a number of banks formed what would become MasterCard International, which would allow one card to be used across the country and internationally. Also during the mid-1960s, the Bank of America began to license its BankAmericard to U.S. banks. By 1977, these banks formed a membership association and adopted the name VISA.

The first ATM was installed in 1971 by Seattle First National Bank. ATMs were never intended to be a means of improving efficiency or cost savings for banks but instead were intended only to provide a convenient means for customers to obtain cash and make deposits after hours. Customers liked this convenience. The popularity of ATMs grew through the 1970s, and banks stepped up installations to match or one-up their competitors. The number of ATMs grew from a few thousand in 1973 to about 60,000 in 1985 and reached 500,000 in 2005. The number of ATM transactions also grew but not as rapidly and eventually peaked at 6,500 transactions per machine per month in 1995. ATM usage has since declined as consumers have turned to the use of debit cards at the point-of-sale to obtain cash conveniently. As consumers became more familiar with the use of credit cards and ATMs, they became increasingly willing to perform traditional banking services such as borrowing, depositing, and obtaining cash outside of the traditional brick-and-mortar bank. During the 1980s and early 1990s this prompted many to forecast a cashless society where ATMs and traditional banks would be replaced by home banking over the Internet. In addition, most ATMs

today are affiliated with one of the major credit card companies so that users can obtain cash from their accounts in local currencies around the world.

Internet banking began in 1995 when Security First Network Bank (SFNB) was chartered as a fully transactional online thrift institution in Atlanta, Georgia. The first nationally chartered bank was CompuBank N.A., headquartered in Houston, Texas, in 1997. Other completely online banks have followed, such as Nexity and Telebank (which became E-Trade Bank), but into the mid-2000s their customer base has remained small. Internet banks have also been started internationally such as Dublin-based First-e, Spanish- and Argentinean-based Uno-e, and Germany-based Moneyshelf. Online banks have significant cost advantages arising from their low overhead expenses; they are therefore able to offer higher interest rates on savings accounts and lower costs for loans. Compared to brick-and-mortar banks, online banking offers the convenience of anywhere, anytime access, though it is often more difficult to obtain cash and make deposits.

Electronic banking faces many problems including high levels of credit card debt, and fraud. Privacy is also an issue that is of particular concern to electronic banking customers. Online applications require individuals to divulge private information, which customers fear can be stolen as it is transmitted. Additional privacy concerns deal with the ease with which personal information can be shared with affiliated companies or third parties. This can lead to individualized Internet marketing.

For the foreseeable future, traditional brick-and-mortar banking will continue. Instead of replacing traditional banks, electronic banking will continue to evolve to better meet the needs of customers, and the distinctions between brick-and-mortar banking and electronic banking will blur.

Online Trading

Computers have made it possible for traders and investors to buy or sell securities, or shares of stock, through an Internet brokerage account. This historical development has made national and global trading markets available almost instantaneously day and night around the world. To engage in online trading, an investor or trader must have an account that is accessible to online direct trading. Instead of calling a traditional brokerage house that has access to a representative on the floor of, say, the New York Stock Exchange, the online trader executes a trade for her or his individual account(s) through Internet access to a trader on the floor of the stock exchange (or other market). This means that computers have greatly expanded the direct access of individuals in remote areas to stock or securities markets.

Online trading began in the United States in the mid-1990s and grew rapidly, reaching over 3 million accounts by 1997. Although the rate of growth slowed as the stock market fell in the early 2000s, by 2005 there were over 40 million accounts trading online. Along with the improving stock market, online trading also grew because of the increased adoption of household Internet connectivity, specifically the growth of high-speed or broadband connections. Online investors in the United States tend to be wealthy, male, and infrequent traders. According to Magali Rheault of Kiplinger's Personal Finance, in 2004 the average size of an online investor's portfolio was \$189,000, the average household income was \$93,000, and the typical investor made 30 trades a year.

Similar to the United States, online trading has also increased in other industrialized nations. According to Forrester Research, relatively few Europeans have online accounts, but the characteristics of these traders are very similar to those in the United States. In addition, the number of accounts is anticipated to grow significantly

over time. Currently, there are 3.5 million online trading accounts in Europe, but Forrester Research forecasts that by 2011 French traders will number 1.2 million, UK traders will grow to 1.1 million, and Germany will have 2.3 million online traders.

The convenience and low cost of trading have resulted in an increase in the frequency of trading in general and an increase in day trading. Day trading is a strategy whereby an individual buys and sells stock typically on margin to take advantage of rapid changes in the price of stocks, with the hope of making quick profits. Day trading first gained popularity in the stock market boom of the late 1990s when the share prices of many companies were increasing at rates of over 100 percent per year and the stock market in general was going up at double-digit annual rates. At the time, day trading's popularity grew along with stories of small investors

who bought into IPOs (initial public offerings) of small Internet companies and were able to make thousands of dollars overnight by trading online. After the swift decline of the stock market in the early 2000s, the popularity of day trading diminished, and research was published suggesting that online trading was highly time consuming, risky, and rarely profitable.

■ Introduction: Labor

The accelerated pace of globalization has been the most significant factor affecting labor in the postwar period. The spread of new transportation and communication technologies has increased the pace of globalization. At the same time, both Russia (the former communist Soviet Union) and the still nominally communist yet functionally capitalist People's Republic of China have shifted their economies to accept the primacy of free market forces. Following Immanuel Wallerstein's World-Systems theory, these enormous political and technological changes have brought more regions of the world into the dynamic of the capitalist world system, creating new bourgeois core regions (developed nations) and new proletariat peripheries (the developing world) dedicated to manufacture. As developed nations de-industrialize and shift toward a service economy, manufacture is outsourced across multiple national borders to countries with less expensive labor pools and weaker labor regulations.

Sweatshop or near-sweatshop conditions that include long working hours, inadequate job

safety, and subsistence pay are typical in these new factory zones. At the same time, the developed nations' economies have shifted from a base in production to one catering to consumption. As such, women and formerly marginalized groups have been encouraged to join the job market to maintain consumer lifestyles with high living standards. In addition, in developing nations young people are often trained for careers that involve computer and communications technology, while others are trained not for manufacture jobs but for jobs in the service industries. In both arenas, management strategies maintain a pool of low-salaried workers, whether white-collar or blue-collar workers delegated to so-called McJobs. Globalization has also encouraged global labor migrations to fill the unskilled labor sector in developed nations and in manufacture.

Labor unions, which had grown in strength through the 1960s, became weakened in the 1970s when an economic recession led to the primacy of the policies that deregulated industries, eroding the manufacturing base, and encouraged outsourcing. Yet unions remain a

potent force as representatives seek to organize jobs in the developing world and in the service industries in the developed world.

—Fred Nadis

Gender Integration and Global Labor since 1945

The increased industrial production of the World War II era was a turning point for the employment of women in the United States as well as in Great Britain and Australia. Gearing up for the war effort helped to revive the economy and end the Great Depression of the 1930s, creating thousands of new defense-related industry jobs, many of which were filled by women. With brothers and husbands serving in the military, the female labor force in the United States expanded by more than 6.5 million women in the early 1940s, an increase of 46 percent from levels prior to U.S. entry into the war. However, by

February 1946 with World War II's conclusion and the reentry of men into the labor force, 4.6 million women exited paid employment.

In spite of this temporary decrease in women's labor force participation, female employment rates soared in the second half of the twentieth century, rising from 16.5 million in 1950 to 65.9 million in 2000, a labor force participation rate (LFPR) of 60.3 percent of all women of working age. In comparison, worldwide female employment in 2003 was 1.208 billion for a global LFPR of 53.9 percent. Although these rates differed widely throughout the world's countries and regions, even among advanced industrialized countries, no consistent pattern existed with regard to female LFPRs due to economic, political, and cultural factors. For example, women's employment rates in Sweden were similar to those in the United States, while in Japan, Germany, and Italy far fewer women work for wages outside the home.

MALE AND FEMALE LABOR FORCE PARTICIPATION RATES (%) AND THE GENDER GAP IN ECONOMICALLY ACTIVE FEMALES PER 100 MALES, 2003

	Male LFPR (%)	Female LFPR (%)	Gender Gap: Economically Active Females per 100 Males
World	79.4	53.9	68
Middle East and North Africa	76.8	28.2	36
South Asia	81.1	37.4	44
Latin America and the Caribbean	80.5	49.2	64
Industrialized Economies	70.3	50.5	76
Transition Economies	65.7	53.1	91
South-East Asia	82.9	60.5	75
Sub-Saharan Africa	85.3	63.2	77
East Asia	85.1	73.1	83

The Labor Force Participation Rate (LFPR) measures the ratio between the total number of a

group that are employed to the number in that group who are of employment age. Globally in 2003, only 68 women were in the labor force for every 100 men. The disparity was the largest in the Middle East and North Africa (with 36 economically active women for every 100 men) and in South Asia (with 44 active women per 100 men). In addition, these two geographical areas had the LFPRs with only about 1 in 3 working-age women either employed or seeking employment, with LFPRs of 28.2 percent and 37.4 percent, respectively. These low rates are probably due to the traditional role forced on women in many of these regions' economies. On the other hand, East Asia experienced the highest LFPR and exhibited a slight gender disparity between the LFPRs of males and females, with 83 economically active women in the labor force per 100 men.

Bibliography

ILO, Global Employment Trends Model, 2003; see also ILO, *Global Employment Trends 2004*, Technical note.

This dramatic influx of women in workplaces in the United States was due to a number of factors. These include the need to supplement family income, changing marital patterns, higher divorce rates, increased educational opportunities, the end of the family wage and the decline of real wages, and the implementation of equal employment legislation.

Prior to the mid-twentieth century, in the United States there had been a slow and steady increase in the LFPRs of married women, but in the decades after 1950, this trickle became an astonishing surge. Many black married women in their twenties and thirties with young children joined the labor force immediately after World War II seeking to supplement their family income; by 1970, more than one half of all black married women in their prime adult years were employed, with two-thirds holding full-time positions. Older lower middle-class white women with grown children who had devoted their lives to housework entered the workforce in increasing numbers during the 1950s due to their families' need for additional income. In the late 1960s, white married women in their mid-thirties also joined the labor force. These middle-class college-educated women were motivated less by the need to supplement family income than by occupying their time upon the end of their childrearing duties. Thus, by 1980 the majority of married and single women were employed, many of them full-time.

With more women entering the workforce after World War II, marriage became less valued for reasons of economic necessity but more esteemed as an institution for fulfilling the partners' emotional and sexual needs. With marital separation rates doubling between 1964 and 1975 in the United States combined with divorce law changes, women whose marriages had ended no longer could depend on their ex-husbands for financial support. This trend pushed even more women into the labor force, as once-married full-time homemakers were now required to provide for themselves and their children.

Although divorce laws eventually became liberalized in West European countries, this happened later than in the United States. Divorce rates did increase in European nations throughout the 1970s, although they remained much

higher in the United States than, for example, in the United Kingdom, Sweden, Germany, France, Spain, and Italy. As such, the acceleration of divorces in Western Europe had little effect on increasing women's LFPRs.

With men's real wages eroding by 1973 combined with the significant loss of well-paying factory jobs by 1975, young married women with a high school education and even those raising small children surged into the labor force to bolster the unraveling of what has been called the family wage that had allowed a single male worker to support a family. Downward pressure on men's wages in the West European industrial democracies was less severe than in the United States in the early to mid-1970s because of these nations' stronger labor unions. In addition, in these countries extensive welfare state measures provided much more protection for families, regardless of the employment situation of family members.

Legislative reform was another factor that led to dramatic increases in the LFPRs of women after the end of World War II. Around the turn of the twentieth century, the passage of laws and the use of the marriage bar, the pervasive tradition of disallowing married women to obtain paid employment, restricted women's opportunities in the nascent industrial economy. However, with 20 million new jobs generated after World War II in the United States, these restrictive laws and the marriage bar began to be dismantled as employers viewed the employment of married women in a much more positive light.

Furthermore, the passage of landmark equal employment legislation in the early 1960s in the United States contributed to more women seeking jobs. The 1963 Equal Pay Act, which mandated that men and women who performed substantially similar work should be paid the same, led to an increase in women's wages, although collectively they still earned substantially less than their male counterparts. Additionally, Title VII of the 1964 Civil Rights Act, which outlawed employment discrimination based on race, color, religion, national origin, and sex, helped women gain access to jobs that had been unavailable to them in the past.

By the late 1990s, women in the United States held 60 percent of the 65 million jobs generated

since the 1960s and were predicted to comprise two-thirds of new employees in the first decade of the twenty-first century. By 2000, more than two-fifths of medical, law, and doctoral degrees in the United States were earned by women, increasing their numbers in the academic, business, medical, and legal professions. Although many women with a high school education or less are still concentrated in low-paying service industries, one can expect to see more women obtaining highly skilled positions in the early decades of the twenty-first century.

Labor Unions since 1945

There has been enormous regional diversity in the character and density of labor unions since 1945. Unions have acted as mutual aid societies, as bargaining agents with employers, and as political lobbyists. Influenced by economic and political factors at the national and global levels, in general unions saw growing membership and influence in the three decades after World War II, but more recently union membership in industrially developed countries has declined, while developing countries have seen the most union growth.

Post-World War II economic growth led to a dramatic increase in the membership and influence of unions. In many Western countries, employers came to accept the role of unions in collective bargaining systems, and governments consulted with unions on economic policy and passed laws that were favorable to union growth. In the communist countries, unions had no real

➤ CHANGE IN TRADE UNION DENSITY

The International Labour Organization's 1997–1998 report "Industrial Relations, Democracy, and Social Stability" tracked union membership density, that is, the ratio of union affiliated workers to the total number of workers between 1985 and 1995. In general, the trend was down. South Africa and Zimbabwe showed a high increase in union membership in Africa. In the Americas only Chile showed a significant increase in membership, whereas other countries, such as Argentina, Costa Rica, and Venezuela, showed significant declines, as did the United States. In Asia also the trend was decline except in Hong Kong and the Philippines. Australia and New Zealand also showed a significant decline, as did most of Europe, particularly Eastern Europe where union membership often had been mandatory prior to the collapse of the Soviet Union. Spain alone showed significant increases. Overall, these statistics confirm that this was a period of decline in union membership, often a result of Reagan- and Thatcher-inspired government deregulation policies as well as a deterioration of the industrial base in developed countries.

—Victor Devinez

independence from the government but existed to help attain higher production levels. Independent unions, most notably Solidarity founded in Poland in 1980, faced government repression. Powerful unions in Latin America helped achieve political changes, and unions in Africa and Asia played a role in successful independence struggles.

Economic and political changes in the 1970s led to the decline in union strength in the industrially developed world. Growing unemployment and the shift from the highly unionized manufacturing and public sectors to the less-unionized service sector has diminished union power. In the 1980s and 1990s, governments and employers in places such as Australia, Britain, and New Zealand sought to regulate union behavior and diminish the ability of unions to strike and bargain. As a result, labor unions have less influence in national politics and in collective bargaining, and union membership has declined.

However, wide variations in union strength in Western countries exist. In the United States, unions have steadily declined from 33 percent of the workforce in the mid-1950s to 13 percent in 2000. Canada's union density remained stable at about 38 percent between 1980 and 1994 due to a more politically friendly environment. Britain had a Conservative government that introduced a whole host of antiunion legislation in the 1980s, and this plus a marked decline in the manufacturing industry led to a fall in union membership from 55 percent of the workforce in 1979 to less than a third by the end of the century. In contrast, Scandinavian countries have been especially successful in maintaining the largest unions in Europe.

The end of the Cold War ushered in a new era in trade unionism in previously authoritarian countries. Communist countries of Eastern and Central Europe such as the Czech Republic, Poland, and Hungary saw a drop in union membership, which can be attributed to the ending of government-sponsored unions. In Africa and Asia, unions grew in strength as these areas industrialized and repressive regimes ended. South African unionization rates rose 130 percent and Thailand's unionization rates rose 77 percent between 1985 and 1995. In many Middle Eastern countries and in places such as Colombia, however, union members still faced imprisonment and even death from employers and governments.

Even though union strength has declined across the world, unions have adapted to new circumstances. To enhance organizational strength and to expand their jurisdictions, unions have increasingly turned to mergers. Transnational union cooperation has emerged in some sectors of the economy, such as dock workers and automobile manufacture, and in individual multinational corporations, such as General Motors and the Electrolux Group. Unions have increasingly embraced a female workforce in the service and white-collar occupations, and this has further changed the complexion of trade unions.

U.S. Labor Unions, Postindustrial Era

At the time of the merger of the American Federation of Labor (AFL) and the Congress of Industrial Organizations (CIO) in 1955, union density in the United States had reached its peak of 35 percent, meaning that more than one out of three eligible workers were union members. Union strength predominated in blue-collar jobs in such industries as manufacturing, mining, construction, and the railroad, while union density was substantially lower among white-collar workers and government employees. Although the economy was still considered to be industrially based during the middle of the twentieth century, by the late 1950s service sector jobs slightly outnumbered manufacturing jobs for the first time in U.S. history.

Despite the gradual elimination of unionized manufacturing jobs through plant shutdowns, the movement of factories to the right-to-work states located predominantly in the southern United States, and outsourcing to other nations throughout the 1960s and the 1970s, industrial unions such as the United Auto Workers (UAW) and the United Steel Workers of America (USWA) remained the leading labor organizations in the U.S. trade union movement. In fact, in 1979 just a couple of years before the onset of the 1981–1982 economic recession and the shakeout in U.S. industry, the UAW's membership reached its apex of 1.5 million members.

With the continued loss of unionized factory jobs in the 1980s and the concomitant growth in service sector jobs, industrial unionism began to be replaced with a postindustrial unionism based on the unionization of government employees, many who could be classified as white-collar workers. Beginning in 1962, U.S. government employees obtained the legal right to organize with the issuance of President John F. Kennedy's

Executive Order 10988. In addition, during this same period states began to pass laws allowing public sector workers the right to organize and to collectively bargain with municipal and state administrations and agencies. Wisconsin was the first state to pass such a law in 1959. This trend continued from the 1960s through the 1980s, dramatically increasing public sector union density. This impressive rise in public sector unionism led to the substantial growth of the American Federation of State, County and Municipal Employees (AFSCME) among city and state employees as well as the National Education Association (NEA) and the American Federation of Teachers (AFT) among public primary and secondary school teachers. By 2006 overall union density in the United States registered at 12.5 percent, with union density in the private sector having plummeted to 7.4 percent, while public sector union density was nearly five times higher (36.8 percent).

Besides the proliferation of public sector union membership, some unions committed to organizing in service industries also experienced growth, while industrial union membership continued to decline. For example, beginning in the late 1980s the Service Employees International Union (SEIU) devoted much of its resources to organizing with the launching of its Justice for Janitors campaigns. By 2007 the SEIU was one of the largest unions in the United States. In order to adapt to the realities of a postindustrial economy, industrial unions such as the UAW and the USWA began to organize workers outside of their traditional manufacturing and related jurisdictions, expanding into a wide range of service industries.

In the summer of 2005 the crisis of post-industrial unionism in the private sector resulted in the exodus of a number of large unions from the AFL-CIO. Arguing that the decline in private sector union density was alarming and that the federation was not doing enough to encourage its affiliated unions to spend more of their resources in organizing workers, these unions established the rival Change to Win Federation (CWF) at the end of September 2005 in an attempt to reinvigorate private sector unionism.

With manufacturing constituting only 11 percent of jobs in the U.S. economy by 2007, it be-

➤ THE ORIGINS OF THE CHANGE TO WIN FEDERATION

The Change to Win Federation (CWF) of labor unions emerged from the New Unity Partnership (NUP), formed over the July 4 holiday in 2003 when five national union presidents, four of whom represented AFL-CIO member unions, assembled to discuss the dramatic deterioration of unions and the decades-long slide in union density. From this and subsequent meetings, these presidents devised a strategy to boost union membership by drastically reorganizing the labor movement. Five unions—the Service Employees International Union (SEIU), the Hotel Employees and Restaurant Employees (HERE), the Laborers International Union of North America (LIUNA), the United Brotherhood of Carpenters (UBC), and the Union of Needle Trades, Industrial, and Textile Employees (UNITE)—agreed to combine their resources in cooperative union-organizing campaigns while calling for the AFL-CIO's 57 affiliates to be merged into 15 or 20 larger industrial unions.

Although the NUP formally broke up in January 2005, on June 14, 2005, the SEIU, UNITE HERE (the merger of UNITE and HERE), the Laborers, the Teamsters, and the United Food and Commercial Workers (UFCW) created the CWF to promote joint union-organizing drives to revitalize the American labor movement. In late September 2005, the five above-mentioned labor organizations along with the UBC and the United Farm Workers, representing 5.4 million members, officially inaugurated the CWF, promising to unionize hundreds of thousands of workers. The CWF stated that it was committed to devoting 75 percent of the federation's budget to organizing 50 million landlocked service industry workers such as cashiers, janitors, nurses' aides, security guards, and retail employees. Major companies that the CWF expressed interest in organizing included Wal-Mart, Home Depot, and FedEx.

—Victor G. Devinatz

came essential that unions target a wide variety of industries that had been barely touched by unionization in order to continue to provide vital protection for U.S. workers in the early decades of the twenty-first century. Many organizers recognized that for postindustrial unionism to be successful, labor organizations would have to focus their recruiting efforts on women,

Grocery store workers, members of the United Food and Commercial Workers Union, strike in California in 2004. The strike was in response to proposed cuts in health care and pension benefits. (Los Angeles County Federation of Labor, AFL-CIO)

immigrants, and minority groups rather than continuing to emphasize the organizing of white male employees as they had done throughout most of the twentieth century. The continuing industrial and occupational transformation of the U.S. economy also indicated that unions must target not only college-educated white-collar employees but also different types of contingent workers and workfare workers as well as traditional blue-collar employees.

Modern Slavery

Under Article 4 of the United Nation's Universal Declaration of Human Rights, "No one shall be

held in slavery or servitude; slavery and the slave trade shall be prohibited in all their forms." Slavery nevertheless continues to exist in most parts of the world, although it is illegal under both national and international law, including the 1956 United Nations Supplementary Convention on the Abolition of Slavery, the Slave Trade and Institutions and Practices Similar to Slavery. The 2002 Rome Statute of the International Criminal Court, moreover, characterizes enslavement as a crime against humanity falling within the jurisdiction of the Court. While the term "slavery" denotes an economic system in which someone, who is the property of another person, provides labor for that person without payment, in modern times the term has come to include labor relations such as bonded labor, forced labor, and forced marriage.

Modern slavery takes several forms and includes labor relations that are not normally associated with transatlantic slavery. As defined by Anti-Slavery International, a slave is (1) forced to work through mental or physical threat; (2) owned or controlled by an employer, usually through mental or physical abuse or threatened abuse; (3) dehumanized, treated as a commodity, or bought and sold as property; and (4) physically constrained or has restrictions placed on his or her freedom of movement.

Estimates vary as to the scale of modern slavery and the modern slave trade, also known as people trafficking. The United Nations estimated in 2005 that there were 27 million enslaved persons worldwide, while according to U.S. State Department figures (2005), 600,000–800,000 people are trafficked internationally each year (including 14,500–17,500 into the United States, 80 percent of whom are women and children). Modern slaves work in a wide range of industries and countries across the world, such as in the cotton and silk industries in India, agriculture (especially cocoa) in West Africa, mining in Peru, domestic service in the Philippines, and the sex industry in the United States. Filipino and Thai women are trafficked to Japan and Australia, Iraqi women to other Arab countries, and East European women to the United Kingdom and the United States. Children are also forcibly recruited into military service in countries such as Sudan.

There are no reliable statistics for the prices of slaves, but as of 2005 these have been estimated, in U.S. dollars, as between \$50 and \$100 in Sudan and \$1,000 and \$6,000 in Eastern Europe. The price of a slave is hence considered a small capital outlay in a relatively low-risk high-profit endeavor. After illegal drug sales and arms trafficking, human trafficking is today the third most profitable criminal activity in the world, generating \$60 billion annually. The worldwide sex industry, for example, is estimated to net an annual profit of \$6 billion from slave labor according to the American Anti-Slavery Group.

Recent legal measures to tackle the problem of modern slavery include the Victims of Trafficking and Violence Protection Act, which was passed by the U.S. Congress in 2000, while slavery was finally criminalized in Niger in 2003. Organizations and charities campaigning against modern slavery include the United Nations (including its International Labour Organisation); Anti-Slavery International (formerly the British and Foreign Anti-Slavery Society, founded in Britain in 1839); its sister organization in the United States, Free the Slaves; and the American Anti-Slavery Group.

Because people in economically depressed and politically unstable countries are especially prone to becoming victims of slavery and trafficking, economic and social development is seen as the key to abolishing the root causes of modern slavery.

Sweatshops

The term “sweatshop” originated between 1830 and 1850 to describe a particular kind of workplace consisting of up to 100 workers where a

IDENTIFYING MODERN SLAVERY

As described in the Anti-Slavery International Web site, several common forms of modern slavery are:

Bonded labor, in which individuals accept or are tricked into taking a loan, but to repay that debt bonded laborers are forced to work long hours, for which they receive basic food and shelter as payment but may never pay off the loan, which can be passed down for generations.

Forced labor, which affects people who are illegally recruited by individuals, governments, or political parties and forced to work, usually under threat of violence or other penalties.

Slavery by descent, in which people are either born into a slave class or are from a group that society views as suited to being used as slave labor.

Early and forced marriage, which affects women and girls who are married without choice and are forced into lives of servitude, often accompanied by physical violence.

People trafficking, defined as involving the transport and/or trade of people—women, children, and men—from one area to another for the purpose of forcing them into slavery conditions.

—Alexander Hugo Schulenburg

middleman, known as the sweater, managed workers in the manufacturing of garments or clothing under grueling working conditions. Serving as a subcontractor, the sweater paid workers on a piece rate basis for each garment produced, often employing women and children in order to pay the lowest wages possible. By the turn of the twentieth century, the sweatshop was omnipresent in the garment and other industries, particularly in Britain and the United States.

With the aid of union organizing, sweatshops in the United States were supposedly eliminated by 1940. Nevertheless, by the 1950s, the sweatshop had returned. This can be explained as a result of minority groups such as Puerto Ricans and African Americans entering the garment industry in increasing numbers, later to be followed by Chinese, Korean, and other Southeast Asian immigrants. At the same time, the easing of restrictions on the industry exerted downward

► CHILD LABOR IN THE UNITED STATES

It was not until the onset of industrialization that child labor came to be viewed as socially unacceptable in the United States. According to the U.S. Census, at the start of the twentieth century 1.75 million 10–14 year olds were employed, or 22 percent of all children in this age group. By 1938, when the first lasting federal child labor law, the Fair Labor Standards Act, was implemented in the United States, child labor for the most part had been successfully eradicated from the country's mines, mills, and factories. Nevertheless, the persistence of legal and illegal child labor in certain industries still remains a problem in the United States in the early twenty-first century.

For example, in commercial agriculture, Human Rights Watch reports that children as young as 8 and 9 years old regularly labor in the industry. Of the 14–17 year olds who work as seasonal or migrant farmworkers (of which 85 percent are Hispanic), only 47 percent are enrolled in school at grade level, and 37 percent have dropped out of school altogether. In the construction industry, young workers are twice as likely to experience an occupational fatality as adult workers and 7.5 times as likely as young workers in other industries. Furthermore, in studies performed in the late 1980s and early 1990s, the General Accounting Office determined that more than half of the country's garment shops could be classified as sweatshops that illegally employed hundreds of child workers.

Finally, child labor has been frequently used in scams where young workers are recruited from central city neighborhoods to sell items such as magazines, candy, and cookies allegedly for charity. In a similar vein, young workers who sell magazines or other items as part of traveling sales crews have experienced intolerable working conditions from which many find it difficult to escape. However, undoubtedly the worst and most dangerous and abusive form of child labor involves child prostitution with an estimated 300,000 children, some entering the industry as young as 9 years old but most by age 14, working in the early twenty-first century in the United States as prostitutes controlled by adult handlers.

—Victor Devinatz

pressure on wages. The return of sweatshops in the United States also was accompanied by the rise of sweatshop factories in other nations, such as Mexico, Honduras, El Salvador, the Dominican Republic, Thailand, Indonesia, Taiwan, and South Korea, as the clothing industry globalized in the late twentieth century.

In 1994, a report issued by the U.S. government stated that thousands of sweatshops existed in the United States based on a redefinition of the term to include any employer that had violated more than one federal or state labor law regulating minimum wages, overtime work, child labor, industrial homework, occupational safety and health, or workers' compensation. Manufacturing industries that are subjected to intense global competition in the early twenty-first century, such as garments and electronics, are more likely to spawn sweatshops in developed nations to compete with manufacturing in nations with lower labor costs.

If there were any popular beliefs that working conditions in sweatshops during the 1990s were somehow qualitatively better than those found at the turn of the twentieth century, these were dispelled with the sweatshop raid on a garment factory located in an apartment complex in El Monte, California, in early August 1995. Authorities discovered more than 70 Thai workers, composed of mostly women and a few men, sewing on designer labels for top-end mass-produced clothing for an average of 84 hours per week and earning hourly wages ranging between \$.60 and \$2.00. Furthermore, the workers were guarded at all times, and they were warned that they would be killed if they tried to escape.

Working conditions in Mexico's border factories, or *maquiladoras*, appear to be representative of typical sweatshop conditions found in the global apparel industry. Workers earn between \$25 and \$50 for a 48-hour workweek (1998 figures), with unpaid overtime often required to meet the factories' quotas. This forced overtime occasionally includes working all night, with plant guards preventing workers from leaving the factories for the duration of their shifts. In these often windowless plants contained within towering walls and bolted gates, children as young as 13 labor at the same jobs as adults under unsafe and dangerous working conditions.

The return of the sweatshop has resulted in the growth of an antisweatshop movement in the twenty-first century that fights to improve the condition of sweatshop workers both in the United States and abroad. The movement includes the United Students Against Sweatshops, trade unions, and consumer groups. Its members argue that the outsourcing and subcontracting in manufacturing, due to neoliberal globalization, has encouraged the continued existence of sweatshops in this country and throughout the world. Such activists have been able to exert a negative economic impact on transnational corporations by damaging their public images through the exposure of intolerable working conditions in factories that manufacture their products in global locations. Antisweatshop activists also have called for, with some success, the monitoring of factories worldwide. For example, the continuing scrutinizing of production facilities by the anti-sweatshop movement has led in the past decade to union victories and the amelioration of intolerable working conditions in the Kukdong factory in Puebla, Mexico, and the BJ + B factory in Villa Alta Graica, Dominican Republic. Nevertheless, it is clear that the fight for labor rights in sweatshops in the developing world is intricately connected with the struggle to eliminate sweatshops in developed nations.

Industrial Safety and Labor, 1945–Present

Within the past century, industrial safety has improved dramatically in all advanced industrialized

countries as measured by the quantity of injuries or fatalities that annually occur to a group of workers. This dramatic reduction in workplace injuries and fatalities can be partially explained through the transformation of these nations from a manufacturing-based to a service-based economy with an increase in relatively safer jobs in the retail trade and service industries. Nevertheless, even dangerous occupations in the early twenty-first century were much safer than the same jobs a century before. For example, in mining in 2000, 9 miners died on the job for every 100,000 miners employed in the United States; in 1900, the annual fatality rate was 300 miners for each 100,000 miners. In developing nations, however, work-related illnesses, injuries, and deaths have remained at far higher levels.

Throughout the twentieth century workplace safety improved in developed nations despite some decline in the World War II production industries. After the war the newly formed industrial unions of the Congress of Industrial Organizations as well as a number of the older craft-oriented American Federation of Labor unions exerted an extremely important role in monitoring and enforcing workplace safety in the United States. Although labor leaders remained concerned with longer-term health hazards such as worker exposure to toxins, industrial hygienists emphasized plant safety problems throughout much of the 1950s. West European labor organizations took similar positions concerning industrial safety during this time period.

In the 1960s, complementing the social activism at large, many union leaders in the United States advocated that workers be fully protected on the job and as citizens in their communities. One effect of this workplace health and safety activism was the passage of three laws in 1969 and 1970. The U.S. Congress implemented the Mine Safety and Health Act in 1969, which not only improved the miners' health and safety at work but provided financial and medical support to miners who acquired diseases, such as Black Lung, on the job. The passage of the Occupational Safety and Health Act in 1970 led to the formation of the Occupational Safety and Health Administration (OSHA) and the National Institute of Occupational Safety and Health (NIOSH). OSHA was responsible for enforcing health and

PERCENT OF NONFATAL WORKPLACE INJURIES BY SELECTED INDUSTRY SECTOR, 2002 AND 2005

Percent of Nonfatal Workplace Injuries, 2002

Percent of Nonfatal Workplace Injuries, 2005

Sources: Bureau of Labor Statistics, U.S. Department of Labor (December 2003); Bureau of Labor Statistics, U.S. Department of Labor (October 2006).

In 2002, there were 4,406,100 nonfatal injuries in private industry compared with 3,971,700 nonfatal injuries in private industry in 2005. A little over 75 percent of all reported occupational injuries in 2002 occurred in services, trade, and manufacturing combined. In 2005, 51 percent of all reported occupational injuries occurred in manufacturing, health care and social assistance, and retail trade combined.

—Victor Devinatz

safety standards in the workplace, while NIOSH's major function was determining the appropriate levels of contact with industrial toxins. Additionally, in 1970 Congress adopted the Environmental Protection Act, establishing the Environmental Protection Agency (EPA), whose major focus was the lowering of risks to communities from exposure to pollution.

Laws and government agencies responsible for enforcing such legislation similar to those found in the United States were established in other advanced industrial democracies during this era. For example, in the United Kingdom in 1974 the Health and Safety at Work Act was passed, mandating that health and safety legislation be drafted and implemented by the Health and Safety Executive and local officials. In Canada, the Canadian Centre for Occupational Health and Safety, a government of Canada agency, was formed in 1978 by an act of Parliament in order to encourage safe and healthy work sites by eliminating injuries and illnesses at work. Such legislation has undoubtedly led to decreased death rates on the job; in the United States, 4.3 fatalities per 100,000 employees occurred in 2000 compared with 2.5 fatalities per 100,000 employees for the 15 European Union nations in 2003.

Safety standards are not as secure in the developing world. Early in the twenty-first century, approximately 1.1 million people died worldwide from workplace injuries and diseases each year, while 250 million accidents occur at work annually. The World Health Organization (WHO) estimates that only 5–10 percent of workers in developing countries have access to satisfactory occupational health services. Furthermore, WHO calculates that 50–70 percent of the workforce in developing countries might confront arduous physical workloads or ergonomically insufficient working conditions resulting in musculoskeletal injuries. In addition, up to 80 percent of workers in developing countries must regularly deal with physical dangers such as noise, radiation, pesticide poisoning, and extreme heat at their work sites. A final problem involves the systematic underreporting of workplace injuries and diseases. In Latin American countries, for example, WHO states that merely 1–4 percent of occupational diseases are actually reported. Such statistics combined with the decline of union strength

in virtually every nation indicate that industrial safety is still a major concern, especially in developing countries, in the first decade of the twenty-first century.

Age of Outsourcing

Outsourcing is the contracting out of aspects of a company's business to an outside firm. While often associated with globalization, outsourcing existed in some form before 1945. For example, throughout the twentieth century large companies in the United States often used fully owned subsidiaries to produce nonessential components for its products. The services outsourced gradually expanded to include essential functions being contracted out to independent businesses; this is especially true in manufacturing. Of course, outsourcing is not just U.S.-based. Companies in countries around the world outsource; this is especially true in Europe and Japan. While outsourcing may be positive to companies, for employees in these companies outsourcing is not as beneficial.

Outsourcing developed in the 1950s as businesses began to become more diversified. Initially, much of the manufacturing process could be handled in-house. However, beginning in the 1970s and with the onset of rapid globalization, companies began to find it difficult to be the best at everything. This led them to focus on their core goals while embracing the idea that

➤ OUTSOURCING AND THE DECLINE OF ORGANIZED LABOR

Throughout the developed world the number of workers belonging to unions has declined dramatically in recent decades. During the same time period the number of jobs being outsourced has been unprecedented. In the United States the number of jobs being outsourced rose from 6.5 million in 1983 to 10 million in 2000. During this same period union membership declined from 20.1 percent to 13.5 percent.

Unionized jobs are often targeted for outsourcing because generally they are higher-paying jobs, with employees receiving better working conditions than their nonunionized counterparts. Thus, as organized labor lost strength, it was unable to stop the outsourcing of union jobs. As a result union members suffered disproportionately due to the loss of jobs offshore.

—Michael Schiavone

nonessential functions could be fanned out. There was a dramatic increase in outsourcing during the 1980s and 1990s, with nonessential and essential aspects being contracted out. For example, half of all U.S. firms not outsourcing in 1987 were doing so by 1991, while only 58 percent of firms were outsourcing in 1992 and 86 percent were doing so by 1995.

However, it is wrong to assume that the majority of companies outsource the greater part of their functions. For example, in 2000 the largest 100 U.S. transnational companies (TNCs) had the majority of their employment locally (61.4 percent of total employment). The Transnationality Index (which is calculated as the average of the following three ratios: foreign assets to total assets, foreign sales to total sales, and foreign employment to total employment) of American TNCs is 48.2. In other words, even the largest TNCs in the United States, based on foreign assets, still have the majority of their assets, sales, and employment in the United States.

It is not just companies in developed countries that outsource; there also is an increasing trend for companies in developing countries to

do so. Initially, countries such as Japan and South Korea were favored destinations of Western companies for outsourcing. However, as these countries gained economic power and wages rose, Western companies moved production facilities to other periphery countries. What also happened was that as local companies expanded, they also outsourced. For example, since the opening of its economy, China has been the preferred outsourcing destination of Western companies. However, with increasing wages and with the Chinese government being less willing to provide tax breaks for foreign investors, there has been a move away from China. Moreover, Chinese companies are also outsourcing to such countries as Vietnam due to rising wages at home; wages are 30 percent higher in the Pearl River Delta in China than in North Vietnam. Chinese investment in Vietnam increased from \$66 million in 2005 to \$312 million in 2006.

Job loss, particularly in manufacturing, is the major controversy surrounding outsourcing in developed nations. A company can make substantial savings by outsourcing; while this benefits the company, the biggest losers are former employees who have lost their jobs. In addition, remaining employees often accept a decline in wages and working conditions in the hope that their jobs will not be outsourced. In the end, outsourcing places profits over people.

■ Introduction: Oil Economics

The modern industrial global economy has been built upon the availability of cheap petroleum supplies. The years following 2000 have called into question the status of oil, with many arguing that supplies would soon be exhausted. More strictly speaking, the modern industrial economy will continue to exist if it can be supplied with cheap energy supplies as it has been with cheap oil supplies until recently.

Petroleum was used as pitch or for other purposes from very early in human history. Until the first oil well was successfully drilled at Titusville, Pennsylvania, in 1859, oil had been gathered by hand or with simple tools. The gusher at Titusville marked the beginning of the modern industrial age of oil. Until the early years of the 1900s, oil was used in kerosene lamps for lighting as a substitute for whale oil; however, just prior to World War I it began to be used as a fuel for mechanical engines driving automobiles, trucks, airplanes, and ships.

After World War II, which had been successfully fought by the Allies largely because they had

been able to control oil supplies much better than the defeated Axis powers, the oil companies both large and small began an intense search for oil to fuel the growing postwar recovery.

From 1945 until about 1965 the major oil companies dominated the oil exploration, refining, shipping, and distribution sectors of the oil industry. A vast portion of the market in gasoline sales was in the United States, which held the largest number of automobiles and also had an ever-expanding highway system to serve its mobile population. Oil companies such as Texaco were television sponsors for a market that was saturated in the 1950s. Gasoline station price wars at times were marked with gifts of inexpensive dinnerware for gasoline purchases. Prices on average were below 30 cents a gallon but in times of severe price competition would drop below 10 cents a gallon.

By the 1960s the European countries had made significant strides toward recovery from the damage done during World War II. Their colonies or former colonies were also growing. The

net effect was significant growth in global oil demand about the time that the United States became an oil-importing country instead of the oil-exporting country it has previously been. As oil demand in the United States and around the world increased steadily, the price of oil began to be affected by political factors.

The oil resource-rich countries, most of which were and are still in the Middle East, began to try to control the market price of oil, forming the Organization of the Petroleum Exporting Countries (OPEC) in 1960 in Iraq in order to further that goal. At first, the goal of the states involved was to increase the yield they received from oil companies, but by the 1970s most were moving to nationalize their oil resources.

OPEC's reaction to the Arab-Israeli War of 1973 led to oil price increases for the world market. The rise in the price of oil per barrel led to a massive transfer of wealth from the industrialized nations in Europe, North America, and Japan. The high cost of oil produced high inflation and stagflation in the United States as well. In response, the Japanese moved quickly to limit their dependence upon oil. A massive development and adoption of energy efficient equipment was adopted. Japan also invested heavily in energy sources such as nuclear power and geothermal power. Europe, and the United States in particular, did not follow the Japanese example after oil prices dropped to much lower levels.

In the Middle East, much of this wealth was spent on weapons and wars and went for private gain. However, some of the oil revenues of small Arab states such as the United Arab Republic and Kuwait were put to use building a vast infrastructure that transformed their main cities into modern cities with schools, businesses, shopping malls, and more.

By the mid-1980s oil prices dropped to below \$20 a barrel as more supplies came on line. The next ten years were a decade of relatively stable oil prices and growing prosperity in the post-Cold War world until the terrorist attacks upon the United States in September 2001. The American wars in both Afghanistan and soon afterward Iraq were coupled with a huge increase in the demand for oil as China, India, and other countries grew significantly in prosperity. There

transportation systems began to demand much more oil as supplies became tight.

In 2007 and 2008 oil traders entered into a series of bidding wars for oil contracts that drove up the price of a barrel of oil. The peak came in the summer of 2008 when the price of oil drove the cost of gasoline to over \$4.00 a gallon in much of the western United States and to well over \$3.00 a gallon in much of the United States east of the Mississippi River.

The price of oil may well have remained at the record high levels set in 2008 had it not been for the financial collapse that occurred in September 2008 when the housing market crashed, generated by overextensions in the subprime lending markets.

Even as the price of oil declined after the summer of 2008, the issue of peak oil (or the point at which half of the recoverable oil in the world has been found and used) was disturbing many people who try to plan for the future. A range of views on the question of when oil production will peak includes those who believe that it already has to those who believe that this is a distant future event.

—Jack Waskey

Oil Demand since 1945

The world demand for oil has grown rapidly over the past century. In particular, the rapid growth of the economies in China and India and rising wealth of their citizens in recent decades has resulted in a new and a growing demand for oil. Yet the United States, which consumes about 25 percent of the world oil production, remains the world's leading consumer and is increasingly dependent on a foreign supply. As of 2006, European nations ran second to the United States, using approximately 15.6 million barrels daily compared to 20.8 million used daily in the United States, 6.6 million used daily in China, and 5.4 million barrels per day used in Japan.

In the early 1950s the United States was the world leader in the production of oil, producing more than 5 million barrels per day. At the time there was little concern about an end to the supply. The world's proven reserves were less than 100 billion barrels, and the United States

➤ OIL COMPANIES AND THE ENVIRONMENT

Major petroleum producers are heavily criticized internationally for the damage and irreparable harm that oil extraction (and much-publicized oil spills) inflicts on the environment. Companies such as U.S.-based Chevron, British Petroleum (BP), and Royal Dutch Shell have been proactive in responding to these critiques through public relations campaigns and advertising that depict them as responsible stewards of the environment and promoters of carbon efficiency and energy conservation. While this has led to further criticism by various nongovernmental organizations and environmental activists of greenwashing, it has also resonated with consumers who want to associate with products and services that minimize or restore environmental damage. Chevron Corporation in particular promotes energy conservation and responsible extraction practices, which have proven to be a boon to restoring its image domestically in the United States. However, while these public relations campaigns have proven helpful to oil companies and their growing assets, oil extraction and refining continue to be controversial given their continuing peril to the environment.

—Abraham O. Mendoza

held about 30 percent of these reserves. For the next two decades the world production of oil increased at a rate of 10 percent per year. The U.S. production continued to increase but peaked in 1970 at just under 10 million barrels per day. The date of this peak and the subsequent decline in production were accurately forecasted by Marion K. Hubbert. Hubbert, a geologist working in the Exploration and Production Research Division of Shell Development Company, made public in 1956 his calculations accurately predicting the peak of U.S. oil production at or near 1970.

Even as early as 1970 at the peak of U.S. production, the United States was highly dependent on foreign oil. At this time oil provided the United States with about 44 percent of the total energy used. This consumption of 5.4 billion barrels was equivalent to 1,100 gallons of oil for every person in the United States. The amount of oil imported represented about 23

percent of the total U.S. consumption. This gap between what the United States produced and consumed has grown over time as U.S. production has continued to decline while demand increased. The price of oil remained at around \$12 a barrel (in constant 1994 prices) from the turn of the nineteenth century up until the 1970s, when the price of oil rose dramatically.

The spike in oil prices in the 1970s was a result of oil production cutbacks by OPEC (Organization of Petroleum Exporting Countries) nations. OPEC was formed in 1960 with a goal of regulating the production and price of oil. The members of OPEC with the largest crude oil reserves are Saudi Arabia, Iraq, Kuwait, the United Arab Emirates, and Iran. Saudi Arabia's reserves, at more than 260 billion barrels, are double that of the next largest OPEC member and represent 22 percent of the world's proven reserves. Non-Middle East countries with large reserves include Mexico with more than 50 billion barrels, Russia with more than 55 billion barrels, and Venezuela, which is a member of OPEC, with more than 65 billion barrels. Even with the large oil fields in Alaska, the United States has less than 3 percent of the world's proven reserves.

The success of OPEC to maximize its members' profit has been spotty at best. In 1973 and again in 1979 OPEC cut production, and this resulted in a quadrupling in the price of oil. These price shocks resulted in recessions and severe disruptions in the world economy. In the short run this increased OPEC's profits, but over time the growth in the demand for oil slowed dramatically as energy efficiency became a much greater concern. The demand for oil slowed to less than 1 percent per year from the first oil shock until the mid-1990s. Except for a brief spike in the price of oil during the Gulf War in 1991, the price of oil remained relatively stable at about \$20 a barrel until the turn of the century.

Since the turn of the twenty-first century, a number of events such as the 9/11 terrorist attack on the World Trade Center in 2001, the U.S. invasion of Afghanistan during 2001–2002, and the Iraq War beginning in 2003 have caused uncertainty that has affected oil prices. Along with these events, the sustained increase in the price of oil from 2002 through 2008 has been caused by rapid increases in the demand for oil

by developing nations and China coupled with capacity constraints of the major oil producing countries.

Not anticipating this demand, the major oil producers have not been able to increase capacity fast enough. The price of oil reached above \$100 a barrel (not adjusted for inflation) in 2008. With the price of oil reaching record levels, there has been a renewed concern that the world's oil supply is running out. With the exception of Hubbert's predictions about the U.S. oil supply, however, forecasters over the past 50 years have failed to predict world trends correctly. Although the number of easy oil hits (that is, new fields close to the surface in readily available locations) are rarer, improvements in technology have allowed for profitable oil production at ever deeper levels and more difficult locations. Geologists estimate that the recoverable oil from tar sand in Canada and shale rock in Colorado is larger than all proven reserves of Saudi Arabia. With the technology available today, it may soon be profitable to use these alternative sources. In addition, oil demands should be lessened with continued improvements in energy efficiency and increased use of non-fossil fuel energy sources such as nuclear, solar, and wind.

Oil Fields Globally

Oil (petroleum) is found around the world in sedimentary rock formations. In many places petroleum seeps from deposits near the surface. Many of the first oil strikes occurred where natural oil seeps pointed to oil deposits. Since at least the 1950s most of the easily found oil is believed to have been discovered. The quest for oil has revealed many giant fields (over 500 million barrels); however, they number less than 1,000.

➤ PEAK OIL THEORY

Since the end of World War II, the global demand for petroleum has increased as many countries around the world acquired an appetite for oil due to massive economic development. As the world's supply of petroleum is finite, increased demand has led to various theories of when petroleum extraction would reach its peak, after which the rate of production would enter into decline as a result of dwindling supplies. M. King Hubbert (1903–1989), an American geoscientist, is credited with developing the Hubbert peak theory in 1956. Hubbert predicted that U.S. oil production would peak in the early 1970s, given the projected capacity of U.S. oil fields. Most experts would agree that as predicted, U.S. oil field production did peak in the 1970s. Subsequent theories, some modeled on Hubbert's theory, have attempted to predict the peak for global oil supplies. Some of the most pessimistic theories have estimated mere decades, while the most optimistic predicted at the very least a century. While the accuracy of these projections remains controversial, it illustrates the growing concerns regarding oil dependency across the Western world.

—Abraham O. Mendoza

All together there are about 40,000 significant oil-producing areas around the world.

The giant oil fields are concentrated in about 27 regions of the world. The largest concentrations are in the Persian (Arabian) Gulf area and the western Siberian basin. Other concentrations are in Venezuela, Mexico, Nigeria, the Caspian Sea region, the Gulf of Mexico, North Africa, the continental United States, Canada, and Alaska. They are usually found at the edges of ocean basins or in rift environments (cracks in the earth's crust).

Since 1945, the supply of oil for gasoline or heating oil has oscillated through cycles of boom and bust. The discovery of the giant Ghawar oil field in eastern Saudi Arabia by American geologists in 1948 revealed the largest-known field in the world. Between 1960 and the early 1970s the number of giant fields discovered peaked and declined thereafter. Still, a number

of giants were discovered in Angola, Nigeria, Algeria, Libya, and Equatorial Guinea and in the 1990s in Saudi Arabia.

Among the largest fields in Saudi Arabia are the Safaniya field discovered in 1951, the Manifa field discovered in 1957, and the Zuluf field discovered in 1965. Other large field discoveries include the Muran field in Iran (1953), Prudhoe Bay in Alaska (1969), Samotlor in Russia (1961), the Cantarell Complex in Mexico (1976), Cusiana/Cupiagua in Colombia (1991), Ourhoud in Algeria (1994), and Roncador in Brazil (1996). Between 2000 and 2007, 79 new giants were found in places such as the Kashagan field in Kazakhstan (2000).

Many previously ignored sites are being searched at increased drilling depths. Recent discoveries of oil under the Baaken Shale formation in the badlands of North Dakota and Montana suggest a new giant field holding billions of barrels of oil. The oil is at a depth of two miles. Other recent explorations have been under the sea nearer to the edge of the continental shelf in ever deeper waters or under the Arctic ice cap. Potentially billions of barrels of oil are in these as yet unproven fields, such as a recently identified deep-water Atlantic field off the coast of Brazil.

Both the Antarctica and the Arctic are major regions that have not been explored for oil. In 2007 Russia claimed the entire Arctic as its oil field. This claim has been dismissed by Canada. Geologists expect that giants will continue to be found in regions not previously examined or in reexamination of older areas. Until the global financial crisis of 2008 the world's consumption of oil was rising rapidly, leaving many to predict an end to oil in a few decades at most.

Organization of Petroleum Exporting Countries (OPEC)

The Organization of Petroleum Exporting Countries (OPEC) was founded in 1960 by countries whose primary source of income flowed from the sale of petroleum, particularly to the West (i.e., the United States, Europe, and Japan). Its founding nations included Venezuela, Saudi Arabia, Iran, Iraq, and Kuwait, and its ranks later included Algeria, Indonesia, Ecuador, Libya, Nigeria, Gabon, Qatar, the United Arab Emirates, and, most recently, Angola, which joined in 2007. OPEC was established with the intention of creating a unilateral policy to promote the mutual interests of member nations and to counter the power of multinational oil companies to set prices and control the industry. OPEC's control of the majority of the world's oil has allowed it considerable influence in international affairs, the most evident case being its role in causing the Oil Crisis of 1973 as a response to American and Dutch support of Israel in the Yom Kippur War against Egypt and Syria. However, OPEC's position as a major agent in world affairs has dissipated in recent decades due to greater access to alternate sources of energy and non-OPEC production.

In the first half of the twentieth century, American and British oil companies were responsible for the discovery and exploitation of petroleum resources in various world regions. The majority of the wealth was extracted for the benefit of such companies (Standard Oil, Exxon, Texaco, British Petroleum), leaving a fixed percentage of corporate profits to the countries where the oil was taken. In the 1940s, Venezuelan minister of mines and hydrocarbons Dr. Juan Pablo Perez Alfonso advocated greater collaboration among the world's oil-producing nations in order to increase their share of oil export profits and thus retain a substantial portion of the wealth for the benefit of their countries. In 1959, Alfonso attended the Arab Petroleum Conference to encourage unity between Venezuela and the Middle Eastern oil producing countries. OPEC was inaugurated the following year in Baghdad at a conference that included the founding members of Venezuela, Iran, Iraq, Saudi Arabia, and Kuwait.

Throughout much of the 1960s, OPEC focused much of its efforts on negotiating concessions from the multinational oil companies primarily over production issues, taxation, and world prices. This resulted in greater OPEC control of production and pricing while allowing the oil industry to retain control of the marketing and transport of petroleum. OPEC shifted its attention to creating production quotas for member nations in order to stabilize world prices for petroleum, ensuring the benefit of all OPEC members. In the next decade, OPEC expanded to include the new member nations of Qatar (1961), Indonesia (1962), Libya (1962), Ecuador (1963), the United Arab Emirates (1967), Algeria (1969), Nigeria (1971), and Gabon (1975), all seeking to extract their own concessions from the multinational corporations working within their borders.

The outbreak of the Yom Kippur War of 1973 infuriated OPEC's Arab nation members. Outraged over the continued aid provided by the West to Israel, the Arab nations set a petroleum embargo on the United States and much of Western Europe. The major oil industry conglomerates suddenly found themselves at the mercy of OPEC and its demands for higher oil prices for the world market. However, the threat of OPEC's power over vast amounts of the world's oil supply led to Western nations' awareness of their own vulnerability. Developed nations began to seek oil supplies elsewhere, particularly from non-OPEC countries such as the Soviet Union and Mexico, and to rely on their own sources of oil to avoid being coerced by OPEC and its foreign policy demands.

Rising oil prices have resulted in a huge influx of money into OPEC countries, which has been a mixed blessing for the member nations. Many OPEC governments have failed to invest much of this capital in their own countries, choosing to invest abroad (particularly in Europe and the United States) or to provide aid grants to non-Western developing countries to generate support for their international economic policies against the West. The dependence on oil as the primary source of generating national income failed to give the majority of OPEC nations economic independence; OPEC nations still needed

➤ THE 1973 OIL CRISIS

Cars line up in two directions on December 23, 1973, at a gas station in New York City at the height of the oil boycott crisis of 1973. Motorists waited in long lines and paid high prices for gas when the Organization of Petroleum Exporting Countries (OPEC) declared an oil embargo on the United States in October, 1973. (AP/Wide World Photos)

The Organization of Petroleum Exporting Countries (OPEC) declared an embargo on the United States and the Netherlands in response to continued Western aid to Israel during the Yom Kippur War of 1973. OPEC also raised prices for much of Western Europe by as much as 70 percent. Within the United States, the embargo created an energy crisis that grew considerably worse through much of that same year. Gasoline prices skyrocketed, and long lines of cars began to form at filling stations as consumers waited, often at empty pumps.

Even with the end of the oil embargo in 1974, high gasoline prices remained. The dislocation of the global economy resulted in the breakdown of the existing Bretton Woods economic order as the United States sought to remove itself from the gold standard to rescue its economy. A period of sustained inflation in much of the developed world resulted in growing unemployment, particularly in Western Europe. The 1973 Oil Crisis ended the sustained economic growth of the postwar decades, ushering in a period of global economic instability that lasted well into the 1980s.

—Abraham O. Mendoza

to purchase products and industrial equipment from the West, resulting in the eventual granting of concessions for trade credits (increased oil exports in exchange for Western consumer goods) and a gradual loss of international power.

Disagreements over quotas have led members to withdraw from OPEC. For example, Ecuador withdrew in 1992, and Gabon withdrew in 1996. Currently, Indonesia's membership is under review given its position as a net importer of petroleum. In recent decades, OPEC has continued to function as a mediator for the global interests of the major oil-production countries albeit with lesser international influence.

Oil Fuels in Latin America

The desire of governments in Latin America to promote and, at times, control national economic growth highlights the changing nature of the oil industry in Latin America during the twentieth century. A general movement in favor of oil nationalization from the 1920s through the 1970s preceded a shift toward privatization that began in the 1990s. In between these two eras, the 1973 Oil Crisis stimulated investment in state-run oil companies through loans for exploration and development of previously untapped oil reserves, which in the 1980s resulted in a series of debt crises for many Latin American nations. The politics of neoliberalism promised to resolve these issues by privatizing state-controlled monopolies and utilities. In the 1990s nearly every state-run oil company in Latin America opened up to private investment, although the degree to which this took place varied according to the particular political, economic, and environmental conditions of each nation.

The nationalization of oil deposits, which began in 1922 with Argentina and ended in 1976 with Venezuela, was legally possible because in

Latin America the sovereign nation owns the subterranean mineral rights, which are separate from the surface rights. This is a legacy of the Spanish colonial legal tradition that assigned ownership of underground resources such as gold and silver to the Crown, rights that were later transferred to the newly independent nation-states. This is also in contrast to former Anglo-Saxon colonies such as the United States in which mineral rights may be separated from surface rights but are nevertheless not explicitly the property of the nation or its people.

Generally speaking, the nationalization of oil served five general purposes for Latin American governments. First, the state-owned oil company was at the top of the national economy and led the way to national economic self-sufficiency. States that integrated development, financial, and military programs into an overall industrial policy typically relied upon the control of the nation's oil industry. Second, the nationalized industry promoted private industry by providing a basic infrastructure that produced inputs for the industrial sector at attractive prices. This logic promised that cheap state-produced oil fuel would underwrite economic development. Third, in a related area, the state-as-oil-company acted as an industrial entrepreneur and spurred growth in related industrial sectors. Fourth, the nation set an example by operating an industry according to the state's idealized social and labor policy. Finally, the nation cultivated within its oil industry a large group of public employees with a vested interest in maintaining state control over both the industry and the economy.

Financing additional oil exploration remained a problem for the region up until the 1970s. Many states nationalized their industries in response to dwindling foreign investment, which after World War II focused on developing oil fields in the Middle East. Over time, the tendencies toward increased nationalization of the oil industry and declining foreign investment in the region became mutually reinforcing. As more Latin American nations appropriated privately held oil infrastructure, foreign corporations became less attracted to investment in those countries that had yet to nationalize their oil industry. As a consequence, nations looked at nationalization as a way to consolidate multiple

private companies into one state-owned enterprise that would reinvest its profits into further development. From the state's point of view, sustained economic growth depended upon a steady increase in cheap oil fuels for domestic use, an increase that could only come from further investment in exploration and infrastructure expansion.

Although Mexico and Venezuela successfully improved their nationalized oil infrastructure without the aid of private investment, other countries with quantitatively smaller oil reserves such as Peru, Argentina, Bolivia, Ecuador, and Colombia balanced their desire for national control over oil with the need for increased exploration and production. In these cases, foreign investment eventually augmented state resources after nationalization had taken place. While a certain amount of state-financed exploration took place, the high costs and difficulties often imbued such projects with limited value. As a result, nations other than Mexico and Venezuela remained dependent on international arrangements despite the nationalized character of their oil industries. Furthermore, prior to the 1973 Oil Crisis and its aftermath, most international companies would only agree to explore for oil provided a concession contract gave the company nearly complete control of development.

However, after 1973 a transformation in the international oil market changed the basis on which states undertook oil exploration and development. Three key worldwide developments strengthened this shift in the oil industry. First, a number of countries acquired foreign investment under favorable terms in part because international oil companies feared that an unsatisfactory outcome in one location might have unwelcome implications internationally. Second, credit for oil industry development became more readily accessible to state-run companies, and World Bank assistance also became available for oil field development for the first time. Finally, the overall growth in the oil industry increased the number of companies specializing in refineries, pipelines, transport terminals, and petrochemical plants, which drove down costs and increased the options for public-private partnerships.

The resulting oil industry boom lasted over a decade, but by the late 1980s struggling econo-

mies led many Latin American policy makers to believe that the state-directed development model had reached the limit of its power. The immense amounts of government debt that had accumulated with the expansion of state-owned oil industries hobbled many national budgets. As a solution, the adoption of neoliberal economic policies, which first began in Chile in the early 1970s, swept through Latin America following the debt crises of the 1980s. Privatization became the remedy to debt-ridden state-run corporations and the centerpiece of neoliberal reform. This change also reflected the new preeminence given by policy makers to the private sector and the role of market forces in achieving sustainable economic growth.

Consequently, many Latin American states privatized state-owned oil companies or removed the state monopoly on oil production, distribution, and refinement. This process generally involved breaking up the state-run company into smaller components and selling a percentage of the company along with management responsibility to private interests. For example, the privatization of Bolivia's Yacimientos Petrolíferos Fiscales Bolivianos (YPFB) began with the passage of the 1994 Capitalization Law, which allowed the state to sell 50 percent of the company to private investors. Bolivia subsequently divided YPFB into two upstream units, a transport company, a refining company, and several service companies. Bolivia privatized the two upstream units in 1996 and the transport company in 1997. In a more extreme case, Argentina sold 99 percent of its state-run oil company to the Spanish conglomerate Repsol S.A. However, in Mexico the 1992 restructuring of PEMEX into four decentralized divisions did not lead to foreign ownership or investment.

■ Introduction: Shadow Economies

Shadow economies are also sometimes known as underground economies, parallel economies, or black markets. They are markets in which trades are made without taxes being collected, labor laws are evaded, environmental laws are avoided, or some type of prohibited service or commodity is sold.

Shadow economies can exist as mild forms of tax evasion in many countries where goods or services are traded without taxes being collected. For example, if a guest in a bed and breakfast (B&B) inn pays in cash, the B&B operator might pocket the payment, ignoring sales or tourist taxes. In that instance, the B&B operator, especially if the paying guest is a foreigner, safely evades declaring the room rent as part of the B&B's business income, which is subject to taxation, and the guest evades paying the taxes due. Both save a small sum that would have gone to the government. Many other types of shadow economies may be in countries where tax collecting is more easily evaded than in the United States or in other industrial societies. In the same way, hired laborers in restaurants and other service industries may be paid off the books, without taxation. In the United States alone, the underground economy is estimated to run into the billions of dollars every year.

Black markets are another form of shadow economy. These black markets operate at times in the open but often exist deeply underground. There is often violent conflict associated with them. The value of the commodities that black marketers sell is often quite high. The black markets includes guns, diamonds, oil, human body parts, human babies, the smuggling of humans into countries as illegal laborers, pirated goods, stolen goods, stolen art, archaeological artifacts, cattle, sheep, illegal drugs (such as cocaine or opium), imitation pharmaceuticals, exotic animals or exotic animal parts (for example, elephant ivory), nuclear materials and nuclear technology, alcohol, and more. Black markets in currencies or services such as gambling or prostitution are common businesses in shadow economies.

Other shadow economies deal in the more unseemly or violent activities, for instance, the

diamond trade. Murder-soiled diamond production has plagued Africa after the end of colonialism. By the 1990s trafficking in conflict (blood) diamonds taken from mines dominated by rebel groups provided them with money for weapons and supplies. Sometimes armed gangs would enter a diamond-producing area and would deliberately mutilate a hand or a foot of men, women, and children in order to brutalize them psychologically and physically. Terrorist groups, including al-Qaeda, joined in the great profits to be made from smuggling rough diamonds to diamond centers for cutting and polishing before entering the public diamond markets.

In November 2002 a global movement among nongovernmental organizations (NGOs) and other activists pressured the diamond industry and the governments of diamond-producing countries to take action on conflict diamonds. After a meeting in Kimberley, South Africa, the Kimberley Certification Process Scheme was adopted. In August 2003 the Kimberley Process, a joint government, international diamond industry, and civil society initiative for stemming the flow of conflict diamonds, was instituted.

By 2006 nearly 4 million Africans in Sierra Leone, Liberia, Angola, and the Democratic Republic of Congo had been killed because of conflict diamonds. The International Criminal Court has sought to prosecute as war criminals warlords, gun runners, and corporate executives selling conflict diamonds and purchasers with involvement in genocide.

The common element in all illegal markets is an attempt to evade government control, whether the goods sold have been legally purchased or stolen. As an example, the government goal may be to collect taxes on transactions that people do not accept as legitimate or to ban some product or a service that is believed to be unhealthy or dangerous.

Black markets are the common link between all pirates throughout history. No matter how pirates of the Caribbean in the sixteenth through the eighteenth centuries may be romanticized, they share with modern Somali pirates, and others, the fact that they are criminal bands orga-

nized to steal on the seas or elsewhere. Modern so-called designer pirates have intelligence networks that identify ships and their specific cargos that are the most valuable to steal. After a successful act of piracy, the goods, including the ship sometimes, are sold in a black market.

Crime organizations, such as the criminal gang run by Al Capone in Chicago during Prohibition, often develop where there are black market opportunities. In the long run they are also able to gain the support of law enforcement, usually at a price. Shadow economies tend to be large and more important in countries where economic liberty is reduced.

Of growing importance in recent decades is the black market of making and selling of counterfeit goods. These are often imitations of expensive brand name goods that are sold at a profit to those making the imitation. Intellectual piracy (for example, the sale of movie DVDs) is often practiced in black markets that are global in scope.

—*Jack Waskey*

Crime Organizations since 1945

Since 1945, international crime organizations have expanded despite the efforts of individual nation-states, international cooperation, and transnational police entities (such as the International Criminal Police Commission, or INTERPOL) to curtail their business. The global expansion of shadow economies based from the profits of these organizations at times make a considerable portion of national wealth, albeit indirectly, for some developing states. While international criminal organizations preceded this period, since 1945 such groups have expanded due to immigration patterns (South to North), the increase of drug and human trafficking, and the augmented level of cooperation of these organizations with civilian populations and corruption in governments in developing nations. In countries such as Colombia, Mexico, Afghanistan, and Somalia, crime organizations have increasing levels of autonomy in areas of those respective states, amounting to quasi-political and economic control. Moreover, crime organizations such as the Sicilian, Russian, Israeli, and Japanese (Yakuza)

mafia have transnational syndicates due to their respective diasporas.

International immigration in the post-1945 world from the developing world to the West has led to the establishment of transnational crime organizations between the country of origin and the host country. Mexican and Colombian drug cartels have connections with street gangs in the United States, particularly in major cities such as Los Angeles and in state prisons. Through intricate indirect and direct communication channels, the smuggling and pricing for narcotics is coordinated, with differing levels of autonomy for the various street gangs. Given the competitiveness of cartels and gangs, turf wars often lead to violence, either in gang warfare at the street level or wide-scale gun battles between cartels. More recently, drug cartels in Mexico and Colombia with their own armed militia groups have engaged with the military forces of the national government, often with popular support in regions of drug cultivation. Moreover, government corruption at the local and national levels often leads to overt bribery, overturned convictions, and indifference. For example, drug cartels in central and southern Mexico, particularly in the state of Michoacán, have substantial support from local populations vis-à-vis the federal government and the antidrug efforts of President Felipe Calderon. Similarly, in the Taliban-held areas of Afghanistan, poppy growers are supported by the Islamist Taliban as a means of acquiring currency to purchase weapons through the global heroin trade to the West to fight North Atlantic Treaty Organization (NATO) forces.

Transnational mafia families in the West have also expanded their international economic powers, particularly the Russian mafia. After the fall of the Soviet Union and the migration of Russians to Europe and the United States, the Russian mafia has expanded its base of operations. Drugs, arms, and human trafficking (particularly slave-prostitutes from the former Eastern Bloc) have been traded across much of Europe, the Middle East (based in Tel Aviv), and Asia through their myriad networks and families based in major cities. To a lesser extent, Sicilian (Italian), Israeli, and Japanese crime families have also expanded throughout much of the West in similar rackets as those of the Russians, with levels of

involvement in gambling, counterfeiting, and extortion. The power exerted by mafia networks, while sometimes limited to the local diaspora community in the city base of operations, often engenders turf wars with adjacent crime organizations and conflicts with local governments.

Other forms of international crime organizations are based in failed states (Somalia and Afghanistan) or are operated by nonstate actors working through the auspices of a rogue state (North Korean hackers) or terrorist networks (al-Qaeda). Somali pirates off the coast of the Horn of Africa have made substantial profits from ransoms and hijackings of shipping freighters going to and fro from the Persian Gulf in spite of Western naval efforts to curtail their actions. Cybercrime by North Korean and al-Qaeda hackers to deliberately slow down intelligence agencies and steal delicate information, in addition to cybercrime by other petty hackers (who focus on identity theft, password theft, Internet scams, and usurpation of funds), has increased by leaps and bounds in the past decade as a means of acquiring money and for intelligence gathering.

Drug Trafficking

While international drug trafficking has been a significant form of transnational exchange for centuries (e.g., the opium trade between India and China in the nineteenth century under British auspices), in the period following the end of World War II this trade has expanded exponentially. Contemporary drug trafficking is directly related to globalization, characterized by its components of mass migration, transnational diaspora networks, international trade networks, and the emergence of transnational criminal organizations (such as Chinese Triads, the Russian Mafia, and Colombian drug lords). After 1945, as economic disparities between the developed West and the developing postcolonial world pro-

gressed, the illicit international drug trade became a viable way for various world regions (Latin American countries of production such as Mexico and Colombia, the Southeast Asian Golden Triangle, and the Central Asian Golden Crescent) to accumulate wealth while satisfying the demand for heroin, cocaine, and marijuana in the West. The relationship between global drug trafficking networks and government corruption at all levels in drug-exporting countries (such as Mexico, Colombia, Afghanistan, Laos, and North Korea) further complicated international attempts to stem the transnational trade in illegal drugs and narcotics.

After 1945 the emergence of transnational drug cartels took place in the West in relation to immigrant communities with links to drug-producing home countries. In this period heroin, a derivative of opium, was heavily in demand by drug users. Beginning in the late 1940s, the Sicilian Cosa Nostra (Mafia) in major U.S. cities used skills learned during the 1920s Prohibition era to smuggle heroin into the country by utilizing their connections in Italy (Sicily). Similarly, the Corsican Mafia utilized its transnational connections spread out within the late French Empire, funneling heroin from French Indochina (Vietnam, Laos, Cambodia) into the French port of Marseilles, where it was distributed into Western Europe. These early transnational trade diasporas created a cohesive international trade network that relied on foreign producers for product but was responsible for smuggling and distribution in the country of consumption.

Much of this heroin was purchased from local opium producers in Indochina with links to the Chinese Nationalist Army in the nascent Golden Triangle in Southeast Asia. In the late 1940s the Chinese Nationalist Army, fleeing from the Chinese communist forces, developed opium farming in Southeast Asia—an area since named the Golden Triangle—to fund their counterinsurgency activities. The governments in Burma, Thailand, and Laos allowed the development of the opium trade within their states for local economic development and eventual sale into established regional markets in neighboring China and Hong Kong. This trade network established Bangkok as the center of the international heroin trade for decades. In the mid to late 1960s,

U.S. involvement in Vietnam introduced a significant amount of American soldiers to heroin use (popularly known as “chasing the dragon”). Ironically, U.S. allies in Vietnam made a sizable profit in the distribution of heroin to American GIs, who managed to spread the heroin habit (along with the trade in heroin) to countries where they spent their rest and recuperation time (Taiwan, Hong Kong, South Vietnam, and Japan). Also, these GIs inadvertently established heroin in the United States on a wider scale upon their return stateside, further cementing the link between the Golden Triangle and the United States. Diaspora Chinese communities in Southeast Asia developed transnational criminal organizations responsible for distribution (known as the infamous Triads), with the networks spreading to places such as Australia, New Zealand, and the United States with sizable Chinese immigrant communities

The growth of the marijuana and cocaine trade, which became widespread in the late 1960s in the West, fueled cultivation of these crops in the Latin American countries of Colombia, Bolivia, and Peru. These developing countries, already dependent on cash crops, created lucrative drug empires by exploiting the West’s demand for drugs. Countries of transit such as Mexico, with its proximity to the United States, also developed localized drug production cartels, which relied on its diaspora communities (typically in the form of Hispanic street gangs in urban and rural areas) in the United States for distribution. Mexican drug lords also recognized the potential for the marijuana trade, cultivating it in huge plantations in secluded areas impervious to the authorities who were typically already bribed. National governments in Mexico and Colombia, recognizing the growing power of drug lords (*narcos*), were reluctant to confront them because it would expose them to the high level of internal corruption that plagued their own bureaucracies. The international U.S. war on drugs in the late 1980s and early 1990s was an effort to work together with countries such as Mexico and Colombia to destroy the supply side of the international drug trade. While this lessened the amount of drugs trafficked into the United States, it inadvertently created domestic drug cultivation operations (most famously

➤ DRUG LORDS—COLOMBIANS

Since the late 1970s, Colombia has been the world’s largest producer of cocaine and also a large producer of marijuana and heroin. It is not surprising that extensive criminal gangs have organized into cartels to control Colombia’s drug traffic into the United States and Western Europe.

In the 1980s, the most powerful and violent of these cartels was centered in Medellín. Led by Pablo Escobar, Jorge Luis Ochoa, and Carlos Lehder, the Medellín Cartel first attempted to present itself as a beneficent organization that employed the poor and provided them with social services. But when Colombian politicians and law enforcement officials demonstrated a renewed determination to stem the drug trade, the Medellín Cartel began to conduct terror bombings and assassinations. The brazenness of their crimes, culminating in the assassination of presidential candidate Luis Carlos Galán, led to an international outcry over the seeming disintegration of the Colombian state and the intervention of U.S. drug enforcement personnel and other paramilitary forces into the conflict. After a number of melodramatic turns in his negotiations with the government, Escobar was eventually tracked down and killed in a shootout.

After Escobar’s death and the imprisonment of Ochoa and Lehder, the Medellín Cartel lost ground to other regional cartels, the most powerful of which was centered in Cali. These cartels have either allied themselves with the Revolutionary Armed Forces of Colombia (FARC), which has conducted an extended insurgency against the Colombian government, or have created militias to eliminate FARC forces and more directly control large swaths of the thinly populated rural and wilderness areas of the country. The war against drugs in Colombia is similar to other law enforcement efforts to prevent the production and distribution of intoxicants and addictive substances.

—Martin Kich

those of Santa Cruz and Humboldt counties in California). Despite U.S. efforts to stem Latin American drug cartels, Western demand continues to prompt suppliers. Some critics suggest that U.S. policies should instead combat the demand side by encouraging rehabilitation and treatment for drug users.

➤ FRENCH CONNECTION

The French Connection was a famous narcotics case that led to the conviction of major heroin traffickers through the combined efforts of the New York City Police Department (NYPD) and the Federal Bureau of Investigation. The case was called the French Connection because Marseille, France, was the connection point between the poppy fields of the Middle East and the sale of heroin on American streets. In Marseille, raw opium would be processed in secret laboratories into pure heroin that was of a very high quality, usually 85 percent pure heroin. It was then smuggled into the United States for street sales to narcotics users.

The success of the NYPD in the French Connection case was instrumental in developing information that was used to severely damage the Mafia in New York. It also slowed the importation of heroin. The case began on the late Saturday night of October 7, 1961, when two off-duty New York detectives followed two animated party goers from the Copacabana night club to a shabby candy store that they apparently owned. From this beginning the two detectives eventually discovered that drug dealers from France were smuggling nearly pure heroin into the United States. The drug dealers attempted to smuggle 112 pounds of heroin into the United States hidden in the rocker panels of a 1960 Buick Invicta. The car belonged to a French television entertainer, Jacques Angel-

vin, who was a conspirator. The value of the load was approximately \$32 million.

The French Connection case brought attention to heroin-smuggling operations. In the late 1960s French drug dealers were still smuggling in larger quantities of heroin. In December 1965, 200 pounds were seized in Columbus, Georgia. Another 200 pounds were seized in New York City in 1968.

President Richard M. Nixon forced the Turkish government to stop the sale of surplus Turkish pharmaceutical poppy by simply buying it from the registered Turkish growers. Nixon's administration then applied pressure on the French to close the drug labs in France. The short-term impact was the elimination of smuggled supplies. However, the drug dealers soon found alternative ways to reach their markets in America, especially from Southeastern Asia. The purity of smuggled heroin since the French Connection has yet to return to its 85 percent purity.

The book *The French Connection* by Robin Moore (1969) was made into a movie with the same title in 1970 by Twentieth Century Fox. A sequel was produced in 1975. The movie starred Gene Hackman, who played "Popeye" Doyle (the character representing Edward Egan), and Roy Scheider, who played Buddy Russo (the character representing Salvatore Grosso). It won five Academy Awards in 1971.

—Jack Waskey

The Golden Crescent, the mountainous regions of the Central Asian nations of Iran, Pakistan, and Afghanistan, has become a central area for heroin poppy cultivation, with Islamic terrorist organizations and militias among those funding their operations. U.S. CIA operatives assisting Afghan and Arab Islamic militants (such as the Taliban and the militants who would eventually become al-Qaeda) allowed these factions to fund themselves via opium cultivation and the international heroin trade. The widespread destruction left behind by the Soviet-Afghan War (1979–1989) encouraged the further development of opium growing as a lucrative cash crop in the region. The Taliban regime in Afghanistan, while officially opposed to the growth of opium, toler-

ated its existence as a form of accumulating currency to buy weapons and fund operations abroad. The dissolution of the Soviet Union (1991) allowed the creation of the transnational funneling of Central Asian opium (made into heroin in Western Europe) through Eastern Europe. East European nationals, having already suffered the shock of crash capitalism, took to smuggling, production, and distribution in the mid-1990s. Contemporary Russia is now a leading consumer of heroin smuggled from Afghanistan and the greater Golden Crescent. The Golden Crescent is currently the world's largest producer of the world's opium, replacing the former Golden Triangle as the center of the heroin trade.

Intellectual Property, 1945–Present

The development of intellectual property law since 1945 has been dominated by the globalization of the world information economy and the emergence of digital technology. Globalization has brought some uniformity and consistency to international intellectual property law, while digital technology has presented new threats to existing intellectual property rights as well as opportunities for the expansion of the intellectual property economy.

Intellectual property rights are territorial grants of monopoly. They exist and are enforceable only in the territory of the sovereign that grants them or in the territory of some other sovereign that has agreed to respect the first sovereign's grant. In 1945 the regimes of copyright, patent, and trademark were fragmented. Over the next two decades various international administrative and regulatory functions were gathered under the control of a single agency, which in 1967 became the World Intellectual Property Organization (WIPO). The WIPO is responsible for the administration of two dozen multilateral intellectual property treaties. Another organization, the World Trade Organization (WTO), administers the Agreement on Trade-Related Aspects of Intellectual Property (TRIPs).

By 1945 most countries belonged to the Berne Convention, an international copyright treaty requiring members to respect each other's copyrights, but some countries—including the United States—did not. The United States could not join the Berne Convention because the Copyright Act of 1909, which governed U.S. copyrights, was inconsistent with the convention's requirements. To address this problem, the United States pushed for the adoption of another multilateral copyright treaty to create a parallel international

copyright regime. This treaty, the Universal Copyright Convention (UCC), was adopted in 1955. U.S. copyright law was overhauled again with the Copyright Act of 1976. But it was only after the Berne Convention Implementation Act of 1988 that the United States was able to join Berne, bringing about a near-universal copyright regime in which works copyrighted almost anywhere in the world are protected almost everywhere.

Even as copyright succeeded in overcoming problems posed by the global information economy, a new challenge was appearing on the horizon: digital recording. Electronic copying technology had long posed a threat to copyrights in music and movies. In 1984 the U.S. Supreme Court decided, in *Sony Corporation of America v. Universal City Studios*, that the fact that a videotape recorder could be used for copyright infringement did not make the device unlawful. Because videotape recorders were capable of substantial noninfringing uses, they were “staple articles of commerce,” and Sony was not liable for infringements committed by its customers. This rule was to play a major part in later battles over computer file sharing.

Analog copying, resulting in usable but imperfect copies, was worrisome enough for the content industry. Digital copying made possible the creation of an unlimited number of generations of copies with no degradation in quality. United States and international law responded with statutes and treaties aimed at abuses of this new technology. The Audio Home Recording Act of 1992 effectively killed the first digital copying device aimed at home users, the digital audio tape (DAT) recorder. The WIPO Copyright Treaty and the WIPO Performance and Phonograms Treaty, opened for signature in 1996, required WIPO member states to provide protections for digital copies, including laws against circumventing copy-protection technology. And the Digital Millennium Copyright Act (DMCA) of 1998 provided these protections and imposed other restrictions on certain types of online content providers, including educational institutions and Internet radio stations.

While the DMCA protected the interests of content owners, many consumer advocates perceived it as unfair. The DMCA and the Sonny Bono Copyright Term Extension Act, also enacted

➤ FILE SHARING

In the first major battle of the file-sharing wars, in 2000 the U.S. music industry successfully concluded its suit against MP3.com for making copies of CDs it had purchased and placing them on a server for users to access. The next battle was over Napster. Napster had learned from MP3.com's experience and made no copies of files. Instead, it provided software allowing users to exchange music files with each other and a directory service allowing users to search for song titles available on other users' computers. Napster was not a direct infringer because it had copied no songs. Nevertheless, the music industry claimed that Napster was a contributory infringer (knowing of and materially contributing to direct infringement by its users) and a vicarious infringer (receiving a direct financial benefit from direct infringement by its users while also having the right and ability to control those users' actions). In 2001 the U.S. Ninth Circuit Court of Appeals ultimately agreed.

The *Napster* decision spurred software developers to create a file-sharing network that did not require a centralized directory by placing the directory on the users' computers. This required that some users' computers act as supernodes, maintaining lists of available files on other computers on the network. Supernode-based systems (such as Kazaa or Grokster) operate beyond the control of the company distributing the software; the company should thus be neither a contributory nor a vicarious infringer. The Ninth Circuit in the *Grokster* case initially agreed with this reasoning, but in 2005 the U.S. Supreme Court held that inducement to commit copyright infringement could also satisfy the requirements of contributory infringement. Nor was supernode software protected by the staple article of commerce doctrine. Unlike the videotape recorders in *Sony*, the software did not have a substantial noninfringing use.

For the moment, the content industry can claim victory in the file-sharing wars, but the emergence of new technologies, such as nonprofit BitTorrent with its substantial noninfringing uses, suggests that new battles may lie ahead.

—Aaron Schwabach

in 1998, helped transform the formerly obscure field of copyright law into a battleground between consumers and content owners. The tensions between consumers, who want greater freedom to use the content they have purchased, and content owners, who fear that any permitted copying opens the door to widespread piracy, have not yet been resolved and will probably define the future development of copyright law.

Patent law has not yet achieved the near-seamless, near-universal coverage of copyright law. A patent in the United States, for example, provides no protection against infringement in other countries. An inventor must apply for patent protection in every country in which protection is sought. Prior to 1970, this could be extremely difficult. The 1970 Patent Cooperation Treaty (PCT) allows an inventor to file a single patent application and have it simultaneously submitted in any or all of the countries (138 as of January 2008) that are parties. A separate application fee must still be paid for each country. While the PCT does not guarantee that the patent will be granted in all, or even in any, of the countries in which it is sought, it makes the multiple-application process far simpler. TRIPs has also aided in the globalization of patent law, providing more or less uniform terms of patent protection.

Computer technology provided challenges for patent law as well. In the 1960s the U.S. Patent and Trademark Office (USPTO) and the 1966 President's Commission on the Patent System opposed the idea of software patents. In 1972 the U.S. Supreme Court held, in *Gottschalk v. Benson*, that a mathematical algorithm used in a computer program was not patentable. This was widely, if incorrectly, understood as meaning that computer programs were unpatentable and had echoes outside the United States. To this day the European Patent Convention provides that computer programs are not patentable. U.S. patent law is increasingly at odds with that of other countries. The grant of U.S. patents for such "inventions" as a crustless peanut butter and jelly sandwich, a method of swinging on a swing, and teasing a kitten with a laser pointer have given the USPTO an international reputation for laxity. International disagreements over software and business method patents also persist.

Trademark law was the first area of intellectual property to receive significant attention in the United States in the post-1945 era. In 1946 Congress enacted the Lanham Act to modernize, simplify, and unify existing federal trademark law and to comply with international obligations. The threat of counterfeit trademark-infringing goods originating outside the United States led to the Anticounterfeiting Consumer Protection Act of 1996. In 1995 the controversial Federal Trademark Dilution Act provided remedies for holders of famous marks (such as the golden arches of McDonald's or the red-and-white Coca-Cola logo), even in the absence of actual infringement, against those who used the same or similar marks in ways that might blur the distinctiveness of the mark or tarnish it by associating it with something undesirable.

The Internet has had an impact on trademark law as well. The 1999 Anticybersquatting Consumer Protection Act protected trademark holders from Internet users who might register the trademark holders' trademarks as domain names. The advent of the Internet has also given rise to the abuse of trademarks in search engine spamming and fraud.

The international trademark regime is less developed than the copyright regime or even the patent regime. In 2003 the United States joined the Madrid Union by becoming a party to the 1989 Madrid Protocol, which provides a single application process for trademark registrations in all member states. However, with only 82 members as of February 2008, the Madrid Union still leaves more than half of the world's countries uncovered.

Maritime Piracy since 1945

In the decades after World War II, large robust navies patrolling against Cold War enemies coupled with economic prosperity worldwide limited piracy to a handful of areas, chiefly in Southeast Asia. The phenomenon began to grow in the wake of decolonization, starting with the global economic downturns of the 1970s. Yet until the 1980s, incidents of piracy were relatively few, and violence was rare. The ships most vulnerable to attack were anchored or dockside on the coast of Nigeria, and by the end of the decade Nigerian authorities had virtually eliminated the threat, although it subsequently returned at the end of the 1990s.

By that time, piracy had become endemic in parts of Southeast Asia, especially in the Strait of Melaka between Malaysia and Indonesia and in the South China Sea. These regions accounted for a third of the 715 incidents reported between 1995 and 2000. More than half of these involved ships at anchor or on a berth, and 86 percent took place in the territorial waters of one state or another. Many of the victims were fishing vessels that were stripped of their catch, engines, and fittings and their crews' personal belongings, if the ship itself was not commandeered. Thai fishermen, in particular, were implicated in a significant number of attacks on refugees (so-called boat people) fleeing Vietnam in the decades after the Vietnam War.

International attention did not focus on these problems until the 1980s, when pirates in the Strait of Melaka and the South China Sea began attacking large freighters while under way. In several notorious incidents, the crews were cast away or murdered. Southeast Asia remained the region of greatest concern for antipiracy experts until 2008, when there was a sharp rise in piracy around the Horn of Africa in waters adjacent to the failed state of Somalia, which has been without a strong central government since 1991.

► THE ORIGINS OF SOMALI PIRACY

The collapse of Somalia's central government in the early 1990s opened the country's rich coastal and offshore fisheries to illegal dumping and overexploitation by foreign fishing vessels, including factory ships, with which local fishermen were unable to compete. These slow, poorly protected fishing vessels became the first victims of piracy as Somali fishermen sought to protect their own livelihoods, first by boarding fishing boats and demanding compensation, often in the form of fees for fishing licenses. Increased profits from kidnapping ships and crews for ransom encouraged local warlords to invest in piracy. Tankers, cruise ships, and container ships joined the ranks of ships at risk, even when they kept more than 200 miles from shore. Nor did pirates discriminate on the basis of a vessel's registry, and victims have included ships flying the flags of such countries as Ethiopia, Yemen, China, Taiwan, the United States, and Russia.

—Lincoln Paine

Although there were only 11 reported attacks in the first quarter of the year, 135 attacks were registered for the whole year, and 44 ships and more than 600 mariners had been seized.

The conditions that enable piracy to flourish remain fairly constant: an absence of political authority or military will to prevent it, an abundance of shipping to attack, and a lack of alternative economic opportunity for prospective pirates. Which of these factors predominates varies according to circumstances and dictates the nature that piracy takes. A problem of growing concern and complexity at the start of the twenty-first century has been the potential interrelationship among ordinary criminality, piracy, trafficking in drugs, arms and people, nationalist insurgency, and terrorism. However, these are largely discrete enterprises.

Few nationalist insurgencies have effectively used piracy as a means to their ends. People who discriminate in terms of their victims on the basis of nationality—confining themselves to ships belonging to the regime against which they are

rebellious or its allies—do not fall into the ancient definition of pirates as the enemy of mankind. Nor do people who rob ships at anchor have much in common with either terrorists or drug traffickers, who in turn share few aims or means.

Combating piracy is complicated by a number of logistical and legal factors. About 50,000 merchant ships sail in international trade worldwide. While the areas in which piracy occurs appear to be concentrated and limited to strategic waterways, these can be vast. The Strait of Melaka is about 500 miles long and is fringed with innumerable islands in which pirates can easily hide. The Gulf of Aden north of Somalia is a major strategic waterway used by 22,000 ships per year transiting between the Indian Ocean and the Mediterranean. These account for 8 percent of the world's trade and 12 percent of the world's oil. Somali pirates have attacked ships within an area of about 1.1 million square miles (2.8 million square kilometers), roughly the size of the Mediterranean Sea and the Red Sea combined.

As a matter of law, the 1982 United Nations Convention on the Law of the Sea (UNCLOS) defines acts of piracy as those that take place “on the high seas” or “in a place outside the jurisdiction of any state.” Most acts of piracy, however, take place within territorial waters—which extend up to 12 miles from shore—and are tabulated in international statistics on piracy. While some officials might welcome foreign assistance in patrolling these areas, in most cases it is politically untenable to invite foreign-flag navies or coast guards into one's home waters.

Black Markets and Contraband Trade

A global black market is an international circulation of goods that are deemed explicitly illegal by one or more of the countries involved in their production, distribution, and consumption. For this reason it is difficult to impose the notion of a global black market too far into the past, before the existence of strong centralized states, and before international cooperation and law (or at least before the ideas of international cooperation and international law), much international trade would be considered black by our standards. Governments, such as they were, attempted to restrict trade through tariffs and military, usually naval, power.

The first global black market recognizable by these standards was likely the mass importation of Indian opium into China by the British in the mid-nineteenth century. But what makes global black markets since 1945 fundamentally different from anything that came before was that from 1945 onward there were far more international laws and international regulatory bodies. With the founding of the United Nations (UN) and the International Court of Justice (ICJ) after World War II along with the revival of INTERPOL, international law enforcement became an institutional response to international crime.

Post-1945, the most common global black market commodities have been narcotics, weaponry, currency, cigarettes, gemstones, caviar, transplant organs, and, most tragically, human beings. What ties these commodities together other than their illegality? The economist Jagdish Bhagwati makes an interesting distinction between "goods" as opposed to "bads," globally circulating commodities whose destructive powers extend beyond the individual consuming them and into the society in which that individual lives. A bad, in other words, is a commodity that at a given time and place is deemed to cause a social harm. Narcotics such as heroin or methamphetamines,

THE INTERNATIONAL KIDNEY TRADE
